216	Summers, W. H., Serg't, D, 42d Ohio, age 29.	May 19, 1863.	Compound comminuted fracture of right elbow; ball struck olecranon and passed through condyles of humerus.	May 19, 1863.	Condyles of humerus and upper end of ulna excised, by Surg. J. Pomrene, 42d Ohio.	Free motion at elbow joint and some at fingers. Duty Aug. 20, 1863; pens'd. In 1866, Pen. Ex. reports arm no account for labor.
217	Taylor, J., Pt., G, 108th New York, age 20.	Sept. 17, 1862.	Comminuted fracture of upper third of left ulna by conoidal ball.	Sept., 1862.	Three and a half inches of extremity of ulna, by Surg. G. Grant, U. S. V.	Disch'd Jan. 13, 1863; pensioned. Forearm at right angle; able to do light work.
218	*Teal, M. W.*, Pt., K, 26th North Carolina, age 31.	July 3, 1863.	Minié ball carried away portions of radius and external condyle of humerus.	July, 1863.	Excision of elbow joint.....	Disch'd November 12, 1863.
219	Thieme, C., Pt., A, 26th Wisconsin, age 23.	Mar. 19, 1865.	Fracture of right elbow by a conoidal ball; (also wound of neck.)	Mar. 19, 1865.	Excision of joint.....	Disch'd June 28, 1865; pensioned. Anchylosis at an obtuse angle; atrophy; pronation lost.
220	Thomas, H., Pt., K, 81st New York, age 21.	June 1, 1864.	Fracture of right elbow joint by a conoidal ball.	June 2, 1864.	Excision of elbow joint.....	Gangrene. Disch'd December 14, 1864. Not a pensioner.
221	Thomas, W., Pt., L, 13th Pennsylvania Cavalry, age 29.	Mar. 9, 1864.	Fracture of lower third of left humerus by a pistol ball.	March, 1864.	Excision of external condyle of humerus.	Anchylosis. Disch'd April 13, 1865; pens'd. Forearm flexed and pronated; wound discharges pieces of diseased bone.
222	Thuring, C. G., Serg't, C, 1st Maine Cavalry, age 31.	June 19, 1863.	Fracture of condyles of left humerus by a rifle ball.	June 19, 1863.	Excision of condyles of humerus.	Disch'd Nov. 24, 1863; pensioned. Heads of radius and ulna project posteriorly; wound discharging.
223	Titus, C. B., Corp'l, G, 31st Maine, age 20.	July 30, 1864.	Ball through right elbow, carrying away internal condyle of humerus, lodging in back.	July 30, 1864.	Excision of elbow joint.....	Disch'd May 11, 1865; pensioned. Anchylosis of joint; arm useless for manual labor.
224	Titus, S. N., Major, 11th Pennsylvania Cavalry, age 36.	Oct. 7, 1864.	Minié ball; gunshot fracture of lower part of right humerus, involving elbow joint.	Oct. 7, 1864.	Excision of two or three inches lower end of humerus, by a Confederate surgeon.	Partial anchylosis. Disch'd Mar. 11, 1865; pens'd. Forearm and hand paralyzed; limb useless.
225	Tolbert, C., Pt., C, 48th Illinois.	July 21, 1864.	Wound of left elbow joint.....	July 21, 1864.	Resection, by Surg. R. Morris, 103d Illinois.	Disch'd March 22, 1865. Anchylosis; pensioned. Atrophy; no strength in arm.
226	Totman, E. T., Pt., F, 55th Illinois, age 20.	June 27, 1864.	Fracture of right elbow joint by a conoidal ball.	June 28, 1864.	Excision of elb. joint, by Surg. A. C. Messenger, 57th Ohio.	Gangrene; arm amp. Nov. 7, '64. Disch'd April 28, 1865; pens'd.
227	Tracy, A. W., 1st Lieut., F, 111th Penn., age 27.	May 25, 1864.	Fracture of left humerus by grapeshot; (also w'd of side.)	May 25, 1864.	Excision of internal condyle ..	Disch'd May 15, 1865; pensioned. Loss of power and motion in arm.
228	Tracy, W. G., Capt., and Asst. Aide-de-Camp, General Slocum's Staff, age 20.	May 2, 1863.	Fracture of right elbow by conoidal ball, the humerus being comminuted two inches above condyles; two fissures extend into joint.	May 5, 1863.	Four and a half inches lower end of humerus, including condyles, by Surgeon H. E. Goodman, 28th Pennsylvania.	Useful arm; flexion of forearm lost except when olecranon is fixed; perfect motion at wrist. Duty Aug. 15, 1863; pensioned. No bony union. *Spec.* 1155.
229	Tredo, J., Pt., H, 109th New York, age 18.	May 12, 1864.	Fracture of left ulna and radius by a conoidal ball.	May 12, 1864.	Excision of head and upper third of radius, by Surg. W. C. Shurlock, 51st Penn.	Disch'd April 4, 1865; pensioned. Rotation lost; anchylosis; arm entirely useless.
230	Tredway, S., Pt., D, 3d Maryland, age 18.	June 1, 1864.	Fracture of right elbow by conoidal ball.	June 1, 1864.	Excision of elbow.....	Disch'd May 6, 1865; pensioned. No bony union; arm only an encumbrance.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
231	Turner, G. W., Pt., D, 51st Ohio, age 44.	Dec. 16, 1864.	Fracture of right elbow by a shell; humerus comminuted.	Dec. 16, 1864.	Excision of two inches lower end of humerus through six-inch incision.	Disch'd July 10, 1865; pensioned. Unable to flex forearm without aid; cannot grasp or hold.
232	Vanheuren, J. F., Corp'l, F, 86th New York, age 22.	May 12, 1864.	Fracture of right humerus and ulna by a conoidal ball.	May 12. 1864.	Excision of lower third of humerus and three inches of upper end of ulna, by Surg. H. F. Lyster, 5th Michigan.	To V. R. C.; pens'd. Cannot extend arm beyond semi-flexion; cartilaginous union; cannot supinate hand.
233	Wagner, J., Serg't, G, 119th Pennsylvania, age 23.	May 3, 1863.	Fracture of left humerus at elbow joint.	May 6, 1863.	Excision of lower end of humerus, by Dr. Todd, P. A. C. S.	Disch'd Oct. 30, 1863; pensioned. No union; arm atrophied and useless.
234	Walker, W. A., 1st Lieut., C, 146th New York, age 21.	May 5, 1864.	Ball passed through right elbow joint; also wound of back of head and left forearm.	May 5, 1864.	Excision of inner condyle of humerus and head of ulna through a straight incision on posterior aspect.	To V. R. C. Sept. 20, 1864; pensioned. Little power in arm; flexion and extension well performed; rotation lost.
235	Wall, J., Corp'l, D, 169th New York, age 19.	June 1, 1864.	Shot fracture of left elbow; missile passed through joint.	June 1, 1864.	End of humerus excised.....	Disch'd July 7, 1865; pensioned. Complete anchylosis at an angle of 60°; partial paralysis of muscles; arm useless.
236	Watson, R., Pt., K, 8th Connecticut, age 32.	Aug. 18. 1864.	Gunshot wound of left elbow joint; (wounded in left groin Sept. 17, 1862.)	Aug. 18. 1864.	Excision of heads of ulna and radius through an incision four inches long.	No bony union; arm powerless. Disch'd July 31; 1865; pens'd. Arm short, five inches; useless. Died June 27, 1869, of pyæmia.
237	Weber, M., Brigadier-General, U. S. V.	Sept. 17. 1862.	Gunshot fracture of head of right radius.	Sept. 17. 1862.	Excision of three inches of right radius, including head, by Surg. C. Heiland, 20th New York.	Removal of necrosed bone. Resigned May 13, 1865; pensioned. Complete anchylosis at an angle of 95°.
238	Weigle, J., Pt., I, 76th Pennsylvania, age 23.	Jan. 15, 1865.	Wound through right elbow joint by a conoidal ball.	Jan. 16, 1865.	About two inches of ulna, thro' straight incision, by Surg. G. C. Jarvis. 7th Connecticut.	Disch'd June 9, 1865; pensioned. Anchylosis of joint; total loss of use of arm.
239	*Wheelan, P.*, Pt., C, 18th Mississippi, age 32.	July 2, 1863.	Gunshot wound of elbow joint	July 3, 1863.	Excision of two inches of upper end of ulna.	Anchylosis of elbow joint. Furloughed October 5, 1863.
240	Wheeler, D., Pt., B, 2d Infantry, age 39.	July 2, 1863.	Fracture of left ulna, extending into joint, and dislocation of upper end of radius by conoidal ball.	July 3, 1863.	Excision of upper three inches of left ulna.	To V. R. C. May 3, 1864; pens'd. Disease of joint; rotation destroyed; flexion and extension of hand good.
241	Wilcox, H. O., Quartermaster-Sergeant, A, 1st Michigan Cavalry, age 27.	May 27. 1864.	Fracture right elbow and opening of joint by conoidal ball; (also wound of side.)	May 27. 1864.	Excision of external condyle of humerus through a semicircular incision.	Disch'd June 9, 1865; pensioned. Complete anchylosis of joint and atrophy of arm and hand.
242	Wilcox, P. H., Corp'l, K, 50th Pennsylvania, age 40.	June 3, 1864.	Shell fracture of upper third left radius.	June 3, 1864.	Three inches of end of radius, straight incision, by Surg. A. F. Whelan, 1st Mich. S. S.	Disch'd Dec. 14, 1864; pensioned. Rotation lost; no motion of fingers; limb almost useless.
243	Williams, D., Pt., G, 26th Ohio, age 19.	May 29, 1864.	Fracture of left elbow by a conoidal ball.	May 29. 1864.	Excision of neck of radius, by Surg. W. B. McGavran, 26th Ohio.	Disch'd June 13, 1865; osseous anchylosis elbow joint; pens'd. Atrophy of muscles of forearm.
244	*Williams, H. C.*, Pt., D, 13th Georgia, age 32.	July 2, 1863.	Fracture of right elbow joint by a conoidal ball.	July 3, 1863.	Excision of right elbow joint..	Transferred to City Point for exchange Nov. 12, 1864.
245	Wingood, J. H., Corp'l, D, 32d Massachusetts, age 19.	May 12, 1864.	Right ulna fractured at upper end by conical ball.	May 12. 1864.	Excision of upper end of ulna	Disch'd Apr. 27, 1865; pensioned. Erysipelas; gangrene; atrophy; flexion and extension two-thirds; rotation of hand one-third.
246	Wood, J. Y., Pt., I, 1st Maine Cavalry, age 18.	Oct. 27, 1864.	Fracture of internal condyle of left humerus by conoidal ball.	Oct. 27, 1864.	Excision of internal condyle...	Disch'd May 20, 1865. Complete anchylosis elbow joint; pens'd. Arm useless.
247	Wooster, U. T., Pt., G, 89th New York, age 22.	Aug. 21, 1864.	Gunshot wound of right elbow	Aug. 21. 1864.	Excision of olecranon process of ulna.	Disch'd Nov. 14, 1864; pensioned. Complete anchylosis of joint; hand of no use.
248	Wunderlen, F., Pt., G, 49th New York, age 29.	May 12, 1864.	Wound of right elbow joint by a conoidal ball.	May, 1864.	A portion of condyles of humerus and heads of ulna and radius, through straight incision over posterior part of joint.	Disch'd Jan. 3, 1865; pensioned. Anchylosis at right angle; rotation destroyed; atrophied; olecranon process drawn upward.
249	Yokes, W., Pt., C, 29th Ohio, age 32.	May 8, 1864.	Head and shaft of right ulna fractured by a conoidal ball.	May 8, 1864.	Three inches of radius, through two straight incisions, by Surgeon A. K. Fifield, 29th Ohio.	Amputation of arm May 10, 1864. Discharged September 1, 1864; pensioned.
250	Zeller, J., Sergeant, C, 100th Illinois, age 26.	Sept. 19, 1863.	External condyle of left humerus comminuted; internal condyle detached, with its condyloid ridge.	Sept. 19, 1863.	Joint laid open by transverse and longitudinal incisions and fragments of the internal condyle, with sharp point of the shaft, cut off by chain saw, by Surg. H. E. Huse, 24th Wis.	Union between condyle and humerus; arm useful. Disch'd Aug. 25, 1864; pensioned. Forearm swings freely on arm; has no power over it.

The foregoing two hundred and fifty operations were practised on forty-one Confederate and two hundred and nine Union soldiers, of whom one hundred and ninety-four were discharged and pensioned, twenty-one were returned to modified duty, and thirty-five were exchanged, paroled, or furloughed. One hundred and twenty-four operations were on the right, and one hundred and twenty-two on the left side, and four were without record on this point. In eighteen cases the injuries were inflicted by shell fragments or large projectiles; in the remainder, as far as known, by small missiles. A single straight longitudinal incision was the most common method of operating, and was employed in at least sixty-six cases. **H**-shaped, crucial, **T**-shaped, **S**-shaped, and **U**-shaped incisions were each adopted, in a half dozen or more cases. In a large proportion, the mode of operating was not detailed. The missile lodged and was removed in nine instances. Eighteen of the patients

had wounds of more or less severity in other regions. Eleven cases were complicated by consecutive hæmorrhage, necessitating ligation of the brachial in two cases, of the ulnar in one, and of smaller branches in two. In nine cases, the wounds became affected by erysipelas, and in ten by gangrene.[1]

Disease in the continuity of the resected bones sometimes followed; resulting not infrequently in small exfoliations, and occasionally in extended necrosis. Not a few of the twenty-seven consecutive amputations were practised on account of necrosis of the shaft of the humerus, and in several instances large sequestra were extracted at a late date. In the following instance the ulna became necrosed and was extirpated:

CASE 1787.—Private T. C. Beaumont, Co. M, 9th New York Cavalry, aged 20 years, was wounded at Shepherdstown, August 25, 1864, and was taken to a field hospital, where resection of the left elbow joint was performed by Surgeon R. Curran, 9th New York, through a linear dorsal incision, two inches of the lower extremity of the humerus and the olecranon and coronoid processes being excised thirteen hours after the reception of the injury. On the following day, the patient was sent to Baltimore and entered the Camden Street Hospital. Surgeon Z. E. Bliss, U. S. V., noted: "Ball entered the inner side of the left elbow and passed through the internal condyle. Excision of the elbow joint August 26th." On September 27th, this patient was transferred to hospital in Philadelphia, and thence to New York, where he was treated in Ladies' Home and McDougall hospitals, and was finally discharged June 19, 1865, and pensioned. Assistant Surgeon S. H. Orton, U. S. A., certified on his discharge papers: "Excision of the left elbow joint; arm useless." The pensioner was fitted with an apparatus by E. D. Hudson, M. D., of New York, who reported that a subsequent operation having become necessary, the entire ulna had been resected. Dr. Hudson also contributed the photograph represented by the wood-cut (FIG. 610), showing the result of the latter operation, and stated that "the functions of the hand are unimpaired, but there is no command of the forearm; the head of the radius is drawn up, the flexors of the forearm atrophied; there is slight pronation and supination, and the wrist joint is normal. On the application of an apparatus, two years after a second excision [to be mentioned presently], the extremity of the humerus afforded a good *point d'appui*, and the action of the appliance is encouraging. Although the muscles are debilitated through disuse, persevering practice will secure the man a good arm. This is the second case of exsection of the entire ulna practised in this country; the first was by Dr. Carnochan." Examiner E. Bradley, of New York City, July 25, 1866, reported: "Gunshot wound of left forearm, involving loss of the entire ulna by resection, with condyles of os brachii. The limb is atrophied, weak, and of no use to him. Operation was performed ten weeks ago [May 2, 1866], by Assistant Surgeon J. T. Calhoun, U. S. A., and the wound has fully healed; disability total and permanent." This pensioner was paid March 4, 1874.

FIG. 610.—Appearances of an excision at the left elbow for shot injury, followed by extirpation of the ulna for caries.

Summing up the results of these two hundred and fifty operations of primary excision at the elbow, we find that thirteen patients ultimately succumbed to causes more or less directly connected with the mutilation; that twenty-seven submitted to consecutive amputation; that one hundred, for the most part of the younger patients, recovered with false or true anchylosis, often retaining, however, very useful limbs, with complete preservation of the functions of the hand. Among the remaining hundred and ten, who recovered with active or passive motion at the joint, some examples are presented of wasted and painful limbs; but the majority had fairly useful arms, and, in a few instances, the usefulness of the member was but slightly impaired. As a rule, the total excisions resulted more favorably than the partial excisions,[2] furnishing comparatively fewer instances of consecutive complications, and, in short, a larger proportion of useful limbs.

[1] In addition to the illustrations of the results of primary excision of the elbow joint that have accompanied the detailed cases of this series, photographs of subjects who had undergone this operation were contributed to the Army Medical Museum in the cases of Anthony, 125th New York, CASE 4 (*Contrib. Surg. Phot.*, A. M. M., Vol. VII, p. 55); *Jones*, 53d Georgia, CASE 114 (*Ibid.*, Vol. II, p. 15); McGuire, 26th Massachusetts, CASE 138 (*Ib.*, Vol. XIII, p. 7); Summers, 42d Ohio, CASE 216 (*Ib.*, Vol. III, p. 30).

[2] It was mentioned on page 848 that in the 250 primary excisions resulting favorably, 61 were resections of the lower extremity of the humerus alone, 22 of the upper extremity of the radius only, and 37 of the upper extremity of the ulna. In the 130 remaining cases, the parts removed were unspecified in 56, the articular extremities of all the bones were resected in 34, the condyles and upper extremity of the ulna in 27, the condyles and head of radius in 2, and the upper extremities of the ulna and radius without resection of the humerus in 11.

§ *Fatal Cases of Primary Excision at the Elbow.*—Among the sixty-eight cases of excision at the elbow that terminated fatally, the extent of the parts removed was in nearly the same proportion as in the recoveries, so far as this point was specified.[1] The deaths resulted largely from exhaustion from protracted suppuration, surgical fever, or pyæmia.[2] The two following are abstracts of cases terminating fatally from pyæmia or tetanus:

CASE 1788.—Private C. E. Hyatt, Co. A, 14th Connecticut, was wounded at Morton's Ford, February 6, 1864, and admitted to the field hospital of the 3d division, Second Corps. Surgeon F. A. Dudley, 14th Connecticut, in charge, who operated in this case, reported: "Gunshot wound of left elbow joint by minié ball. Excision was performed on February 8th. Pyæmic symptoms set in on February 23d, and death ensued on February 28, 1864." It was impracticable to make an autopsy. The specimen, represented in the annexed cut (FIG. 611), consists of two inches of the lower extremity of the left humerus and two inches of the shaft and processes of the ulna. It was contributed by Surgeon J. Dwinelle, 106th Pennsylvania.

FIG. 611.—The lower extremity of the left humerus and portion of the ulna excised for shot injury. *Spec.* 2040.

CASE 1789.—Major B. S. Stanhope, 6th Ohio Cavalry, was wounded in the right elbow at Aldie Gap, June 17, 1863, and entered the field hospital of the 2d division, Cavalry Corps. Assistant Surgeon G. M. McGill, U. S. A., who performed excision, furnished the following account of the case: "He was wounded in the right upper extremity by a carbine ball. Entrance two inches above the tip of the olecranon in semiflexion; course inward, downward, and forward, breaking the humerus—without extensive shock of the bone or comminution—passing down anteriorly, partially denuding the radius; exit in the anterior inferior third of the forearm. Primary resection was performed six hours after the injury. Patient is about 26 years, short, and has an abundance of adipose tissue." The specimen, represented in the annexed cut (FIG. 612), consists of three inches of the lower extremity of the right humerus, which was nearly transversely fractured, with some comminution, two inches above the articulation. It was contributed by the operator. On the day following the injury the patient reached Prince Street Hospital, at Alexandria, whence Surgeon J. R. Spencer, U. S. V., reported the following result: "This patient had been transported sixteen miles in an ambulance wagon and the same distance by cars, after the operation, before entering this hospital. The weather was warm and damp. The musculo-spiral and ulnar nerves were injured. Tetanus in the form of acute opisthotonos set in on June 23d. The treatment consisted of stimulants, tonics, and narcotics. Death occurred on June 25, 1863."

FIG. 612.—Three inches of the lower extremity of the right humerus excised for shot injury. *Spec.* 1282.

Sixteen of the patients died after submitting to consecutive amputation.

CASE 1790.—Private J. Kennelly, Co. F, 170th New York, aged 32 years, was wounded at Deep Bottom, August 15, 1864. He was admitted to the field hospital of the 2d division, Second Corps, where Surgeon J. F. Dyer, 19th Massachusetts, noted: "Fracture of elbow joint. Resection of head of ulna by Surgeon F. Douglass, 170th New York." On August 20th, the patient entered Satterlee Hospital, whence Acting Assistant Surgeon A. A. Smith contributed the specimen (FIG. 613) with the following report: "The patient was admitted from a field hospital at City Point with a gunshot fracture of the upper third of the right ulna, a minié ball entering one inch below the elbow joint, embedding itself between the radius and ulna, fracturing the ulna, and destroying the articulating surface of the radius. The ball was removed by an incision posteriorly, and about two inches of the ulna was resected on the field. When admitted, the whole arm and forearm was œdematous and the wound quite unhealthy, with the radius protruding some two inches through the incision. Etherized the patient and replaced the radius, then applied an anterior angular splint, afterward dressing the wound with cold water. Tonics and stimulants, with a nutritious diet, were administered, under which treatment he improved slightly, his general health being much impaired previously. September 9th, at 9 A. M. had a hæmorrhage, supposed to be from the radial and interosseous arteries, losing some five or six ounces of blood. A consultation was held, and it was decided to amputate the arm at the middle of the lower third, which was done by Acting Assistant Surgeon A. A. Smith by the circular operation. September 15th, removed two of the ligatures. September 17th, removed the others. Up to this time there has been very little change in his condition. September 19th, had a hæmorrhage from the stump, losing some four ounces of blood, which was arrested by compression. September 20th and 21st, had a severe chill. September 22d, slight chill, all of which was followed by slight fever and profuse cold clammy perspiration. Is slightly delirious, and complains of pain on pressure in the right hypochondriac region. In addition to tonics and stimulants, gave him bisulphate of soda, ten grains every two hours, in an infusion of quassia. From the first chill on September 20th he rapidly sank, and died at 7 A. M. on September 24th, 1864." The specimen consists of the bones of the right elbow after excision of the upper portion of the ulna. A partially detached sequestrum exists in the upper extremity of the ulna, around which is a very slight involucrum. Some spongy bone has been thrown out at the radial tuberosity. The articular surface of the radius is eroded, and the extremity of the humerus is carious.

FIG. 613.—The bones of the right elbow after excision of the upper three inches of the ulna. *Spec.* 3651.

[1] They may be classified according to the parts excised as follows: Removal of ends of all the bones, 4; excision of condyles of the humerus and upper part of ulna, 7; condyles of humerus, with or without a part of its shaft, 14; olecranon only, 5; olecranon, with upper part of ulna, 10; head of radius and upper part of ulna, 1; parts not specified, 27.

[2] The causes of death are returned as variola, 1; tetanus, 1; erysipelas and gangrene, 6; secondary hæmorrhage, 9; exhaustion, 10; pyæmia, 22; pneumonia, 4; chronic diarrhœa, 2; gastritis, 1; typhoid and intermittent fevers, 2; general paralysis, 1; unknown, 9. The soldier who succumbed to general paralysis had nearly recovered with an anchylosed joint; he went in bathing, when he had a seizure that eventuated in progressive ataxia.

In some of the cases returned as resections at the elbow, as in the two following, the operations consisted in little more than the removal of detached fragments of bone. Such cases impressively illustrate the disadvantages of partial excisions, with limited division of the articular capsule, whereby, as Professor Esmarch observes,[1] that feature of the operation which deprives the wound of its danger, the extensive severing of the ligamentous apparatus of the joint, is omitted:

CASE 1791.—Private J. Allen, Co. G, 9th New York Cavalry, was wounded in an engagement at the Rapidan River, September 14, 1863. Surgeon W. H. Rulison, 9th New York Cavalry, recorded his admission at the field hospital of the 1st division, Cavalry Corps, with: "Gunshot fracture of left arm." On the following day the wounded man entered Armory Square Hospital at Washington, where Surgeon D. W. Bliss, U. S. V., in charge, performed excision at the elbow joint. The details of the case he reported as follows: "The patient was wounded by a pistol bullet entering immediately over the external condyle of the left humerus, fracturing the condyle, passing downward, and opening the elbow joint. He was admitted to the hospital on September 15th, and a portion of the condyle removed by the chain saw, and several loose fragments taken out, the incision through the muscles being of an **S**-shape; patient under ether. The ball remains in the arm. After the operation cold water was applied continuously, and opiates given when necessary to relieve pain. The whole arm became greatly swollen the ensuing day, yet not very painful; tongue moist; pulse full and regular; appetite tolerably good; wound secreting healthy pus. He was, however, unable to void his urine, which was drawn off by the catheter—an operation which had to be frequently repeated during his illness. On the 18th, cold water as an application to the arm was omitted as it appeared to increase the pain, and warm-water dressing was substituted. The latter was also discontinued for a like reason, and from that time onward the limb was kept wet with a lotion composed of acetate of lead one drachm, pulverized opium half a drachm, and water one pint, and the wound itself with a solution of permanganate of potassa one-half drachm in one pint of water. From the 16th his symptoms became more unfavorable, having daily two and sometimes three rigors, followed by increased heat of body and profuse sweats. On the 26th, wound secreting a greenish and very offensive pus; pulse frequent and sometimes intermittent; skin dry; conjunctiva yellow; tongue dry with brown fur in centre; no appetite; urine of dark amber color; bowels constipated. The bowels were opened by podophyllum half a grain, and extract of colocynth eight grains. Sulphate of quinine was given daily, as it had been from the commencement of the rigors, and opium also to relieve pain; sweet spirit of nitre and spirit of mindererus in proper doses when the skin was hot and dry. Milk punch and beef essence were freely administered, and every proper article of diet which he imagined he could eat, such as chicken, chicken broth, &c., was procured and given to him. Free incisions were made from time to time to evacuate pus, which unavoidably found its way beneath the muscles of the arm. On the 30th hæmorrhage occurred, which was, however, readily controlled by pressure. He continued to sink hourly, and died at 10½ o'clock A. M., October 1, 1863." The specimen, represented in the annexed cut (FIG. 614), consists of six fragments, embracing the outer condyle and the adjoining portion of the left humerus. It was contributed by the operator.

FIG. 614.—Fragments of the outer condyle and portion of the left humerus removed for shot injury. *Spec.* 1729.

CASE 1792.—Sergeant B. McBride, Co. H, 88th New York, aged 25 years, was wounded at the Wilderness, May 5, 1864, and admitted to the field hospital of the 1st division, Second Corps. Surgeon J. E. Pomfret, 7th New York Artillery, recorded: "Wound of right elbow joint; fracture of bones. Resection by Surgeon P. E. Hubon, 28th Massachusetts." Assistant Surgeon W. Thomson, U. S. A., contributed the specimen (FIG. 615), and reported the result of the case as follows: "The patient was admitted to Douglas Hospital, Washington, on May 11th, with comminuted fracture of the elbow joint, produced by a conoidal ball. He died on June 13, 1864, of pyæmia, having had chills, profuse perspiration, and icterus for several days previous. At the autopsy fourteen ounces of dirty-yellow serum was removed from the pleural cavities, and numerous pyæmic patches were found in the posterior portion of both lungs. The liver and spleen were both softened, but contained no yellow patches." The specimen consists of the bones of the right elbow, from which the outer condyle and the head of the radius are missing. The articular surfaces are carious. (*Cat. Surg. Sect.*, 1866, p. 150.) Evidences of periosteal inflammation with thin osteophytic depositions extend along the parts of each of the bones contiguous to the fracture. The operation must have been limited to the extraction of the fragments of the outer condyle and of the head of the radius.

FIG. 615.—Shot perforation of the right elbow. *Spec.* 3556. ⅛

Five of the patients had wounds in other regions, but of little gravity, except in one case, in which the patient was subjected to a partial amputation of the foot by Chopart's method. Twenty-six of the operations were on the right and thirty-five on the left side; in seven cases this point was not reported. Nine of the patients were Confederate, and fifty-nine Union soldiers. The method of Langenbeck was most frequently adopted. Next in frequency were the methods by **H**-shaped and curvilinear incisions.

[1] ESMARCH (E.) (*Über Resectionen nach Schusswunden*, Kiel, 1851, S. 78) remarks that "man sich auch nicht damit begnügen soll, in Fällen, wo die Knochen nur in geringer Ausdehnung verletzt sind, eine *partielle* resection der getroffenen Knochentheile vorzunehmen, ohne die Gelenkkapsel in ihrer ganzen Ausdehnung zu durchschneiden, denn gerade diese ausgiebige Zerschneidung des ligamentösen Gelenk-apparates halte ich bei Resectionen für dasjenige Moment, welches der Verwundung ihre Gefährlichkeit benimmt; je weniger man aber von den Gelenk-enden der Knochen entfernt, desto grösser is die Wahrscheinlichkeit der Ankylosirung."

TABLE CVIII.

Summary of Sixty-eight Fatal Cases after Primary Excision of Elbow Joint for Shot Injury.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Abbott, G., Pt., G, 45th Ohio, age 21.	July 21, 1864.	Shot fracture of internal condyle of left humerus.	July 21, 1864.	Excision of internal condyle...	Hæmorrhage; arm amputated; pyæmia. Died Nov. 7, 1864.
2	Abe, H., Pt., A, 91st Indiana.	July 1, 1864.	Fracture of right elbow joint by conoidal ball.	July 1, 1864.	Excision, by Surg. J. W. Lawton, U. S. V.	Died July 27, 1864.
3	Allen, J., Pt., G, 9th New York Cavalry, age 28.	Sept. 14, 1863.	Pistol ball fractured the external condyle of left humerus and opened joint.	Sept. 15, 1863.	Portion external condyle thro' S incision, spiculæ removed, by Surg. D. W. Bliss, U.S.V.	Hæmorrhage. Died October 1, 1863, of pyæmia. *Spec.* 1729.
4	Austin, C., Pt., B, 42d Pennsylvania, age 23.	May 7, 1864.	Wound through left elbow; articular ends of the bones composing joint comminuted by conoidal ball.	May 7, 1864.	One inch of articular end of ulna excised and ball extracted, by Surgeon C. Bower, 6th Pennsylvania Reserves.	July 1st, anchylosis; erysipelas; abscesses. Arm amp. July 12th. Died July 28, 1864, from exhaustion. *Spec.* 2836.
5	Bair, S., Sergeant, I, 7th Indiana.	May 23, 1864.	Fracture of right elbow joint..	May 23, 1864.	Humerus and ulna, by Surg. C. Chamberlain, U. S. V.	Died June 26, 1864, of pyæmia.
6	Blackwell, P., Corp'l, G, 7th New York Heavy Art.	June 16, 1864.	Shot fracture of arm.....	June 16, 1864.	Excision elbow joint, by Surg. P. E. Hubon, 25th Mass.	Died June 23, 1864.
7	Boles, J., Pt., H, 107th Illinois.	May 27, 1864.	Compound comminuted fracture of middle third of right ulna by conoidal ball.	May 28, 1864.	Excision of seven inches disarticulating ulna at elbow joint, by Surg. E. Shippen, U.S.V.	Died June 19, 1864.
8	Bugby, N., Corp'l, A, 65th Illinois.	June 15, 1864.	Fracture of left olecranon and external condyle of humerus.	June 15, 1864.	Excision of olecranon and external condyle.	Died June 24, 1864.
9	Carr, F. W., Sergeant, C, 16th N. Y. H. A., age 28.	Oct. 7, 1864.	Fracture of right arm by conoidal ball.	Oct. 7, 1864.	Excision of right elbow joint..	Died October 30, 1864, from exhaustion.
10	Cusic, N. B., Pt., F, 29th Pennsylvania, age 24.	May 25, 1864.	Head of left ulna comminuted by conoidal ball.	May 25, 1864.	Three inches of ulna excised..	Arm amputated. Died August 4, 1864, from exhaustion.
11	Darrow, H. C., Pt., G, 77th New York, age 24.	May 18, 1864.	Left elbow joint laid open by ball; also wound of foot; amp. at middle tarsal articulation.	May 18, 1864.	Elbow joint, through incision four inches long over olecranon process of ulna.	Gangrene; hæmorrhage on June 13th; humerus necrosed. Died June 23, 1864, from gangrene.
12	Dickson, B. F., Sergeant, B, 7th Louisiana, age 26.	July 2, 1863.	Wound of left elbow by conoidal ball.	July 3, 1863.	Removal of two inches of lower end of humerus.	Sloughing Aug. 12th; intermittent fever; constant vomiting. Died October 6, 1863.
13	Dornmoyer, L., Pt., E, 17th Penn. Cav., age 35.	May 31, 1864.	Shot fracture of condyles of left humerus.	May 31, 1864.	Excision of condyles of humerus.	Pyæmia. Died July 2, 1864.
14	Edwards, T. J., Pt., H, 57th Indiana, age 25.	May 28, 1864.	Shot fracture of forearm.....	May 28, 1864.	Excision of head of ulna, by Surg. E. B. Glick, 40th Ind.	Died June 22, 1864.
15	Elliott, J., Pt., B, 164th New York.	June 2, 1864.	Shot wound of arm; also wound of left side.	June 2, 1864.	Excision of elbow joint, by Surg. M. Rizer, 72d Pa.	Died June 12, 1864.
16	Ellinberger, A. C., Pt., B, 59th New York.	July 2, 1863.	Fracture of left elbow joint...	July 2, 1863.	Excision of joint.....	Died July 30, 1863.
17	*Fand, W. H.*, Pt., C, 7th Virginia Cavalry, age 37.	June 14, 1864.	Comminuted fracture of olecranon process by conoidal ball.	June 14, 1864.	Olecranon process, through vertical incision over joint.	Died July 4, 1864, of erysipelas.
18	Fitzgerald, W., Pt., B, 1st U. S. Sharpshooters, age 19.	Nov. 7, 1863.	Shot fracture of the right humerus near elbow joint; arm erysipelatous.	Nov. 7, 1863.	Two inches of humerus, by Surg. H. F. Lyster, 5th Mich.	Erysipelatous; hæmorrh'e Nov. 12. Died November 29, 1863, of pyæmia.
19	Fulton, G. E., Pt., C, 4th Vermont, age 26.	July 7, 1864.	Wound of left elbow joint....	July 7, 1864.	Excision of portion of olecranon process.	Amputation of upper third; July 8, hæmorrhage; ligation. Died Feb. 6, 1865, of chron. diarrhœa.
20	Green, W. N., Lieut.-Col., 173d New York.	April 8, 1864.	Wound of left elbow.....	April 8, 1864.	Excision of head of ulna.....	Arm amputated May 6th. Died May 14, 1864, of gastritis.
21	Grove, W. C., Pt., E, 11th Pennsylvania, age 22.	June 23, 1864.	Fracture of right elbow by conoidal ball.	June 23, 1864.	External condyle of humerus excised.	Died July 26, 1864.
22	Gutherlet, F., Pt., K, 27th Massachusetts, age 26.	June 3, 1864.	Wound of right elbow joint by conoidal ball.	June 3, 1864.	Excision of joint.....	Hæmorrhage; arm amp. Died July 6, '64; pyæmia. *Spec.* 2915.
23	*Haltiwanger, G. I.*, Pt., C, 20th South Carolina, age 21.	Oct. 19, 1864.	Comminution of elbow joint..	Oct. 19, 1864.	Excision.....	Died December 1, 1864.
24	Hodsden, D. C., Capt., H, 9th Indiana, age 24.	June 24, 1864.	Fracture of left radius, penetrating elbow joint.	June 24, 1864.	Excision.....	Gangrene; erysipelas; amputated. Died July 27, 1864, of pyæmia.
25	Hough, M., Pt., D, 14th U. S. Infantry, age 18.	June 1, 1864.	Fracture of lower third of left humerus by conoidal ball.	June 2, 1864.	Excision of elbow joint through incision six inches long.	Anchylosis of elbow; gangrene. Died September 11, 1864, of general paralysis.
26	Hughes, H., Pt., E, 21st Kentucky, age 24.	June 22, 1864.	Fracture of right elbow joint..	June 22, 1864.	Excision of joint, by Surg. J. D. Brumley, U. S. V.	Arm amputated at middle third. Died July 6, 1864, of pyæmia.
27	Hyatt, C. E., Pt., A, 14th Connecticut.	Feb. 6, 1864.	Condyles of left humerus and superior articulating extremity of ulna comminuted by conoidal ball.	Feb. 8, 1864.	Two inches of lower extremity of humerus and two inches of upper end of ulna, by Surg. F. A. Dudley, 14th Conn.	Died February 28, 1864, of pyæmia. *Spec.* 2040.
28	Ingolsby, J., Pt., G, 23d Illinois.	Sept. 20, 1861.	Wound of left elbow joint....	Sept. 20, 1861.	Resection of joint.....	Erysipelas; Nov. 1, amp. of arm. Disch'd Feb. 20, 1863. Wound never healed. Died Aug 7, 1863.
29	Jacobs, W. H., Pt., E, 8th New York Heavy Art.	June 3, 1864.	Fracture of right elbow joint, destroying olecranon, by conoidal ball.	June 3, 1864.	Excision of portion of ulna, by Surg. D. W. Maull, 1st Delaware.	Hæmorrhage from brachial artery. Died June 23, 1864.
30	Kenedy, W. J., Pt., G, 55th Illinois, age 33.	May 22, 1863.	Wound of left arm	May 22, 1863.	Excision of elbow joint, removing one and a half inches end of ulna.	Pyæmia. Died June 23, 1863, of typhoid fever.
31	Kennelly, J., Pt., K, 170th New York, age 32.	Aug. 15, 1864.	Fracture of upper third of right ulna, articular surface of radius destroyed, by conoidal ball.	Aug. 15, 1864.	Upper three inches of ulna, by Surg. F. Douglas, 170th N. York.	Caries of end of humerus; hæm. Arm amputated September 4th; hæmorrhage. Died September 24, 1864, of pyæmia. *Spec.* 3651.
32	Kessler, J. E., Pt., K, 20th Ohio.	July 22, 1864.	Fracture of right elbow joint..	July 22, 1864.	Excision.....	Died September 13, 1864.
33	Krats, A., Pt., B, 73d Pennsylvania.	May 15, 1864.	Fracture of left elbow joint...	May 15, 1864.	Excision, by Surg. J. L. Dunn, 109th Pennsylvania.	Died June 21, 1864.
34	*Lang, W.*, Pt., H, 61st Ga., age 33.	May 8, 1864.	Wound of left elbow joint....	May 8, 1864.	Excision, through straight incision.	Pleurisy. Died May 16, 1864, symptoms of pyæmia.
35	Lee, T., Pt., C, 6th Cavalry.	J'e 9,'63.	Fracture of right elbow.....	J'e 9,'63.	Excision.....	Died June 23, 1863.
36	Lewis, J., Corp'l, B, 136th New York.	June 23, 1864.	Fracture of left elbow joint ..	June 23, 1864.	Internal condyle of humerus, by Surg. B. L. Hovey, 136th N.Y.	Died July 10, 1864, of pyæmia.
37	Littleton, A. C., Pt., A, 20th South Carolina.	Oct. 19, 1864.	Shot wound of elbow joint, splitting off internal condyle of humerus.	Oct. 21, 1864.	Heads of radius and ulna and three inches of humerus, by Dr. J. M. G. McGuire, C. S. A.	Died Nov. 17, 1864, of double pneumonia.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
38	McBride, B., Pt., A, 88th New York, age 25.	May 5, 1864.	Outer condyle and head of radius, right elbow, fractured by ball.	May 5, 1864.	Portion of outer condyle of humerus and head of radius, by Surg. P. E. Hubon, 28th Mass.	Pyæmia. Died June 13, 1864. *Spec.* 3556.
39	McLaughlin, B., Pt., 20th Massachusetts.	May 30, 1864.	Wound of right elbow joint, fracture of olecranon process of ulna, by conoidal ball.	May 30, 1864.	Excision of pieces of bone, by Surg. N. Hayward, 20th Massachusetts.	Gangrene; joint opened. Arm amputated June 16th. Died June 23, 1864, of pyæmia.
40	Meyer, G., Pt., A, 32d Indiana.	June 25, 1863.	Fracture of left elbow joint; minié ball split the humerus and fractured olecranon.	June 28, 1863.	Excision of fifteen fragments, representing extremities of all bones forming elbow joint.	Pain intense. Died July 7, 1863. *Spec.* 1751.
41	Miller, G., Pt., F, 31st Colored Troops, age 35.	Aug. 1, 1864.	Fracture of left elbow.....	Aug. 1, 1864.	Resection of elbow.....	Died August 7, 1864.
42	*Noel, J.*, Pt., B, 19th Virginia, age 35.	June 3, 1864.	Fracture of the left humerus through condyles.	June 3, 1864.	Excision of condyles and two inches of shaft.	Died July 8, 1864, from exhaustion.
43	Parey, H. C., Pt., B, 3d Indiana Cavalry.	July 1, 1863.	Fracture of left elbow joint....	July 1, 1863.	Excision of both condyles of humerus.	Died July 22, 1863, of pneumonia.
44	Phillips, H., Pt., A, 14th Connecticut, age 36.	Aug. 13, 1864.	Shot fracture of lower portion of right humerus and olecranon process of ulna.	Aug 14, 1864.	Condyles of humerus excised, by Surg. G. Chaddock, 7th Michigan.	Arm amputated Sept. 10. Died Oct. 24, 1864, from exhaustion and debility. *Spec.* 3248.
45	Potts, M., Captain, D, 8th Missouri.	Jan. 11, 1863.	Wound of left elbow.....	Jan. 11, 1863.	Excision of elbow.....	Died Feb. 24, 1863, of variola.
46	Prettyman, C., Corp'l, E, 1st Delaware, age 20.	May 7, 1864.	Shot wound of left elbow, ulna and radius fractured.	May 7, 1864.	Excision of radius and ulna, by Surg. D. W. Maull, 1st Delaware.	Condyles of humerus removed May 24. Died June 11, 1864, of pneumonia.
47	Query, J. R., Pt., E, 2d Pennsylvania.	July 2, 1863.	Wound of left arm and leg....	July, 1863.	Partial excision of elbow joint, removing portion of ulna.	Died July 4, 1863.
48	Reed, T. A., Serg't, D, 51st Ohio, age 32.	Dec. 16, 1864.	Fracture of ulna, involving joint, by conoidal ball.	Dec. 16, 1864.	Excision of left elbow joint....	Amputation of left arm at middle third. Died January 15, 1865, of pyæmia.
49	Reidel, P., Pt., A, 2d Missouri, age 30.	Nov. 25, 1863.	Shell fracture of external condyle of left humerus.	Nov. 27, 1863.	One and a half inches end of humerus and both condyles.	Died December 20, 1863.
50	Rautenbush, F., Pt., E, 55th Pennsylvania, age 20.	June 3, 1864.	Fracture of right elbow by conoidal ball.	June, 1864.	Excision of elbow.....	Died June 16, 1864, from exhaustion.
51	Slover, W. L., Pt., D, 4th New York, age 21.	May 19, 1864.	Wound of right arm.....	May 21, 1864.	Excision of elbow joint	Pyæmia. Died June 13, 1864.
52	Smith, A., Pt., F, 21st Wisconsin.	May 27, 1864.	Shot fracture of left elbow joint	May 27, 1864.	Excision.....	Died June 6, 1864.
53	Springer, W., Pt., B, 90th Ohio, age 21.	June 21, 1864.	Fracture of right ulna at elbow joint.	June 21, 1864.	Excision, by Surg. J. D. Brumley, U. S. V.	Died July 9, 1864, from exhaustion.
54	Stanhope, B. C., Major, 6th Ohio Cavalry, age 26.	June 17, 1863.	Carbine ball fractured right humerus, denuded radius, joint opened, musculo-spiral and ulna nerves injured.	June 17, 1863.	Three inches of end of humerus and olecranon process of ulna through an H incision, by Surg. G. A. McGill, U. S. A.	Died June 25, 1863, from tetanus. *Spec.* 1282.
55	Steel, J., Pt., B, 164th New York.	June 3, 1864.	Fracture of right elbow by conoidal ball.	June 3, 1864.	Excision of end of humerus, by Surg. M. Rizer, 72d Penn.	Died June 20, 1864, of pyæmia.
56	Sullivan, D. J., Pt., C, 58th Massachusetts, age 26.	April 2, 1865.	Fracture of left elbow joint by conoidal ball.	April 2, 1865.	Lower part of humerus, by Surg. L. W. Bliss, 51st N. Y.	Died May 5, 1865, of pyæmia.
57	*Sykes, J. J.*, Pt., A, 2d Arkansas.	May 14, 1864.	Compound fracture of left ulna by conoidal ball.	May 14, 1864.	Olecranon process, by Surg. G. L. Carhort, 31st Iowa.	Died June 13, 1864.
58	Sculler, F. M., Corp'l, G, 6th Missouri.	Dec. 29, 1862.	Compound fracture of left elbow, and wound of neck.	Dec. 29, 1862.	Excision of left elbow joint, by Surg. G. S. Walker, 6th Mo.	Died February 21, 1863, from exhaustion.
59	Sharp, W. J., Corp'l, H, 73d New York.	May 5, 1862.	Wound of elbow joint.....	May 5, 1862.	Excision of joint.....	Died May 26, 1862, of pyæmia.
60	Shleep, J., Pt., B, 51st Ohio, age 32.	June 20, 1864.	Shot wound of right elbow joint.	June 20, 1864.	Excision of extremity of ulna and end of humerus, by Surg. J. T. Woods, 99th Ohio.	Died July 19, 1864, of pyæmia.
61	*Simpson, W. D.*, Pt., E, 52d Virginia, age 23.	May 30, 1864.	Comminuted fracture of olecranon process of left ulna.	May 30, 1864.	Excision of portion of ulna by a vertical incision.	Died July 4, 1864, of erysipelas.
62	Taylor, E., Pt., I, 7th Rhode Island, age 19.	April 2, 1865.	Fracture of left elbow joint by conoidal ball.	April 2, 1865.	Excision of left elbow joint, by Surg. L. W. Bliss, 51st N. Y.	Died April 16, 1865, of phlegmonous erysipelas.
63	Tucker, W. A., Pt., K, 56th Illinois.	Nov. 25, 1863.	Shot fracture of left elbow joint.	Nov. 25, 1863.	Excision of right elbow joint..	Died December 27, 1863.
64	*Whitehead, O.*, Pt., D, 66th North Carolina, age 34.	June 17, 1864.	Fracture of condyles of left humerus and portion of ulna.	June 18, 1864.	Three inches of extremity of humerus and olecranon.	Gangrene. Died July 20, 1864.
65	Williams, H., Pt., B, 36th Wisconsin, age 29.	June 1, 1864.	Wound of right elbow joint by conoidal ball.	June 1, 1864.	Condyles of humerus, also coronoid process of ulna.	Died October 6, 1864, from chronic diarrhœa.
66	Winship, D., Pt., F, 9th New Hampshire, age 19.	Sept. 17, 1862.	Shell fracture of right elbow joint.	Sept. 18, 1862.	Excision, by Surg. M. Storrs, 8th Connecticut.	Arm amputated. Died November 12, 1862.
67	Wing, F. D., Pt., F, 121st New York, age 31.	May 10, 1864.	Fracture of right elbow joint by conoidal ball.	May 11, 1864.	Two inches of upper end of ulna.	Arm amputated June 3d. Died June 30, 1864, of pyæmia.
68	Wood, C. C., Pt., B, 2d Ohio Heavy Artillery.	Dec. 15, 1863.	Condyles of right humerus broken off by conoidal ball; spiculæ removed.	Dec 16, 1863.	Excision of lower end of humerus and removal of condyles, by Surg. H. G. Keefer	Died January 14, 1864, of pyæmia.

Table CIX.

Summary of Four Cases of Primary Excisions of the Bones of the Elbow Joint with Undetermined Result.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Remarks.
1	*Honeycut, W. M.*, Pt., H, 10th Georgia, age 24.	Nov. 29, 1863.	Wound of right elbow joint ..	Nov. 29, 1863.	Excision of elbow joint	.....
2	*Lowe, A. B.*, Pt., A, 31st Georgia.	Mar. 25, 1865.	Fracture of right elbow joint by conoidal ball.	Mar. 25, 1865.	Excision of olecranon process..	.....

2. Intermediary Excisions at the Elbow.—The hundred and ninety-seven reported cases of this group (the result having been determined in every instance but one) presented a mortality rate of 35.2, or nearly fourteen per cent. greater than in the series of primary excisions, and nearly two per cent. greater than in the series of *intermediary amputations* in the continuity of the arm. Somewhat more than a fourth of the operations were complete excisions,—in the strict sense the articular ends of the humerus, radius, and ulna having been resected. These fared better than the cases of partial excision.[1] The limb interested is unspecified in eight cases; in ninety-one instances excision was at the right, and in ninety-eight at the left elbow, with less favorable results in the operations on the left side. In nineteen cases, recourse was ultimately had to amputation, with eight deaths.

§ *Recoveries after Intermediary Excisions at the Elbow.*—The survivors of this operation were four Confederate and one hundred and twenty three Union soldiers. Apart from three cases in which the point is not specified, the excisions were practised in equal number on the two limbs, sixty-two on each. Thirteen patients returned to modified duty, three were exchanged or furloughed, three recovered whose final disposition is unrecorded, and one hundred and eight were discharged and pensioned. Eight of the pensioners have died since their discharge, three from causes unconnected with their injury. Three of the survivors had received serious wounds in other regions. In all but four cases the injuries were believed to have been inflicted by musket or carbine balls. Complications will be noticed in connection with some of the detailed abstracts of cases, or in the summary in TABLE CX.

CASE 1793.—Private F. A. Warner, Co. C, 7th Ohio, aged 26 years, was wounded at Winchester, March 23, 1862. Surgeon W. A. King, U. S. A., Medical Director, reported, on the casualty list: "Compound fracture of elbow." Assistant Surgeon R. F. Weir, U. S. A., in charge of Frederick Hospital No. 1, contributed the following minutes of the case: "The man was shot in the left elbow while in the act of loading his gun. He was carried to the hospital at Winchester, and thence sent to Frederick on April 5th. He stated that considerable swelling and pain had ensued, but had diminished within a week previous to his entrance here, a free discharge of matter taking place from the wound. On examination the ball (spherical) was found to have entered just over and to the outside of the articulation of the radius with the humerus, and to have made its exit above and external to the inner condyle. The wound of entrance had enlarged to the size of a half dollar from sloughing, which, however, had ceased. The parts about the joint were much swollen, painful, and tender on pressure, which caused escape of pus mingled with synovial fluid. The wound was examined digitally by Dr. Dunott, who reported communication with the articulation. But moderate constitutional disturbance was present. Patient is a man of robust constitution, though of somewhat irritable temperament. April 6th, I saw him this morning for the first time, and as the previous introduction of the finger by the attending surgeon had caused much pain and increased the swelling of the parts, contented myself with an examination by the probe, revealing quite extensive fracture of the radius and humerus. Exit of matter was quite free through the anterior opening. Advised resection, but the patient refused his consent to the operation. In view of his otherwise good condition ordered the arm to be placed in a guttered tin splint at an angle of about 110°, and water poultice to be applied to the joint. April 15th, since last date patient has fallen off rapidly, especially within the past two or three days, though suffering but moderate pain. The joint has become more swollen, and burrowing of matter on the posterior aspect of the arm has supervened. The discharge from the anterior opening has deteriorated in quality, becoming more sanious. He has also had some slight diarrhœa with tendency to dryness of tongue; hectic at night; pulse 118 and irritable. He was more strongly urged to submit to the operation, to which, by the advice of his brother and family physician, he finally consented. April 16th, the diarrhœa was readily checked by opiates and careful regulation of diet with judicious administrations of stimulants, and this morning his general condition has much improved; pulse 108 and less irritable and fuller; has fever. An abscess one and a half inches above the original wound of entrance opened spontaneously this morning above the olecranon. At 11 o'clock A. M., the patient being etherized, in presence of Drs. Pinkney, Chittenden, Heany, Goldsborough, and Dunott, the Hospital Staff, I proceeded to excise the joint by a longitudinal incision six inches long through the opening of the abscess, having the inner margin of the olecranon process for its centre. The ulnar nerve was carefully dissected from the internal condyle and turned back, and confided to an assistant. The posterior internal and exterior lateral ligaments were successively divided and the joint forced open by extensive flexure of the limb. It was then seen that the ball had struck the anterior margin of the head of the radius, clipping off a small portion, and traversed the middle of the external portion of the extremity of the humerus, splitting off the external condyle and articulating surface corresponding to the head of the radius. The ends of the bone were separated anteriorly and laterally by the knife

[1] The parts removed were specified in 179 of the 197 cases of intermediary excisions. The articular extremities of all the bones of the elbow were excised in 46; the ends of the humerus and ulna in 29; the ends of the humerus and radius in 7; the condyles in 33; the upper extremities of the ulna and radius in 17; of the ulna, alone, in 39; of the radius in 8; in 18 cases the parts removed were not specified.

kept constantly close to the bony parts, and then protruded through the incision and sawn off by an ordinary short amputating saw; the radius and ulna being removed on a line a little below the articulating surface of the radius, and the humerus just above the condyles, only such an amount being taken away as was sufficient to comprise the fractured parts. The unfractured portion of the joint was found with the cartilage softened and eroded, and spongy granulations springing from its surface. The abscess extended to a little below the middle of the arm. But little hæmorrhage was present, and only two small arteries required ligation. Some difficulty was experienced in dividing the internal ligaments, and after the restricted portion had been divided by a blunt-pointed bistoury, which, by slipping, cut my left index finger used as a guide, it was thought by some of the assistants that the nerve had been severed. Whether the bundle divided was the nerve was not then ascertained. The upper and lower thirds of the wound were closed by silver interrupted sutures, the middle portion, involving the opening of the abscess, being left open for drainage. The arm was then placed on a well-padded splint, covered with oiled silk, at an angle of 140°, and cold-water dressings were applied. The patient suffered but slightly from the operation, and within two hours reaction was firmly established. Twenty minims of Magendie's solution of sulphate of morphia was given to allay pain. April 17th, patient passed a quiet night; pulse 120, quick, and somewhat weak; skin a little dry and warm. Ordered brandy half an ounce every four hours, and a prescription of spirit of mindererus three ounces and a half, sweet spirit of nitre half an ounce, and tincture opii two drachms, given in half-ounce doses every three hours. The arm is much swollen. The place left open for drainage has become closed from tumefaction, and the gaping edges are bathed in purulent lymph. The secretion finds ready exit through the original wound over the external condyle, which presents, however, a sloughy appearance consequent upon the contusion unavoidable during the operation. Tension on the sutures is present. In the afternoon one suture was removed, and adhesions to the extent of one and a half inches broken up by a probe, giving free exit to matter. Having obtained ice with some difficulty, it was placed in a bladder and applied to the elbow. The patient's appetite is fair and he takes a good allowance of beef tea. He complains of numbness in little and ring fingers, having had, he states, sensation in them prior to the operation. The unavoidable inference is that the nerve was injured. April 18th, passed a very comfortable night, and this morning the pulse is 100 and fuller; skin moist and appetite very good. Takes solid food and one bottle of ale daily. The ice application has been very grateful to him, and the swelling has perceptibly subsided. The discharge is assuming a more natural appearance and is less bloody. Treatment continued. April 20th, continues to improve. His general condition is very good; pulse 92 and of good force. The swelling of the limb is rapidly diminishing, the discharge is becoming more laudable, and the gaping edges of the wound are commencing to clean off and granulations to appear. Takes good diet and one bottle of ale per diem. Continued the ice applications. April 28th, the swelling has entirely subsided. The surface of the wound cleaned off, also the original wound, and they are now covered with healthy granulations. The discharge is moderate and laudable; no burrowing. Has continued the local applications of ice to the present time. Ordered arm to be dressed with balsam of Peru. General condition much improved; appetite good; pulse 80. Takes good diet, and a prescription of sulphate of quinine one grain, sulphate of iron two grains, and extract of gentian sufficient quantity. May 1st, the splints having become displaced by the movements of the body, and the patient having complained of pain over site of external condyle, the arm for the first time since the operation was carefully and clearly lifted from the splint, examined, cleaned, and replaced on a new and broader splint, bent at a more acute angle—about 120.° The old splint on being removed was found to be too narrow, the lower lip of the wound projecting over the edge, thereby becoming œdematous. Evidences of cicatrization are showing themselves. The under surface of the limb was perfectly sound. No pain was complained of consequent upon bending the arm in the new splint. Has considerable motion of both little and ring fingers, and thinks he has some sensation in the latter. There is no constitutional trouble whatever. The limb is dressed with Scultetus's bandage, balsam Peru being applied to the wound. Treatment continued. May 11th, since last date the arm has been progressing very favorably. No disturbance followed the change of splint. The wound is nearly filled with healthy granulations and cicatrization is advancing. Some collection of pus occurred a few days since over site of external condyle, due to the adhesions of the granulations of the main wound. These were broken down by a probe and free vent established. Wound dressed with Hays's lotion and many-tailed bandages. General condition excellent. May 23d, for the last five or six days the arm has been raised daily from the splint and passive motion to a slight extent resorted to, not causing any pain to the patient. The wounds are closing up rapidly. The opening noticed at last date closed up rapidly in spite of tents, and a small abscess formed at upper portion of cicatrix of incision and discharged *sua sponte*, completely draining the granulations. General and local condition admirable. Wounded arm rests on a pillow. June 23d, since last note patient has steadily improved. Is now up and about, carrying the arm in a sling at an angle of about 40.° Passive motion is daily resorted to and well borne. One or two small scales of bone have cast off. The wounds remaining are of small size, and rapidly closing. General condition excellent. July 2d, at his own request the patient has been discharged from service to-day. The arm has been doing admirably, and but two small ulcers are now seen, one at the seat of the original wound and the other at site of the operation. No dead bone is felt. Flexure and extension are almost perfect, though some obstructions from muscular adhesions are found in pronation and supination. Patient was ordered to continue passive motion. On August 1, 1862, he wrote to me that his arm is doing very well, that the ulcers had healed, strength in arm was increasing, and motion of articulation very perfect; also that sensation in the little finger was still absent, though motion exists." The specimen (FIG. 616) consists of the excised parts, the articular surfaces of which are carious. It was contributed by the operator. Examiner H. Pierpoint, of New Haven, Connecticut, certified April 27, 1863: "Was wounded through the left elbow joint, resulting in resection of the joint, but has an arm reflecting much credit upon the operating surgeon." Examiner C. H. Rawson, of Des Moines, Iowa, January 1, 1873, certified: "Exsection, &c. The limb is two and a half inches shorter than the right; it is one inch smaller below the joint and two and a half inches less around the humerus. Can flex forearm and carry it to the head, but has no power of extension. Can rotate forearm on arm. Circulation in the limb is good except slight tendency in two lesser fingers to coldness," &c. The disability was rated total, third grade. The pensioner was paid June 4, 1875.

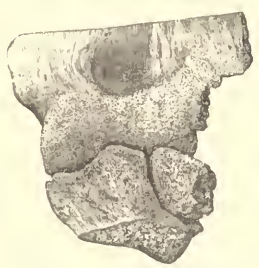

FIG. 616.—Portions of left humerus, ulna, and radius excised for shot injury. *Spec.* 838.

Case 1794.—Private *J. Harris*, Co. D, 2d North Carolina Cavalry, aged 40 years, was wounded at Gettysburg, July 3, 1863, and admitted to Frederick Hospital three days afterward. Acting Assistant Surgeon J. C. Shimer reported the following minutes of the case: "A minié ball entered the right arm posteriorly about two inches above the elbow, passing through the joint, and emerging on the ulnar side about four inches below the joint, fracturing and comminuting the ulna. The patient's general health at the time of admission was somewhat depraved and suffering greatly from the wound. Cold-water applications were used for the arm, stimulants administered internally, with generous diet, and opiates given to produce rest and sleep. July 15th, eight small fragments of bone were extracted from the forearm and two small spiculæ from the wound of exit. The patient's general health remains about the same; appetite but little improved. He takes three ounces of whiskey and twelve grains of sulphate of quinine daily, and sulphate of morphia in the evening. Arm still painful and is becoming somewhat swollen. July 20th, bowels a little constipated; ordered a dose of sulphate of magnesia in the evening. Arm not quite so painful; a healthy suppurative process going on; wound injected daily with a diluted solution of chlorinated soda to counteract impure smell. July 25th, arm put into an Ald felt splint, fitting nicely; walks about, and does not suffer much pain; swelling somewhat subsided; is able to flex fingers as well as elbow to a slight extent; has a cough, for which expectorants were ordered. July 29th, condition of arm much worse; it is becoming enlarged and very painful. To-day the joint was resected. The operation consisted of the removal of about three inches of the humerus and one-fourth of an inch of ulna (olecranon process). Applications of powdered ice to the arm were used; stimulants and beef tea administered. July 31st, patient doing well; suffers no pain; wound discharging freely; pulse 96; appetite moderate; slight diarrhœa, for which opium is given. Patient takes generous diet; has some cough and expectorates yellowish thickish sputa. Ordered mild stimulating expectoratives. August 1st, swelling somewhat subsided; less tenderness; appetite improving; rests comfortably. August 3d, has had chills two evenings in succession, followed by fever. Ordered sulphate of quinine, three grains every four hours; discontinued iron. Diarrhœa about the same; twenty drops of tincture opii given after each stool. Pulse 100; still has cough; arm looking well; œdema gradually subsiding; rests well; had five passages in the evening. August 4th, had three passages last night, no chills; pulse 102; wound dressed with balsam; arm looking well. August 6th, tongue cleaning off; pulse 100 and rather feeble; had three passages during the night; arm looks well; patient improving. August 7th, patient a little delirious; tongue looking better; pulse 98; coughs a great deal and expectorates freely; appetite still very poor; diarrhœa about the same; dressing of arm continued; complains of pain in chest; some dulness on percussion. August 9th, patient seems to be sinking; pulse 124 and very feeble; still complains of a great deal of oppression in chest; diarrhœa worse. Ordered tincture opii forty-five drops, and starch water, to be given per rectum twice daily. He also complains of great thirst; ordered plenty of broken ice. August 10th, no marked change, the wound looking well. Swelling very nearly subsided and the arm looks natural in size. August 13th, pulse 100; diarrhœa worse again. Discontinued the use of injections and ordered pulverized opium, one grain every hour. August 14th, diarrhœa decidedly better. Discontinued the free use of opium and gave it moderately. Patient improving; seems to be more cheerful; appetite a little improved. August 15th, complains of considerable pulmonary trouble; diarrhœa completely checked. Applied blister over seat of pain. August 17th, appetite still improving. Placed arm in an angular splint, bound fast to the limb to enable him to sit up in bed; discontinued the use of powdered ice to arm, as the inflammation and swelling has entirely subsided. Wound cicatrizing nicely; flexes the fingers slightly; loss of sensation in little and ring fingers; still some œdema of hand. The arm is brought to an angle between an obtuse and a right angle. August 27th, passive motion of arm practised daily. Is able to walk about the ward and has better relish for food. Patient doing well. September 2d, is not so well to-day; an abscess formed below the joint; considerable inflammation. Ordered patient to be put to bed and applied ice. Wound of exit discharging freely; slight diarrhœa, for which he is taking stimulants and tonics. September 16th, still indications of phthisis. Has a dry cough, night sweats, and swelling of the extremities; appetite good; arm looking well. September 23d, for a few days past has complained of incontinence of urine. Ordered fluid extract of buchu and sweet spirit of nitre half a drachm each, every two hours. Also complains of great pain in lumbar region; ordered blister to be applied. October 1st, patient experiencing relief; doing well with the exception of neuralgic pain in hand and ulnar side of arm; takes a moderate amount of whiskey daily, with generous diet. The wounds have healed and the splints are removed. There is a good deal of motion of the joint; patient can flex his wrist slightly. October 30th, pain in arm and hand becoming more intense, relieved by applications of opium and belladonna plasters, tincture iodine, chloroform, tincture opii, etc. Symptoms of pulmonary trouble disappeared. November 2d, patient still experiencing much pain in arm and hand; otherwise doing well; he receives a pint of porter daily. November 30th, pain in arm subsided, but increased in hand. Treatment continued. December 10th, suffers excruciating pain in hand; anodynes freely administered to deaden sensibilities, and opiates and lotions externally. Wound of entrance again discharging; necrosed bone found on probing. January 25th, extracted small fragments of bone from opening near hand, followed by some relief from pain. Treatment: poultice externally and opium pills internally. April 29th, treatment continued; slight improvement in motion of arm and slight abatement of neuralgic pain; otherwise the patient remains the same. May 5th, transferred to hospital in Baltimore." Assistant Surgeon R. F. Weir, U. S. A., who performed the resection in this case, contributed the specimen (Fig. 617), consisting of the excised upper half of the olecranon and three inches of the lower extremity of the right humerus. A complete fracture was produced by the missile from the point struck, just above the inner condyle, through the trochlea. A space at the point of impact about the calibre of the bullet is necrosed, between which some periosteal inflammation has occurred. A cast of the injured elbow, made after the removal of the bony articulation, was contributed by Dr. Shimer, showing the arm in a semi-flexed position, that amount of motion being attainable in it. (*Cat. Surg. Sect.*, 1866, p. 536, *Spec.* 2570.) On May 9th the patient entered the post hospital at Fort McHenry, whence Surgeon J. H. Currey, U. S. V., reported his transfer to the post prison on July 21, 1864, and his subsequent removal to Point Lookout, "the wound having healed, but the bones not united."

Fig. 617.—The tip of the olecranon and three inches of the humerus excised for shot injury. *Spec.* 3912.

Attention has been repeatedly directed to the fact that the records of the Pension Bureau represent the results of wounds and mutilations in the least favorable light, the certificates of the examiners being generally drawn so as to secure for the pensioner the largest allowance he may be entitled to receive under the provisions of the law. This is especially true in regard to the results of the excisions of joints, many men being returned as more or less unfit to follow their callings, although they have fairly useful limbs. Professor B. v. Langenbeck[1] has commented on the misleading effects of this cause in Germany, whereby misapprehension has arisen respecting the results of excisions in military practice, and a somewhat embittered controversy, in which Professors Hannover, Lœffler, and Neudörfer engaged.[2]

CASE 1795.—Private C. H. Gove, Co. I, 145th New York, aged 18 years, was wounded at Chancellorsville, May 3, 1863, by a minié ball, which entered the anterior aspect of the forearm above the middle, and made its exit through the olecranon process. On May 8th, resection of the olecranon process (and probably of the articular extremities of the humerus, radius, and ulna, as the interspace between the ends of the bones was very considerable) was performed on the field by a Confederate surgeon; and an angular splint was applied, with cold-water dressings. Gove was a prisoner for thirteen days after he was wounded; but in June was sent to Washington, was treated at Mount Pleasant Hospital, and thence transferred to Satterlee Hospital, Philadelphia, where he was received June 21st. Acting Assistant Surgeon T. G. Morton reported that "the wound was then sloughing; the use of the splint and cerate dressing was continued for about three weeks, when the splint was removed. The wound nearly healed, leaving the joint with its movement impaired and the arm semi-flexed," and the patient was discharged the service November 21, 1863, and pensioned. Mr. Gove visited the Army Medical Museum February 3, 1873, and a photograph, represented by the cut (FIG. 618), was then taken. A memorandum made at the time states that there was good use of the hand and very fair use of the forearm. Examiner H. L. Dodge, of Boston, reported, November 24, 1863: "There is great separation between the bones of the arm and the forearm." Examiner G. S. Jones reported, October 6, 1866: "The forearm is powerless and useless." The last examination of the pensioner was made under Surgeon Thomas Franklin Smith, of New York, September 17, 1873, who reported: "Complete resection of the right elbow joint. The hand hangs to the side, and for purposes of manual labor the disability is equal to the loss of the arm." Pensioner was paid March 4, 1874.

FIG. 618.—Results of a primary excision at the elbow for shot injury.

CASE 1796.—Private J. H. Stark, Co. M, 7th Indiana Cavalry, age 22 years, was wounded in the left arm, while on scout near Memphis, October 22, 1864, and underwent excision of the elbow joint at the Adams Hospital. Assistant Surgeon J. M. Study, U. S. V., who performed the operation, furnished the following report: "The ball (conical) entering the left arm one inch above the olecranon process, detaching the condyles from the shaft of the humerus and separating them from each other at the same time, passed forward through the joint and lodged under the integument on the anterior aspect of the forearm, midway. The entire forearm became much swollen, and the parts adjacent to the elbow joint tense and livid. October 31st, a deep incision was made, four inches in length, from a point one inch above the entrance of the ball downward, the forearm forcibly flexed, and the articular surface of the upper extremity of the radius and the olecranon process of the ulna sawn through, the fractured end of the shaft of the humerus sawn off squarely, the wound cleansed, and its margin brought together by four stitches, the arm in nearly a straight position placed upon a pillow, and cold applications directed. Chloroform was used; hæmorrhage was slight. The patient did remarkably well. December 31st, the patient is going about the ward, and able to rotate and flex the forearm." The specimen, represented in the annexed cut (FIG. 619), and consisting of the olecranon and two inches of the lower extremity of the left humerus, was contributed by the operator. The patient was discharged from service May 13, 1865, and pensioned. Examiner J. G. Hendrick, of Madison, Indiana, November 8, 1865, reported: "The ball entering posterior face of the humerus, between the condyles, passed through the elbow joint, and was cut out in the upper third of the forearm. An inch and a half of the lower end of the humerus was resected, making a false joint, and leaving the forearm and hand entirely useless." Examiner W. A. Collins certified, September 17, 1873: "Gunshot wound, excision, etc., greatly impairing the use of the arm, the muscles of the arm being almost completely lost at this time by atrophy. Disability third grade and permanent." The pensioner was paid June 4, 1875.

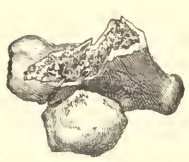

FIG. 619.—The olecranon and two inches of the lower extremity of the left humerus excised for shot injury. *Spec.* 3606.

[1] In his address at the third session of the Second Congress of the German Surgical Society, at Berlin, April 18, 1873: *Über die Endresultate der Gelenkresectionen im Kriege*, in LANGENBECK'S *Archiv. für Klinische Chirurgie*, B. XVI, 1874, and since republished in his *Chirurgische Beobachtungen aus dem Kriege*, Berlin, 1874. In Europe, as in this country, the difficulty lies in framing laws that shall definitively adjudge relief to different classes of invalids in equitable proportion, according to their degree of disability. The points of view of the practical surgeon and of the pension examiner are, of necessity, different. The operator is rejoiced where his patient recovers with a limb useful for many purposes. The pension examiner, acting under strict instructions, returns the same limb as useless, in the sense that it is of no service to the pensioner's particular vocation.

[2] Prof. DOUTRELEPONT and Dr. HUGELSHOFER subsequently discussed the matter in a more judicial spirit.

While, as a rule, the performance of excisions of the elbow joint for injury during the inflammatory stage is greatly to be deprecated, it cannot be denied, that such operations have achieved felicitous results. The two following examples prove this:

CASE 1797.—Private W. T. Riley, Co. D, 86th New York, aged 21 years, was accidentally wounded by a comrade, near Mine Run, November 26, 1863, and was admitted into Mansion House Hospital, Alexandria, on the same day, having bled quite largely on the way. Acting Assistant Surgeon C. W. Kœchling noted as follows: "The ball entered the right arm a little above the internal condyle of the humerus, fracturing it, and emerging through the olecranon process. When admitted, the whole arm was greatly inflamed and swollen; several pieces of bone were extracted and cold-water dressings applied. December 19th, patient was in good condition for an operation, and resection of the elbow joint was performed by Surgeon Charles Page, U. S. A. The patient was put under the influence of chloroform, and an incision three inches long was made over the exterior surface of the arm, and another of the same length over the olecranon process of the ulna; the transverse section was then made, and the flaps dissected back, and two and a half inches of the inferior extremity of the humerus, one inch of the upper extremity of the ulna, and a small portion of the head of the radius were removed. Very little hæmorrhage occurred. The wound was dressed with cold-water dressings. December 20th, the patient rested well during the night; he complains of a little pain in the arm; pulse 100; appetite poor. December 21st, renewed dressing; appearance of wound very good; discharge healthy." The case progressed most favorably, and in May, 1864, Riley went to his home on furlough with a useful arm, and on October 21, 1864, was discharged the service. In 1865, he re-enlisted in Co. K, 5th regiment, First Corps, with the approval of Lieutenant Colonel Dougherty, Medical Director of the Corps. "The man went through the manual before me," Surgeon Dougherty writes, "and stated his readiness to do all the duties of a soldier. He wished it recorded that he was competent and prepared, in order that during the term of his service he might be held to full duty. The degree of motion was perhaps one-third of the normal amount." In July, 1865, Riley visited the Army Medical Museum, and a photograph was taken, which is copied in the right-hand figure of PLATE LIII, opposite page 850, and in the wood-cut (FIG. 621). The specimen (FIG. 620) consists of "two and a half inches from the lower extremity of the right humerus excised. One inch of the upper extremity of the ulna and a small portion of the head of the radius were removed at the same time, but have not been preserved. Two incomplete longitudinal fractures, one on each surface of the shaft, arise from the lower border. The trochlea is destroyed, the outer condyle shattered, and the inner condyle separated by an oblique fracture. Superficial necrosis exists over much of the specimen, the remainder showing reparative periosteal disturbance. Contributed by Acting Assistant Surgeon C. W. Kœchling." (See *Cat. Surg. Sect.*, 1866, p. 158.) Examiner C. M. Crandall, of Belfast, New York, reported, December 28, 1866: "The arm is much more shortened; the flexor muscles of the forearm more contracted, so that the arm is fixed at near a right angle and is subject to suppuration near the elbow." Examiner J. W. Graham, of Utah Territory, October 9, 1873, reported: "Resection was performed with but partial success; disability total." [!] This pensioner was paid March 4, 1873.

FIG. 620.—Caries of lower extremity right humerus after shot fracture.

FIG. 621.—Appearances two years after a complete excision of right elbow joint.

CASE 1798.—Corporal J. Pattne, Co. C, 39th New York, age 20 years, was wounded at the Wilderness, May 6, 1864. The ball was extracted on the field and the wound dressed in a Second Corps hospital. He was sent to Washington on May 13th was admitted to Finley Hospital, where he was operated on by Surgeon G. L. Pancoast, U. S. V., who reported: "Gunshot fracture of elbow joint, fracturing the olecranon process and condyles of the humerus. On May 25th the patient was chloroformed, and the humerus one inch above the condyles, and the heads of the radius and ulna were removed. At the time of operation the joint was much swollen and painful; there was great discharge of pus, and of small pieces of bone occasionally; the olecranon was movable. His constitutional condition was not very good. Cold-water dressings were used, and the wound healed kindly by healthy granulations." The specimen, shown in the wood-cut (FIG. 622), was contributed by the operator. It consists of three inches of the lower extremity of the left humerus excised. The specimen shows a complete oblique fracture in the lowest part of the shaft, complicated with a perpendicular one directly through the trochlea, of which the central portion is missing. On the posterior upper border of the transverse fracture is a moderate collection of callus. The olecranon was fractured but was not preserved with the specimen. The patient remained in Finley Hospital until July 13, 1865, when he was transferred to New York and entered De Camp Hospital, whence he was discharged the service November 7, 1865, and pensioned. On November 16th the patient was fitted with an apparatus by Dr. E. D. Hudson, who reported that the limb was shortened two and three-fourths inches, with an interspace of one and a quarter inches. On December 25, 1865, the photograph of the patient, represented in the cut (FIG. 623), was taken, and was contributed to the Army Medical Museum by Assistant Surgeon Warren Webster, U. S. A. The wound was at that time completely healed, and the pensioner enjoyed valuable use of his arm and hand. Examiner T. F. Smith, of New York, January 30, 1866, reported: "Bullet shot of right elbow, with resection of the elbow joint; the forearm hangs like a flail, so that he has no use of it. The pensioner was last paid March 4, 1870, since which time he has not been heard from by the Pension Bureau.

FIG. 622.—Posterior view of the lower extremity of a right humerus excised for shot injury.

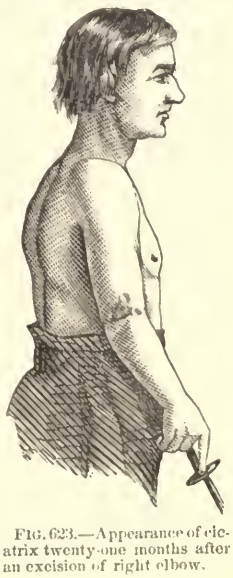

FIG. 623.—Appearance of cicatrix twenty-one months after an excision of right elbow.

Sixty-two, or nearly one-half of the one hundred and twenty-seven patients who recovered after intermediary excisions at the elbow, are reported to have complete anchylosis at the elbow,—such a large proportion that it seems probable that the term may have been applied, in some cases, where the joint permitted only very limited motion. A number of examples of this termination will be detailed:

Case 1799.—Private F. A. Dixon, Co. A, 1st Maryland regiment, Potomac Home Brigade, aged 18 years, was wounded in the left arm at Winchester, July 24, 1864. Three days afterward he was admitted to Frederick Hospital, where he was operated upon by Assistant Surgeon R. F. Weir, U. S. A., who reported as follows: "Gunshot wound, fracturing inner condyle of left humerus. July 29th, exsection of elbow joint. Patient did pretty well. The wound of incision had cicatrized by October 15th. Used an angular tin splint for a month; arm resting on pillows the rest of the time. A few fragments of necrosed bone were removed. November 20th, patient has very little flexion at elbow, and some rotation. January 20th, Motion continues the same. There is an opening and a sinus leading to dead bone, not yet loose. Patient's health is good." He was discharged from service on June 17, 1865, by reason of "anchylosis of left elbow joint, resulting from the injury." The specimen (Fig. 624) consists of the olecranon and one and a half inches of the lower extremity of the humerus. It was contributed by the operator. Examiner G. W. Wayson, of Baltimore, December 15, 1865, certified: "The ball entered above the elbow, shattered that joint, and passed out near the wrist joint, entirely disabling the arm and anchylosing the joint; the wound has not healed." Examiner W. H. Baltzell, of Frederick, September 29, 1873, describes the wound, and says: "The arm is anchylosed in a semi-flexed position, and two sinuses communicate with exfoliating bone. The fingers and thumb are distorted and anchylosed in the position of extension. The pensioner was paid June 4, 1875.

Fig. 624.—Excised condyles of the left humerus and the olecranon. *Spec.* 3948. ½

Case 1800.—Private J. D. Douglass, Co. G, 63d Pennsylvania, aged 19 years, was wounded at Fredericksburg, December 13, 1862, and admitted to the field hospital of the 1st division, Third Corps, where Surgeon J. M. Cummings, 114th Pennsylvania, recorded: "Compound fracture of left humerus." Assistant Surgeon C. Wagner, U. S. A., in charge of the Point Lookout Hospital, contributed the specimen (*Cat. Surg. Sect.*, 1866, p. 157, *Spec.* 925), which is illustrated in Plate LI, Fig. 5, with the following description of the case: "The patient was wounded by a minié ball, which entered on the external aspect of the left forearm about over the neck of the radius, and made its exit just above the inner condyle, shattering, in its course, the radius at its neck, and breaking off portions of the coronoid process, internal aspect of the olecranon, and the trochlea. The patient was admitted on December 16th, and, on January 12th, resection of the injured bones was performed by Assistant Surgeon W. H. Gardner, U. S. A. The joint having been exposed by the quadrilateral flap operation of Moreau, the radius was sawed off just below its tuberosity. The upper extremity of the ulna and the articular surface of the humerus were also removed. After the operation the limb was laid on a cushion with the forearm pronated and slightly flexed. When last seen, on March 6th, the movements of the joint were tolerably free, extension full, flexion about five degrees above a right angle, slight pronation and supination, and the movements increasing almost daily."[1] The specimen consists of one-fourth inch of the articular extremity of the humerus, and nearly two inches of the radius and ulna divided just below the coronoid process. It is disorganized by caries. In April, 1863, the patient was transferred to the Pittsburg Hospital, whence he was discharged December 26, 1863, and pensioned. Examiner O. Ayer, of LeSueur, Minnesota, December 19, 1868, certified; "Anchylosis of left elbow joint. In the humerus, some four inches from the lower extremity, there is a false joint, the result of an ununited fracture which occurred in 1864 (since his discharge from service). The muscles of the arm and forearm are much diminished in size, and the arm is of but little use." Examiner S. Willey, of St. Paul, Minnesota, certified, November 26, 1869: "No use of hand or arm; complete anchylosis of elbow; muscles of arm, forearm, and hand attenuated and flabby, so as to have lost all muscular outlines; muscles of left shoulder all emaciated, and much pain of a neuralgic character in shoulder, arm, and hand. Disability permanent and equivalent to loss of hand." The pensioner was paid September 4, 1875.

Case 1801.—Private J. L. Mortimer, Co. C, 67th Pennsylvania, aged 40 years, was wounded at Petersburg, March 25, 1865, and was treated in the depot hospital at City Point, thence transferred to Washington, and admitted to Mount Pleasant Hospital on April 2d. Assistant Surgeon H. Allen, U. S. A., the operator, noted: "Admitted with gunshot wound of the right upper extremity, compound comminuted fracture, involving elbow joint; ball entered at the outer side of the head of the elbow and emerged one inch internal to and above the olecranon, fracturing the external condyle. On April 5, 1865, the patient was anæsthetized by equal parts of ether and chloroform and an incision was made from the outer border of the head of the elbow, posteriorly, to the inner border. The articular surface was removed by the saw; of the ulna and radius by gouging with forceps. Four ligatures were applied to small branches. There was considerable oozing from the bone. At the time of operation the forearm and hand were œdematous, the swelling extending above the elbow; the wounds had an unhealthy appearance and an unhealthy pus exuded from them; the general health was good. The after-treatment consisted of simple cold-water dressings, and afterward lead and opium wash; tonics, stimulants, and nourishing diet. The wound healed rapidly, and the patient was transferred to Philadelphia." He was admitted to Mower Hospital May 18, 1865, and thence discharged the service, with anchylosis of the elbow, June 29, 1865, and pensioned. The specimen (Fig. 625), consisting of the articular extremity of the right humerus sawn just above the condyles and excised for fracture of the external condyle, was contributed by the operator. In September, 1873, Examiner W. J. Mullin, of Shellsbury, reported: "The arm is wasted and badly deformed; disability total." Pensioner was paid March 4, 1874.

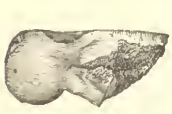

Fig. 625.—Excised condyles of humerus, shattered by shot. *Spec.* 72. ⅓

In many avocations, anchylosis at the elbow at a favorable angle, if associated with control of the functions of the hand, is a less serious disability than a loose, flail-like

[1] Compare reports of this case in *Am. Jour. Med. Sci.*, 1863, Vol. XLVI, p. 38, and *Boston Med. and Surg. Jour.*, 1863, Vol. LXVIII, p. 251.

connection between the arm and forearm. The latter condition, it is true, can be remedied to a certain extent by mechanical contrivances; but the stiff joint is the least of the two evils. It gains this distinction, however, only on condition that the anchylosis is effected in a good position of semiflexion, without extreme forced pronation or supination.[1]

CASE 1802.—Captain Richard N. Doyle, Co. H, 8th Michigan, aged 34 years, was wounded at James Island, June 16, 1862, and was admitted to hospital at Hilton Head on June 20th. On June 23d he was sent on a hospital steamer to De Camp Hospital, New York Harbor. Surgeon S. D. Gross, U. S. V., made the following special report: "The patient was wounded by a conoidal ball, which produced a comminuted fracture of the left elbow joint. He was admitted into the general hospital at David's Island, New York Harbor, on June 27th, and on the 1st of July Acting Assistant Surgeon W. K. Cleveland resected the joint, making a single straight incision. The articular surfaces of the humerus, ulna, and radius were removed, and were badly shattered. The case progressed badly, abscesses being of frequent occurrence about the joint, and at the latter part of September a large abscess, extending to the axilla, was opened and discharged a pint and a half of pus. At the present time, February 14, 1863, there is bony anchylosis of the joint, and dead bone can be detected with the probe. As far as regards motion of the joint the operation is a failure." On March 26, 1863, the patient was returned to duty, serving with his regiment until April 22, 1864, when he was admitted to No. 1, Annapolis; again returned to duty June 11, 1864. He was promoted Major August 20, 1864; Brevet Lieutenant Colonel April 2, 1865; and was mustered out July 30, 1865, and pensioned. The photograph, represented by the cut (FIG. 626), was forwarded to the Army Medical Museum by Examiner E. R. Ellis, of Grand Rapids, Michigan, April 24, 1866. In addition to the foregoing history, Dr. Ellis states: "About December 1, 1862, an operation was performed for the removal of portions of necrosed bone; quite a large fragment was removed. And again on the last of May, 1863, Surgeon Goldsmith, of Louisville, Kentucky, removed a portion five inches long and nearly three-quarters of an inch in diameter. On April 16, 1864, several smaller pieces of bone were removed at Annapolis. The enclosed photograph gives a good representation of the limb. It is seen to be somewhat smaller and shorter than its fellow. The dark lines on the inner surface are cicatrices where abscesses have been opened. There are five or six smaller ones on other parts of the arm, not shown. There is anchylosis of the elbow, of course, and the rotary motion of the forearm is lost. Altogether the limb is somewhat serviceable, and quite valuable in preserving the symmetry of the body." This pensioner was paid December 4, 1873.

FIG. 626.—Appearances after an early intermediary excision of the left elbow for shot injury, four years after the operation.

CASE 1803.—Private J. Graisberry, Co. D, 6th New Jersey, aged 24 years, was wounded in the right elbow joint at Bull Run, August 29, 1862, and entered the College Hospital, Georgetown, on September 5th. Assistant Surgeon B. A. Clements, U. S. A., who operated in this case, reported the following history: "The patient was wounded by a minié ball at a distance of seventy-five yards, which fractured the olecranon process of the ulna. He did not suffer much. The operation of excision was performed three weeks after the injury. Both condyles of the humerus, the head of the radius, and all of the ulna above the coronoid process were removed. On January 1, 1863, one small piece of bone was discharged. The wound then immediately closed, leaving complete anchylosis. The bone was removed by a ⊤ incision. There was typhoid fever at the expiration of one month after the operation. Health now good; limb is strong; sensation in hand perfect; motion of hand almost perfect; slight stiffness of joints. He has the use of the hand and fingers, but the usefulness of the whole hand is materially impaired. Perfect anchylosis of the elbow has taken place in the extended position of the forearm. This is the result of an accident,—the forearm was nearly at right angles with the arm, when he stepped into a hole while walking, the hand and forearm falling heavily to the extended position, where it has ever since remained." The excised parts, represented in the annexed cut (FIG. 627), the articular surfaces being carious, were contributed to the Museum by the operator. On February 2d the patient was transferred to Stanton Hospital, Washington, whence he was discharged February 18, 1863, and pensioned. Drs. H. E. Goodman, J. Collins, and T. H. Sherwood, of the Philadelphia Examining Board, December 6, 1873, certified: . . . "Joint anchylosed in a straight position, arm atrophied, and hand almost useless; not equivalent to loss of hand." The pensioner was paid June 4, 1875.

FIG. 627.—The lower end of the right humerus and portion of the radius and ulna excised for shot injury. *Spec.* 327. ½

[1] LANGENBECK (B. v.) (*Chir. Beobachtungen aus dem Kriege*, Berlin, 1874, p. 183): "It is now the question, whether we should strive to cause anchylosis after resection of the elbow, or a movable joint. According to my view, this question cannot yet be finally decided, as we do not know whether every dangle-joint can be changed into an active mobile joint by appropriate treatment at the proper time. That an anchylosed joint is far preferable to a dangle-joint, as in cases Nos. 35 and 36 [two instances of loose-joint—*Schlotterverbindung*—reported by Herr v. LANGENBECK], cannot be disputed. But should it be possible to achieve, after resection of the elbow joint, as favorable results as, for instance, in cases Nos. 25, 29, and 34 [cases in which dangle-joints were converted into useful limbs by appropriate after-treatment], a movable limb would be preferable. If LOEFFLER (*l. c.*, p. 270) contends that we should appreciate more highly the cure of excision of the elbow joint with anchylosis, and that under certain circumstances, this result must be considered as one to be desired, I agree with him fully, but only on the express condition that the anchylosis sought for shall nearly approach a rectangular one."

The next case illustrates the group of seventeen successful excisions of the articular ends of the ulna and radius, without removal of any portion of the humerus:

CASE 1804.—Private J. Hastings, Co. K, 19th Indiana, aged 21 years, was wounded at South Mountain, September 14, 1862, and entered Hospital No. 1, Frederick, on the 18th. Acting Assistant Surgeon W. W. Keen, jr., described the injury as follows: "The ball entered the posterior part of the left forearm four inches below the elbow joint (the arm being flexed at the time), passed through the elbow joint, and made its exit one and a half inches above. On the battle-field, the surgeon opened the arm at the joint and removed several pieces of bone, varying in size from two inches in length to small fragments." Acting Assistant Surgeon J. H. Barthолf, who excised the elbow joint, furnished the following detailed history: "Wound in elbow joint; upper extremity of the ulna badly shattered. September 25th, general condition not good. Free suppuration. September 28th, operation: one linear incision was made from the tip of the olecranon to four inches along the line of the ulna; the head of the ulna was disarticulated without difficulty, and the olecranon and coronoid processes and one inch of the shaft to the point of the fracture were removed, and also two inches of the radius, it being found injured one and a half inches from its upper extremity. Several fragments of the ulna were removed, and the upper extremities of the lower fragments of both bones sawn off. The loss of blood was trifling. The patient's condition after the operation was good. Loss of continuity in ulna five inches, and of radius one-half inch. October 3d, patient doing well; wound free from accumulation of pus. October 4th, good symptoms continue. October 10th, placed arm in an angular wire splint, which secures immobility of elbow joint and permits the patient to leave his bed and go out-doors. October 14th, patient doing well; goes around the barrack and out-doors. October 18th, granulations are looking healthy and have entirely filled up the cavity; discharge has nearly ceased. There is one and a half inches shortening, the sound arm being fifteen inches from the epicondyle to the distal end of the metacarpal bone of the index finger, the injured limb thirteen and a half inches. October 19th, discharge ceased; cicatrization nearly complete; shortening two inches. November 6th, sloughing to a small extent has taken place in the granulating surface; amount of granulating surface left is small. The splint was removed, but patient has no muscular control of motion in joint. Callus is believed to have been thrown out in the track of the removed bone; splints reapplied. November 10th, nitric acid had been applied to the wound on the 6th and 9th inst., but the character of the wound is still sloughy; appetite and general condition pretty good. November 16th, through the continued application of nitric acid the sloughing has been arrested, and the wound appears quite healthy. December 8th, wound not entirely healed. Patient has slight motion in fingers, and, when the splint was removed, could bend the wrist. Union at the elbow is not yet very firm. Passive motion is now in use and may improve the joint. December 16th, symptoms of gangrene appeared in the wound to-day; strong nitric acid applied. General condition excellent. December 18th, gangrene disappeared. January 15th, arm slowly progressing—still in splint. Has pretty good motion in fingers, but cannot pronate or supinate the hand. January 23d, wire splint removed to-day, when it was found that the shoulder joint was rather stiff from being so long confined. Moved the elbow, and found the fingers described an arc of about four inches. Ordered splint to be removed entirely and employed passive motion. January 29th, arm improving under passive motion; can almost bring his hand to his mouth; condition excellent. February 1st, has some diarrhœa. Ordered castor oil and tincture of opium. February 2d, arm improving. General condition pretty good. Diarrhœa not yet stopped. February 6th, diarrhœa stopped; motion in arm good; patient able to bring it to his mouth." The specimen (FIG. 628) consists of the olecranon and coronoid processes and two and a half inches of the shaft of the left ulna, and the head and one inch of the shaft of the radius. The shaft of the ulna is completely comminuted, and that of the radius has several partial fractures. It was contributed by the operator. The patient was discharged from service February 7, 1863, and pensioned. Examiner W. Freeman, of Pennville, Indiana, September 21, 1873, certified: "The ball entered on ulnar side of arm and came out above condyle of humerus. The joint has been resected. There is very little motion at the resected point, and the arm is flexed nearly at a right angle; the biceps and triceps muscles are very much atrophied. The disability is equivalent to the loss of an arm and is permanent." This pensioner was paid December 14, 1874.

FIG. 628.—The olecranon and coronoid processes and portions of the ulna and radius excised. *Spec.* 749.

Eleven of the survivors of this series submitted to ulterior amputation:

CASE 1805.—Private J. Campbell, Co. A, 62d Pennsylvania, aged 25 years, was wounded at Malvern Hill, July 1, 1862, and entered Judiciary Square Hospital, Washington, three days afterward. Acting Assistant Surgeon D. W. Cheever contributed the specimen [*Cat. Surg. Sect.*, 1866, p. 153, *Spec.* 15, shown in PLATE LI, FIG. 1, opposite], with the following history: "The ball entered the right arm at the outer condyle of the humerus, and emerged on the inner side, near the bend of the elbow, and apparently in front of the coronoid process. July 13th, the arm has become extensively swollen, red, and painful; both wounds are suppurating; constitutional state fair. Explored under ether and found the outer condyle smashed up, and also the head of the radius. The injury had probably extended into the ginglymoid articulation also; at any rate the joint is open and liable to suppurative action extending itself from the injured trochlear surface. July 14th, the elbow joint was excised by an H incision. The radius was found to be split below the tubercle and was removed to that extent. The flaps were brought together with stitches and adhesive straps, the arm supported by an inside felt splint and a cold compress applied. July 17th, arm swollen; discharge of good pus; constitutional state fair; granulations exuberant. July 19th, capillary bleeding from wound, checked by ice; stimulants diminished. July 20th, doing well again. July 21st, copious bleeding from inner wound. Arm amputated." The specimen consists of the excised bones of the elbow, the line of section in the humerus being just above the condyles, in the ulna just below the coronoid process, and in the radius just below the head; only a portion of the latter is preserved. The patient was discharged from service August 29, 1862, and pensioned. Examiner G. McCook, of Pittsburgh, Pennsylvania, certified: "Amputation of right arm above elbow joint." In his application for commutation, dated 1870, the pensioner stated that "Dr. George L. McCook performed a second operation," and described "the length of the remaining stump as two inches from the shoulder joint and its condition as not very good." This pensioner died on June 4, 1873.

No instance appears on the returns in which excision was attempted in shot fractures of the elbow complicated by injury of the brachial, radial, or ulnar arteries. In the preceding subsection, however, at page 839, an instance is adduced, in which such a lesion was successfully dealt with by ligation of the radial and conservative expectant treatment of the fracture, while two fatal cases of the same sort appear on page 843. Since the war, a marvellous observation of shot comminution of the elbow, with laceration of the brachial, ulnar, radial, and interosseous arteries, ulnar and median nerves, and median vein, has been published by Dr. T. Curtis Smith, of Middleport, Ohio.[1] If the diagnosis be accepted as incontestable, the result of this case would refute the view heretofore generally entertained, that such lesions render amputation imperative.

As has been stated, eleven, or 8.6 per cent., of the one hundred and twenty-seven patients submitted to consecutive amputation,—demanded in three cases by consecutive hæmorrhage, as in an instance cited on the preceding page; in two cases for spreading gangrene; and, in six cases, for necrosis of the extremities of the bones contiguous to the excised parts. The following is an example of the last group:

CASE 1806.—Private P. D———, Co. D, 69th New York, aged 29 years, was wounded at Antietam, September 17, 1862. He was admitted to the field hospital of the 1st division, Second Corps, where Surgeon J. H. Taylor, U. S. V., recorded: "Wound of right arm." On September 24th, the patient entered Hospital No. 5, Frederick, where Surgeon H. S. Hewit, U. S. V., excised the elbow joint and subsequently amputated the arm. The following account of the case was furnished by the operator: "A conoidal ball fractured the elbow joint. Resection was performed on October 2d. The after-treatment consisted of yeast poultice and applications of tincture of iodine to the arm. December 4th, no perceptible improvement. Resection was again resorted to in hopes of saving the arm, but the damage was found to be so great that it was decided to amputate the arm near the shoulder. (See CASE 33, TABLE LXXXIV, p. 777 *ante*.) The stump was dressed with strips of muslin saturated with cold water, and compress and roller used. December 6th, patient comfortable. December 28th, stump looks well; health good; patient complains of pain in back; ordered belladonna plaster. December 29th, transferred to Hospital No. 6." The specimen, represented in the annexed cut (FIG. 629), consists of the excised portion, and embraces two inches of the lower extremity of the humerus and the olecranon. The upper portion of the bones of the forearm and the greater portion of the shaft of the humerus, amputated in the upper third, are also preserved in the Army Medical Museum, and numbered 807 of the *Surg. Sect.* The extremities of the radius and ulna are carious and show no attempt at reparation. The humerus is necrosed to the line of section. Both specimens were contributed by the operator. The patient was discharged from service on February 5, 1863, and pensioned. He subsequently joined the Veteran Reserve Corps, and was ultimately discharged December 9, 1864. He was last paid June 4, 1875.

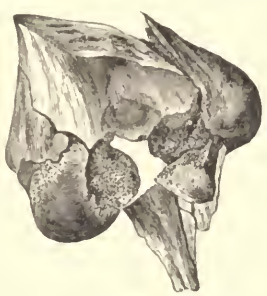

FIG. 629.—Lower extremity of the right humerus and the olecranon excised for shot fracture. *Spec.* 458.

Another instance[2] is detailed on page 791, and illustrated by FIGURE 6 of PLATE LI. Of the cases in which the arm was preserved with a high degree of usefulness, there are mentioned, in the succeeding tabular statement, at least six examples (numbered 9, 16, 65, 73, 91, 101) in addition to the instances above cited, of recovery with almost perfect control of the movements of the elbow and of the functions of the forearm and hand.[3]

[1] SMITH (T. CURTIS), *Case of Resection of the Elbow after Complete Destruction of the Principal Artery, Veins, and Nerves*, in *Cincinnati Lancet and Observer*, 1871, Vol. XIV, p. 65. Thomas Lloyd, aged 22, wounded by small shot, October 6, 1870, the muzzle of the fowling-piece being but four inches from the inner border of the left elbow. The ulna was shattered, the trochlear surface of the humerus laid bare, the humero-radial articulation torn apart, and a portion of the head broken off, the soft tissues dreadfully lacerated; wadding, shot, and bone splinters were driven into the tissues in all directions, the ulnar nerve evidently divided, the brachial artery torn off at its bifurcation, and enough of the radial and ulnar arteries were missing to include the origin of the recurrent and interosseous; the median nerve and vein were also divided. On October 7th, with the assistance of Dr. A. C. Barlow, of Pomeroy, Dr. Smith resected the joint, removing the ulna two inches below the olecranon, and the articular ends of the humerus and radius, with splinters and devitalized portions of muscular tissue. The wound healed without any drawback save an exfoliation from the ulna. On December 28, 1870, the man was in "excellent general health, with free use of shoulder joint, partial and improving use of wrist joint, with ability to flex and extend the thumb and fingers, and little atrophy of the muscles of the forearm . . . the limb so completely saved as to be of great utility to its possessor"!

[2] The case of Pt. Sehe, an intermediary excision at the elbow, by Assistant Surgeon P. S. Conner, U. S. A., detailed as CASE 1709, on p. 791, and included in the summaries of TABLE XC, No. 5, and TABLE CIX, No. 104, p. 878.

[3] My note-books furnish the following references to published abstracts of cases of intermediary excisions at the elbow for the effects of shot injury practised during the civil war: STEARNS (J., jr.), *A few cases of Excision of Elbow*, etc., in *Boston Med. and Surg. Jour.*, 1863, Vol. LXVIII, p. 251 *et seq.* GILFILLAN (W.), *Excision of the Elbow Joint*, etc., in *Trans. of Med. Soc. of New York*, 1866, p. 125. GROSS (S. TABLE CX.

Summary of One Hundred and Twenty-seven Cases of Recovery after Intermediary Excisions of the Bones at the Elbow, for Shot Injury.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Albin, J. E., Pt., C, 12th New York, age 24.	July 1, 1862.	Wound of forearm by conoidal ball.	July 9, 1862.	Partial excision of elbow joint.	Complete anchylosis of elbow; not a pensioner.
2	Andreas, G., Pt., B, 39th New York, age 43.	Oct. 14, 1863.	Compound comminuted fracture of left radius and upper third of ulna by conoidal ball.	Oct. 18, 1863.	Excision of head of radius and upper third of ulna, by Surg. E. Bentley, U. S. V.	Disch'd April 19, 1864; not a pensioner. Complete recovery except partial anchylosis.
3	Barlow, A. R., Corp'l, G, 157th New York, age 23.	Dec. 6, 1864.	Fracture of olecranon process of left ulna by conoidal ball.	Dec. 13, 1864.	Olecranon and one inch of shaft of ulna, by A. A. Surg. W. Balser.	Caries of ulna; complete anchylosis of elbow joint. Disch'd June 12, 1865; pensioned.
4	Binnings, J. R., Pt., K, 97th New York, age 22.	May 6, 1864.	Wound of left elbow joint by a conoidal ball.	May 27, 1864.	Excision of four inches of ulna, by Asst. Surg. A. Delaney, U. S. V.	Duty Nov. 23, 1864; pensioned. Complete anchylosis; persistent neuralgia.
5	Bivans, R., Pt., E, 115th Illinois, age 20.	Sept. 20, 1863.	Wound through right elbow, fracturing ulna and inner condyle of humerus, by conoidal ball.	Sept. 26, 1863.	Portion of right ulna and inner condyle of humerus excised, by Surg. W. Varian, U. S. V.	Inflammation of lung with formation of abscesses; paracentesis. Disch'd March 23, 1865; pensioned. Anchylosis of elbow.
6	Bixler, B. R., Pt., F, 80th Indiana, age 23.	Oct. 8, 1862.	Right elbow joint opened, and upper end of ulna commin'd, by a conoidal ball.	October, 1862.	Head and two inches of radius, and two and a half inches of ulna, L-shaped incision, by A. A. Surg. J. Sloan.	Disch'd Jan. 6, 1863; pensioned. Complete anchylosis; arm semi-flexed. *Spec.* 341.
7	Bosz, J., Pt., D, 187th New York, age 39.	Oct. 27, 1864.	Shot compound comminuted fracture of upper third of left ulna and olecranon process.	Nov. 3, 1864.	Three inches of ulna and olecranon, by Surg. O. A. Judson, U. S. V.	Disch'd May 19, 1865; pensioned. No bony union; forearm dangles in every direction.
8	Bragg, L., Pt., H, 3d Maine, age 28.	May 10, 1864.	Conoidal ball entered left elbow joint, fracturing lower part of humerus.	May 28, 1864.	Excision of left elbow joint, by Surg. R. B. Bontecou, U. S. V.	Disch'd July 27, 1865; pensioned. Humerus shortened four inches; arm useless.
9	Brewer, W. H., Pt., C, 73d Indiana, age 28.	Mar. 21, 1865.	Left humerus comminuted just above condyles by shot; elbow involved.	Mar. 25, 1865.	Excision of condyles of humerus, by Surg. S. D. Turney, U. S. V.	Full motion of hand; no motion in joint. Disch'd June 18, 1865. Almost entirely recovered.
10	Brooks, W., Corp'l, H, 68th Pennsylvania, age 21.	May 3, 1863.	Buckshot lodged in olecranon process of right ulna.	May 13, 1863.	Excision of olecranon process, by Surg. O. A. Judson, U. S. V.	Partial anchylosis of joint. Discharged August 13, 1863; pensioned. *Spec.* 1214.
11	Brown, J., Pt., K, 93d Pennsylvania, age 47.	May 3, 1863.	Comminuted fracture of right elbow, injuring the ulna.	May 10, 1863.	Excision of upper third of ulna.	Disch'd Feb. 5, 1864; pensioned. Anchylosis of elbow joint at an angle of 120°; no rotation of radius.
12	Buley, J., Pt., G, 2d Vermont, age 20.	May 5, 1864.	Fracture of inner condyle of right humerus and olecranon process of ulna by a conoidal ball.	May 25, 1864.	Two inches of humerus and upper part of olecranon, by A. A. Surg. F. G. Bradford.	Arm anchylosed, shortened one and three-fourths inches, atrophied, and flexed; good use of hand. Disch'd Aug. 21, 1864; pensioned. *Spec.* 2502.
13	Burns, J., Serg't, K, 19th Massachusetts, age 23.	May 12, 1864.	Fracture of upper part of right ulna and dislocation of radius by a conoidal ball; parts unhealthy.	May 21, 1864.	One and a half inches of radius of ulna, by A. A. Surg. G. H. Dare.	To V. R. C. May 6, 1865; pens'd. Anchylosis of joint; no rotation of forearm; caries of both bones; large fistulæ. Died July 11, 1871.
14	Cameron, T., Pt., K, 59th New York, age 48.	Sept. 17, 1862.	Conoidal ball comminuted the inner condyle of left humerus and olecranon process.	Oct. 4, 1862.	Excision of inner condyle and olecranon process, by Surg. H. S. Hewit, U. S. V.	Anchylosis of elbow; forearm at right angle. Disch'd July 18, 1865; pensioned.
15	Campbell, J., Pt., A, 62d Pennsylvania, age 25.	July 1, 1862.	Fracture of right elbow, radius split below tubercle, and outer condyle of humerus shattered.	July 14, 1862.	H-shaped incision.....	Copious hæmorrhage July 21, arm amputated. Disch'd Aug. 29, 1862; pens'd. Re-amputation. Died June 4, 1873. *Spec.* 15.
16	*Church, J. W.*, Pt., B, 48th Virginia, age 18.	July 1, 1863.	Musket ball chipped off a small portion of articular cartilage of humerus and comminuted radius and ulna.	July 11, 1863.	Excision of three-fourths of an inch of end of humerus, one of radius, and two of ulna, by A. Surg. R. F. Weir, U. S. A.	Motion of elbow; by steadying humerus hand can be moved in an arc of fourteen inches. Escaped May 2, 1864. *Spec.* 3918.
17	Clark, G., Pt., H, 5th Vermont, age 35.	June 29, 1862.	Right elbow joint opened and the olecranon process of ulna comminuted by a ball.	July 17, 1862.	Head of radius and entire articular surfaces of humerus and ulna, through an H-shaped incision, by A. A. Surg. S. Teats.	Imperfect false joint; two and a half inches shortening; cannot raise anything except perpendicularly. Disch'd Dec. 26, 1862; pensioned. *Spec.* 1005.
18	Clarke, J., Pt., H, 50th Illinois, age 32.	Mar. 21, 1865.	Fracture of right elbow joint by a conoidal ball.	Mar. 31, 1865.	Resection of olecranon and three inches of shaft of ulna, by Surg. W. R. Marse, 2d Iowa.	Disch'd Aug. 1, 1865; pensioned. Complete anchylosis of joint; a little better than no arm.
19	Cook, J., Capt., F, 91st New York, age 62.	May 27, 1863.	Comminuted fracture of right humerus at lower third by a musket ball.	May 31, 1863.	Excision of two and a half inches of lower third of humerus, involving joint.	No union. Disch'd June 22, 1864; pensioned. Forearm a useless appendage. *Spec.* 2630.
20	Costello, M., Pt., B, 10th Ohio.	Oct. 8, 1862.	Comminuted fracture of upper third of left ulna.	Intermediary	Olecranon process and about two inches shaft of ulna, thro' straight incision, by A. A. Surg. M. N. Elred.	Disch'd Jan. 9, 1863; pensioned. Complete anchylosis; forearm and hand atrophied; partial digital paralysis. *Spec.* 337.
21	Curtis, L. H., Pt., E, 1st Michigan Engineers, age 21.	Aug. 17, 1864.	Fracture of left radius by a conical ball.	Aug. 28, 1864.	Excision of head of radius.....	Disch'd Feb. 7, 1865; pensioned. Perfect anchylosis; arm nearly useless.
22	Davis, J. W., Pt., B, 36th Illinois, age 23.	Dec. 31, 1862.	Musket ball struck olecranon process of right ulna, comminuting the bones of elbow and opening the joint.	Jan. 12, 1863.	Excision of ends of humerus, radius, and ulna, by A. A. Surg. M. H. Lyman.	Disch'd April 18, 1863; pens'd. Joint stiff; forearm shortened four inches; arm useless.
23	*Davis, J. W.*, Pt., H, 3d Georgia, age 26.	Feb. 6, 1865.	Fracture at upper third of right ulna by a conoidal ball.	Feb. 10, 1865.	Two and a half inches end of ulna, by Asst. Surg. W. L. Baylor, C. S. A.	In April, 1865, was "nearly well."
24	Davis, T., Pt., D, 62d Pennsylvania, age 35.	May 5, 1864.	Fracture of head of left ulna by a copper explosive ball, which penetrated the joint.	May 25, 1864.	Excision of heads of ulna and radius, by Surg. G. L. Pancoast, U. S. V.	Disch'd July 13, 1864; pens'd. Complete anchylosis at right angle; forearm wasted, useless.
25	Dillman, H. C., Pt., F, 48th Pennsylvania age 20.	June 3, 1864.	Elbow joint opened and bones fractured by a conoidal ball.	June 26, 1864.	Left elbow excised through a three-inch incision, by Surg. H. Palmer, U. S. V.	Disch'd May 15, 1865; pensioned. Complete anchylosis of joint; grasping power perfect.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
26	Dixon, P. A., Pt., A. 1st Potomac Home Brigade (Maryland), age 18.	July 24, 1864.	Fracture of inner condyle of left humerus by conoidal ball; (also wound of shoulder and ear.)	July 29, 1864.	One and a half inches of left humerus and olecranon process of ulna, thro' a straight incision, by Asst. Surg. R. F. Weir, U. S. A.	Necrosed bone removed. Disch'd June 17, 1865; pensioned. Anchylosis of elbow and wrist joints; two sinuses communicating with exfoliating bone. *Spec.* 3948.
27	Dorran, D., Pt., C, 14th New York Cavalry, age 23.	Feb. 26, 1864.	Conoidal ball entered posteriorly just above the left elbow joint, and emerged at middle of forearm anteriorly.	March 5, 1864.	Excision of bones composing joint, about four inches of bones of forearm, by Surg. C. F. Sanger, U. S. V.	Disch'd May 3, 1864; pensioned. June, wound still open, discharging spiculæ of bone; arm useless.
28	Douglass, J. D., Pt., G, 63d Pennsylvania, age 19.	Dec. 13, 1862.	Minié ball shattered the neck of left radius, parts of coronoid, olecranon, and trochlea.	Jan. 12, 1863.	Excision of extremities of ulna, radius, and humerus, by Asst. Surg. W. H. Gardner, U. S. A.	Disch'd Dec. 26, 1863; pensioned. Arm and hand useless; anchylosis of elbow; atrophy of hand, arm, and shoulder. *Spec.* 925.
29	Doyle, P., Pt., D, 69th New York.	Sept. 17, 1862.	Fracture of right elbow joint by a conoidal ball.	Oct. 2, 1862.	Excision of two inches of lower extremity of humerus and olecranon, by Surg. H. S. Hewit, U. S. V.	Arm amputated at upper third December 4, 1862. To Veteran Reserve Corps Dec. 29, 1862; pensioned. *Specs.* 458 and 807.
30	Doyle, R. N., Capt., H, 8th Michigan.	June 16, 1862.	Articulating surfaces of left elbow joint shattered by conical ball.	July 1, 1862.	Articulating surfaces of humerus, radius, and ulna, through straight incision, by A. A. Surg. W. K. Cleveland.	Bony anchylosis of joint; fragments of necrosed bone removed. Discharged July 30, 1865; pensioned.
31	Durivage, E., Pt, A, 1st Vermont Cavalry, age 20.	June 15, 1864.	Lower end of right humerus and head of radius fractured by conoidal ball.	June 21, 1864.	Excision of end of humerus and head of radius, by A. A. Surg. S. Colonsdian.	Disch'd April 3, 1865; pensioned. Partial anchylosis; artificial joint; arm useless.
32	Dwyer, M., Pt., C, 160th New York, age 28.	Sept. 19, 1864.	Fracture of right olecranon process and dislocation upward of radius.	Sept. 30, 1864.	External condyle of humerus and olecranon process by A. A. Surg. J. C. Schumer.	Arm amputated at middle third October 15, 1864. Disch'd July 6, 1865; pensioned. *Spec.* 1958.
33	Edwards, O., Pt., A, 69th Indiana, age 21.	Aug. 30, 1862.	Fracture of left elbow joint by conoidal ball.	Sept. 20, 1862.	Excision of heads of radius and ulna.	Disch'd June 17, 1863; pensioned. Complete anchylosis; forearm semi-flexed; wrist bent; necrosis of radius; nearly useless.
34	Everett, C. W., Serg't, H, 49th Ohio, age 18.	Dec. 31, 1862.	Fracture of head of left radius and extremity of ulna by conoidal ball.	Jan. 6, 1863.	Fractured portions of radius and ulna excised.	Arm amputated Feb. 6. Disch'd April 14, 1863; pensioned.
35	Fisher, A., Pt., G, 55th Pennsylvania, age 21.	May 13, 1864.	Round musket ball entered three inches below right elbow, passed through joint.	May 27, 1864.	Ends of humerus, olecranon, and radius, by A. A. Surg. W. W. Bidlack.	Favorable anchylosis. Disch'd Dec. 12, 1864; pensioned. Complete anchylosis.
36	Fisher, N., Pt., H, 6th Infantry.	May 3, 1863.	Gunshot fracture of elbow of right arm.	May 31, 1863.	Excision, by Asst. Surg. B. Howard, U. S. A.	Bone ununited. Disch'd Aug. 12, 1863; pensioned. Tolerable use of arm.
37	Fox, A. B., Pt., G, 157th New York, age 20.	May 2, 1863.	Gunshot fracture of right elbow.	May 17, 1863.	Excision of olecranon process of ulna.	Permanent anchylosis. Disch'd December 19, 1863. Power of rotation lost; atrophy.
38	Frye, D. M., Pt., D, 12th Massachusetts, age 18.	Sept. 17, 1862.	Compound comminuted fracture of left ulna, ball emerging at elbow joint.	Sept. 23, 1862.	Excision of two and a half inches of upper third of ulna at elbow joint.	Anchylosis; forearm at right angle with arm: pronation limited; fingers stiff. Disch'd March 6, 1863; pensioned; atrophy.
39	Gaston, S. S., Pt., K, 100th Pennsylvania.	Aug. 29, 1862.	Fracture of upper third of left radius with incomplete fracture of its head.	Sept. 26, 1862.	Excision of two and a half inches upper third of radius, including head, by A. A. Surg. W. F. Atlee.	Erysipelatous inflammation; amputation of arm at middle third Nov. 11, 1862. Disch'd Jan. 27, 1863; pensioned. *Spec.* 1868.
40	Gove, C. H., Pt., I, 145th New York, age 17.	May 3, 1863.	Ball entered posterior aspect of forearm above its middle and exit through olecranon.	May 8, 1863.	Excision of right olecranon process.	Anchylosis of elbow joint. Discharged Nov. 21, 1863; pens'd. Arm useless.
41	Grady, M., Pt., D, 37th New York, age 20.	May 5, 1862.	Compound comminuted fracture of left elbow.	May 17, 1862.	Olecranon, and ends of radius and humerus, by Surg. R. B. Bontecou, U. S. V.	Disch'd Aug. 29, 1862; pens'd. Forearm a dead weight; hand atrop'd, paralysed; carious bone. Died Aug. 3, 1866, of cholera.
42	Graisberry, J., Pt., D, 6th New Jersey, age 24.	Aug. 29, 1862.	Conoidal ball comminuted olecranon process of right ulna; articular surfaces carious.	Sept. 20, 1862.	Condyles of humerus, head of radius, and end of ulna, thro' a T-shaped incision, by Asst. Surg. B. A. Clements, U. S. A.	Pieces of dead bone came away; typhoid fever. Disch'd Feb. 18, 1863. Joint anchylosed; slight flexion in fingers. *Spec.* 327.
43	Green, E. C., Corp'l, C, 44th New York, age 20.	May 5, 1864.	Gunshot fracture of left elbow joint; olecranon process comminuted.	May 20, 1864.	Partial excision of elbow joint, removing fragments, by A. A. Surg. J. Neff.	Disch'd April 9, 1865; pensioned. Complete anchylosis; arm atrophied to shoulder.
44	Griffin, C. J., Corp'l, B, 82d New York, age 22.	Sept. 17, 1862.	Gunshot fracture of olecranon process of left ulna.	Oct. 13, 1862.	Resection of upper third of left ulna.	Anchylosed. Disch'd Feb. 24, '63; pens'd. Arm somewhat atrophied, flexed, and weakened.
45	Haber, C., Pt., C, 123d Pennsylvania, age 19.	Dec. 13, 1862.	Gunshot fracture of head of right radius and external condyle of humerus.	Dec. 29, 1862.	Head of radius and external condyle of humerus, by Surg. O. A. Judson, U. S. V.	Duty May 7, 1863. Disch'd May 13; pens'd. Anchylosis of joint at right angles. *Spec.* 639.
46	Haines, R. H., Pt., 4th Indiana Battery, age 21.	Dec. 31, 1862.	Shot fracture of upper end of right ulna; a piece driven into elbow joint.	Jan. 25, 1863.	Olecranon process and three inches end of shaft of ulna excised thro' straight incision, by Surg. A. Ewing, 13th Mich.	Useful arm. Disch'd March 30, 1863; pens'd. Anchylosis of joint at right angles; the arm is an encumbrance from elbow down.
47	*Harris, J.*, Pt., D, 2d North Carolina, age 36.	July 3, 1863.	External condyle of right humerus fractured by conoidal ball.	July 29, 1863.	Excision of upper half of olecranon and three inches end of humerus through straight incision, by Asst. Surg. R. F. Weir, U. S. A.	Necrosis; removal of fragments; motion of joint limited. For exchange May 5, 1864. *Specs.* 2570 and 3912.
48	Hastings, J., Pt., K, 19th Indiana, age 21.	Sept. 17, 1862.	Gunshot wound of left elbow joint, badly shattering upper end of ulna.	Sept. 28, 1862.	Olecranon and coronoid processes, two and a half inches of ulna, head and one inch of radius, thro' a linear incision, by A. A. Surg. J. H. Bartholf.	Disch'd Feb. 7, 1863; pensioned. Joint anchylosed at nearly right angle; two-inch shortening; muscles atrophied; arm useless. *Spec.* 749.
49	Haverly, C. R., Pt., K, 10th Missouri, age 33.	May 14, 1863.	Elbow joint opened, and external condyle of left humerus and head of ulna fractured, by a conoidal ball.	June 10, 1863.	External condyle and upper part of ulna excised thro' an H-shaped incision, by Surg. B. A. Vanderkieft, U. S. V.	Slight motion of elbow joint. Duty Sept. 7, 1863. Disch'd Nov. 20; pens'd. Complete anchylosis; atrophy; hand numb.
50	Heinbach, W. B., Pt., G, 116th Pennsylvania, age 19.	May 12, 1864.	Wound of right elbow by conoidal ball.	May 20, 1864.	Head and four inches of shaft of ulna, by Asst. Surg. J. C. McKee, U. S. A.	Deserted July 28, 1864. Claim for pension pending.
51	Henson, B., Pt., K, 22d Colored Troops, age 24.	June 15, 1864.	Condyles of left humerus and upper ends of radius and ulna injured by shell.	July 9, 1864.	Excision of elbow joint thro' semi-lunar incision, by Asst. Surg. J. H. Frantz, U. S. A.	Disch'd April 1, 1865; pensioned. No bony union; arm useless.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
52	Herritage, W. H., Pt., I, 138th Pennsylvania, age 21.	June 1, 1864.	Wound of left elbow joint by conoidal ball; exterior condyle of humerus detached; necrosis.	June 21, 1864.	Excision of external condyle of humerus through vertical incision, by A. A. Surg. W. B. Corbit.	To V. R. C. Jan. 18, 1865; pens'd. Joint anchylosed at an angle of 45°; grasp good; muscles well developed; rotation impossible.
53	Hertzog, J. F., Pt., K, 47th Pennsylvania, age 29.	Oct. 22, 1862.	Ball entered the outer condyle and emerged just above the inner condyle of right humerus.	Oct. 26, 1862.	Excision of three inches lower end of humerus and articular ends of radius and ulna thro' an H-shaped incision, by Surg. R. B. Bontecou, U. S. V.	Good motion in elbow; arm shortened three and a half inches. Disch'd February 24, 1863; pensioned. The arm "hangs dangling by his side and is useless." *Spec.* 2023.
54	Hilsdon, E., Pt., D, 155th Pennsylvania, age 26.	May 10, 1864.	Compound fracture of upper part of right radius, involving elbow joint, by a conoidal ball.	May 15, 1864.	Excision of three inches upper part of radius, by Surg. C. Page, U. S. A.	Anchylosis of elbow joint and partial loss of use of arm. Discharged May 24, '65; pensioned.
55	Hinchman, J., Pt., E, 12th New Jersey, age 22.	May 3, 1863.	Fracture of head and about two inches of shaft of left ulna by conoidal ball, which lodged in arm and was extracted on the field.	May 25, 1863.	Excision of three inches upper end of ulna, including olecranon, through a straight incision.	Partial use. Disch'd October 22, 1863; pensioned. Anchylosis at angle of 35°; loss of pronation and supination; arm useless for manual labor. *Spec.* 1209.
56	Hobart, J., Pt., F, 112th New York, age 21.	June 1, 1864.	Shot fracture of condyles and lower four inches of left humerus, extending into joint.	June 9, 1864.	The olecranon, part of coronoid process, upper three inches of radius, and condyles of humerus excised, by Surg. D. P. Smith, U. S. V.	Disch'd Nov. 16, 1864; pensioned. Anchylosis at nearly a right angle. March, 1867, bones became diseased; discharge continuous. *Spec.* 3298.
57	Hoffnagle, M. H., Pt., G, 153d New York, age 22.	Nov. 7, 1864.	Fracture of right humerus, involving elbow joint, by a conoidal ball.	Nov. 22, 1864.	Two inches of humerus and olecranon process of ulna by straight incision, by Asst. Surg. R. F. Weir, U. S. A.	Disch'd May 16, 1865; pensioned. Partial flexion and extension but no rotation; muscles atrophied; almost constant discharge kept up by necrosed bone.
58	Holbert, M. T., Pt., B, 124th New York, age 27.	May 3, 1863.	Fracture of condyles of right humerus by musket ball.	May 9, 1863.	Excision of lower four inches of humerus through linear incision, by Surg. T. Antisell, U. S. V.	Disch'd Oct. 18, 1863; pens'd. No bony union; complete mobility of joint; full use of hand with forearm supported.
59	Hollister, O. H., Corp'l, I, 10th Penn. Reserves.	June 27, 1862.	Wound of left elbow joint.....	July 21, 1862.	Excision of joint, by A. A. Surg. J. O. French.	Amputation of arm. Disch'd Sept. 12, 1862; pensioned.
60	Hotchkiss, D. H., Pt., G, 45th Pennsylvania, age 21.	May 5, 1864.	Ball entered left forearm one inch from joint, fracturing both radius and ulna.	May 25, 1864.	Ends of humerus, radius, and ulna excised, by Surg. R. B. Bontecou, U. S. V.	Disch'd Sept. 5, 1865; pensioned. Complete anchylosis; limb straight.
61	Howe, E., Pt., A, 6th Vermont, age 21.	May 5, 1864.	Wound of right elbow, compound comminuted fracture of ulna, by a conoidal ball.	May 23, 1864.	Excision of two and three-fourths inches of upper extremity of ulna, by A. A. Surg. H. A. Armstrong.	Disch'd Jan. 15, 1865; pensioned. Partial anchylosis; slight use of hand; useless for manual labor. *Spec.* 2304.
62	Johnson, F., Pt., H, 118th New York, age 22.	Oct. 27, 1864.	Fracture of external condyle of right humerus and opening of joint by conoidal ball.	Nov. 26, 1864.	Both condyles of humerus and olecranon process of ulna excised, by A. A. Surg. C. C. Ela.	Disch'd May 27, 1865; pensioned. With exception of pronation and supination the motions of arm are nearly perfect.
63	Johnston, D., Serg't, K, 6th Ohio Cavalry, age 24.	May 9, 1864.	Wound of left arm, implicating elbow joint, by a musket ball.	June 8, 1864.	One and a half inches of radius and ulna excised through longitudinal incision, by A. A. Surg. T. Liebold.	To V. R. C. April 12, '65. Disch'd Aug. 24; pens'd. Complete anchylosis; forearm in nearly extended position; atrophy.
64	Jordo, C., Pt., A, 16th Michigan, age 39.	June 27, 1862.	Fracture of inner condyle of left humerus, involving elbow joint.	July, 1862.	Excision of inner condyle of humerus.	Sloughing; hæm.; amp. July 29, 1862. Disch'd Sept. 7, 1863; pens'd. Died Jan. 6, 1869, of hæm'go from lungs. *Spec.* 433.
65	Kelly, M., Capt., C, 182d New York.	Jan. 30, 1863.	Fracture of olecranon process of ulna, opening elbow joint, by a piece of shell.	Feb. 14, 1863.	Olecranon, articular surface of humerus, and radius, ⌊ incision, by Dr. Gilfillan.	All motions of elbow complete. Disch'd March 24, 1865. Not a pensioner.
66	Killian, C., Corp'l, H, 2d Michigan, age 28.	May 31, 1862.	Gunshot fracture of olecranon process of right ulna, involving elbow joint.	June 4, 1862.	Excision of olecranon process of ulna.	June 14, symptoms of pyæmia; amp. of arm July 3, 1862. Discharged August 16, 1862; pensioned.
67	Laird, H. S., Pt., I, 136th Pennsylvania, age 20.	Dec. 13, 1862.	Compound comminuted fracture of right ulna three inches below external condyle of humerus.	Intermediary	Excision of upper portion of ulna, by Asst. Surg. G. M. McGill, U. S. A.	Disch'd May 29, 1863; pensioned. Extens'n and flexion good; Nov., 1871, joint enlarged, anchylosed, out of place and crooked.
68	Leonard, J., Pt., E, 95th New York, age 22.	May 5, 1864.	Fracture of right radius by a conoidal ball entering just below elbow and lodging in limb.	May 20, 1864.	Excision of head and two and a half inches of radius thro' straight incision, by Surgeon Maynard, C. S. A.	Disch'd May 12, 1865; pensioned. Anchylosis; cannot raise hand to his mouth; motion at joint about four degrees; muscles atrophied.
69	Lewis, G. W., Musician, 2d Brigade, 3d Division, 10th Army Corps, age 17.	July 26, 1864.	Gunshot fracture of right olecranon process of ulna by a conoidal ball.	Aug. 1, 1864.	Olecranon and necrosed portion articular surface of ulna, by A. A. Surg. W. L. Welles.	Disch'd October 29, 1864. Not a pensioner.
70	Lindsey, W., Pt., M, 62d Pennsylvania, age 23.	May 8, 1864.	Olecranon comminuted and condyles of right humerus split by a conoidal ball.	May 19, 1864.	Partial excision, removing fragments, by A. A. Surg. B. B. Miles.	Gangrene; partial anchylosis. Disch'd Dec. 23, 1864; pens'd. Forearm extended; atrophy.
71	Longsmith, H., Pt., I, 125th Ohio, age 24.	Nov. 25, 1863.	Ball struck shaft of left ulna, fracturing upper end into sigmoid notch.	Nov. 29, 1863.	Resection of two inches of ulna with coronoid and olecranon processes.	Disch'd Aug. 5, 1864; pensioned. Paralysis of forearm; muscles atrophied.
72	Mathias, A. C., Corp'l, K, 65th Ohio, age 20.	May 14, 1864.	Shot wound of right elbow....	May 20, 1864.	Excision of four inches of humerus through four-inch incision, by A. Surg. C. C. Byrne, U. S. A.	Disch'd Feb. 6, 1865; pensioned. Artificial joint; ulceration of ends of humerus and ulna; constant use of a sling to support the forearm.
73	Mattix, J., Pt., D, 64th Ohio, age 22.	Sept. 19, 1863.	Fracture of both condyles of right humerus by a conoidal ball, which lodged against the eighth rib.	October, 1863.	Internal condyle of humerus sawn off; four days later the external condyle, by Surg. A. McMahon, 64th Ohio.	Disch'd May 5, 1864; pensioned. Has a good arm.
74	Mayo, J., Pt., D, 14th New Hampshire, age 42.	Oct. 19, 1864.	Right elbow joint opened and olecranon process of ulna fractured by a conoidal ball.	Nov. 5, 1864.	Excision of olecranon process of ulna thro' straight incision, by A. A. Surg. W. Staveley.	Arm subsequently amputated at lower third. Disch'd May 2, 1865; pensioned.
75	*McCauley, R. W.*, Pt., H, 56th Virginia, age 30.	July 3, 1863.	Gunshot wound of left elbow by a conoidal ball.	July 13, 1863.	Resection of elbow joint.....	Transferred April 25, 1864, to Fort Monroe for exchange.
76	McInturf, E., Serg't, I, 62d Ohio, age 27.	Aug. 16, 1864.	Fracture of olecranon process of ulna and external condyle of left humerus by a conoidal ball.	Sept. 1, 1864.	External condyle of humerus, one-half inch of radius and ulna, thro' a five-inch incision, by A. A. Surg. A. J. Smith.	Anchylosis of joint. Discharged May 23, 1865; pensioned. Arm atrophied; is unable to close the fingers.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
77	McMurphy, H., Pt., C, 5th New Hampshire, age 28.	Dec. 13, 1862.	Minié ball entered posterior aspect of left ulna two inches below the extremity of olecranon, shattering the bone, breaking off the upper end, and involving the joint.	Dec. 18, 1862.	Excision of head of radius, olecranon and coronoid processes, and portions of condyles of humerus, Mercan's method. H incision, by A. A. Surg. J. Stearns.	Disch'd Sept. 3, '63; pens'd. Arm could be extended and flexed by passive motion. In 1869 Pension Examiner reports "complete anchylosis; atrophy forearm; almost useless." *Spec.* 920.
78	Mead, J. M., Pt., D, 17th Michigan, age 19.	May 12, 1864.	Fracture of left elbow, and joint opened, by a conoidal ball.	May 16, 1864.	Excision of condyles and one inch of shaft of humerus, also two inches of radius, by A. A. Surg. F. W. Kelly.	Duty July 12, 1864; pensioned. Complete anchylosis; forearm at an angle of 60° with arm; no rotation.
79	Mendenhall, I., Corp'l, 5th Indiana Battery.	Oct. 8, 1862.	Right humerus fractured within elbow joint by a musket ball.	October, 1862.	Two inches of end of humerus, through an L-shaped incision, by A. A. Surg. J. Sloan.	Favorable. Discharged Dec. 15, 1862.
80	Meyer, J., Pt., A, 1st Battalion, 12th Infantry.	Aug. 29, 1862.	Gunshot fracture of external condyle of right humerus and the head of radius.	Sept. 7, 1862.	Portion of external condyle of humerus and head and one-half inch of shaft of radius, through an S-shaped incision, by Surg. D. W. Bliss, U. S. V.	Favorable. Discharged Nov. 15, 1862. *Spec.* 181.
81	Miller, D., Pt., A, 1st Maryland, age 18.	Feb. 6, 1865.	Fracture of right elbow by a conoidal ball.	Feb. 15, 1865.	Upper ends of radius and ulna removed, by Asst. Surg. J. Vansant, U. S. A.	Spiculæ of dead bone removed. Disch'd Oct. 7, 1865; pensioned. Joint anchylosed; limb atrophied and shortened.
82	Moore, G., Pt., B, 106th Pennsylvania.	July 3, 1863.	Shot fracture of left elbow joint.	July 12, 1863.	Excision of ends of humerus, radius, and ulna.	Duty June 22, 1864; pensioned. False joint; atrophy of muscles; use of hand, one-half.
83	Moore, J., Pt., C, 45th Pennsylvania, age 20.	June 3, 1864.	Compound comminuted fracture of right external epicondyle by a conoidal ball.	June 9, 1864.	Removal of fragments of epicondyle by slitting up track of wound, by Asst. Surg. H. Allen, U. S. A.	Disch'd Jan. 11, 1865; pensioned. Complete anchylosis of joint; arm fixed at an obtuse angle, with hand between pronation and supination.
84	Mortimore, J. L., Pt., C, 67th Pennsylvania, age 40.	Mar. 25, 1865.	Fracture of left humerus and radius.	April 5, 1865.	Excision, by Asst. Surg. H. Allen, U. S. A.	Disch'd June 29, 1865; pens'd. *Spec* 72. See CASE 1801, p. 870.
85	Moser, P., Pt., F, 47th Pennsylvania.	Oct. 22, 1862.	Fracture of head of radius and both condyles of left humerus by a musket ball.	Nov. 1, 1862.	Excision of condyles of humerus and head of radius, by A. Surg. J. E. Semple, U. S. A.	Disch'd February 24, 1863. Not a pensioner.
86	Newman, G. R., Pt., K, 61st Pennsylvania, age 34.	May 6, 1864.	Fracture of upper end of left radius and ulna and lower end of humerus; joint opened.	May 15, 1864.	Condyles of humerus, two inches of ulna, and a portion of radius, by A. A. Surg. F. W. Kelly.	Progress favorable. Disch'd Nov. 25, 1864. Not a pensioner.
87	O'Keefe, T., Serg't, F, 82d New York.	July 3, 1863.	Gunshot fracture of right ulna, opening elbow joint; olecranon destroyed.	July 29, 1863.	End of ulna and one and a half inches of radius, by A. A. Surg. I. H. B. McClellan.	Disch'd April 15, 1864, for promotion. Not a pensioner. *Spec.* 2600.
88	O'Neil, jr., E., Pt., D, 10th Ohio, age 18.	Oct. 8, 1862.	Gunshot wound of right elbow joint.	October, 1862.	Excision of condyles of humerus and portion of shaft, three inches in all, through straight incision, by A. A. Surg. J. Sloan.	Disch'd Jan. 6, 1863; pensioned. Artificial joint excellent; forearm reduced in length; action of elbow joint, forearm, and hand good, except rotation. *Spec.* 351.
89	Osgood, O. S., Corp'l, C, 15th Massachusetts, age 22.	Sept. 17, 1862.	Coronoid and olecranon processes of ulna destroyed and radius of left arm dislocated by a conoidal ball; condyles of humerus and head of radius diseased.	Oct. 15, 1862.	Condyles of humerus and articular ends of radius and ulna excised through a T-shaped incision, by Asst. Surg. J. H. Bill, U. S. A.	Elbow stiff, deformed; rotary motion nearly lost; fingers nearly numb. Disch'd Dec. 30, 1862; pens'd. Complete anchylosis of joint; forearm one-third flexed and turned inward.
90	Pattne, J., Corp'l, C, 39th New York, age 20.	May 5, 1864.	Fracture of olecranon and condyles of right humerus.	May 25, 1864.	Complete excision, by Surg. G. L. Pancoast, U. S. V.	Disch'd Nov. 7, 1865; pensioned. *Spec.* 3478. See CASE 1798, p. 869.
91	Peaslee, J. O., Pt., G, 121st New York.	July 10, 1863.	Gunshot wound of left elbow by a conoidal ball: joint opened and bones shattered.	July 18, 1863.	Articular ends of humerus, radius, and ulna removed thro' a straight incision four inches long, by Asst. Surg. W. H. Gardner, U. S. A.	Able to raise hand to mouth. To V. R. C. June 28, 1864; pens'd. Good use of forearm and hand. Died Dec. 15, 1866, of phthisis pulmonalis.
92	Phelps, F. S., Pt., D, 36th Illinois, age 24.	Sept. 19, 1863.	Gunshot fracture of head of left ulna and external condyle of humerus by a conoidal ball.	Oct. 2, 1863.	Excision (articular surfaces of humerus not removed), by Surgeon Dodd, of Wisconsin.	End of humerus exfoliated; spiculæ removed. Disch'd Nov. 6, 1864; pens'd. Forearm dangles; muscles atrophied.
93	Plimpton, O. B., Pt., G, 39th Illinois, age 25.	Aug. 8, 1864.	Gunshot wound of left elbow joint.	Aug. 31, 1864.	Inner condyle of humerus and olecranon process of ulna removed, by A. Surg. C. Wagner, U. S. A.	Disch'd Nov. 21, 1864; pensioned. Anchylosis of joint; forearm atrophied; arm nearly useless. Died October 11, 1866.
94	Ream, J. A., Pt., I, 31th Ohio, age 21.	July 18, 1863.	Gunshot fracture of left humerus at lower third, involving elbow joint, by a ball.	Aug. 10, 1863.	Excision of lower end of humerus, by a Confederate surgeon.	Duty May 16, 1864; pensioned. Ligamentous union; atrophy; loss of strength and motion.
95	Riley, P., Pt., E, 44th New York, age 34.	May 8, 1864.	Gunshot wound of left elbow joint by a conoidal ball.	May 15, 1864.	Olecranon process of ulna, thro' straight incision, by Surg. A. F. Sheldon, U. S. V.	Disch'd Oct. 11, 1864; pensioned. Complete bony anchylosis of joint.
96	Riley, W. T., Pt., D, 86th New York, age 21.	Nov. 26, 1863.	Shot perforation of right elbow.	Dec. 19, 1863.	H-shaped incision, by Surg. C. Page, U. S. A.	Disch'd Oct. 21, 1864; pensioned. *Spec.* 3026. See CASE 1797, p. 869.
97	Ripley, L. G., Pt., B, 10th Vermont, age 20.	Nov. 27, 1863.	Left elbow joint opened and inner condyle fractured by a conoidal ball.	Dec. 6, 1863.	Excision of left elbow joint, olecranon and articulating surface, and one inch of shaft of humerus, through an H incision, by Surg. D. P. Smith, U. S. V.	Arm shortened one inch; anchylosed nearly at right angle; liable to ulceration; useless for manual labor. To V. R. C. Feb. 20, 1865; pensioned.
98	Rittinghouse, Z., Pt., K, 51st Illinois, age 18.	Nov. 30, 1864.	Fracture of upper third of right radius and ulna by a conoidal ball; joint opened.	Dec. 29, 1864.	Two and a half inches of end of ulna and head of radius, through straight incision, by A. A. Surg. C. H. Fisher.	Disch'd May 25, 1865. Re-enlisted Mar. 25, 1867. Disch'd 1869; pensioned. Anchylosis; wound never healed.
99	Rodenbarger, D., Pt., E, 46th Pennsylvania, age 29.	May 2, 1863.	Ball entered outer side forearm one inch below head of left radius, and emerged at inner side of arm, two inches above, comminuting joint.	May 10, 1863.	Removal of lower four inches of humerus and upper six inches of ulna, by A. A. Surg. W. A. Harvey.	Motions of forearm imperfect. Disch'd Oct. 2, 1863; pensioned. Arm dangles by side; is useless.
100	Sands, W. P., Serg't, C, 5th Ohio, age 21.	Mar. 22, 1862.	Wound of right elbow joint by a rifle ball.	Mar. 27, 1862.	Portions of humerus, radius, and ulna, by Surg. A. D. Gall, 13th Indiana.	Disch'd June 3, 1862; pensioned. Permanent semiflexion of forearm.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
101	Schneider, M., Pt., I, 23d Ohio, age 24.	Sept. 16, 1862.	Wound through left elbow joint by a musket ball; olecranon shattered.	Oct. 8, 1862.	Olecranon entirely removed through a longitudinal incision, by Surg. S. D. Gross, U. S. V.	Recovered with useful arm, all the motions being excellent. Discharged December 15, 1862; not a pensioner.
102	Schroeder, L., Serg't, E, 12th Missouri, age 28.	Nov. 27, 1863.	Gunshot fracture of lower end of right humerus and heads of radius and ulna.	Dec. 11, 1863.	Excision of elbow joint.....	Disch'd Nov. 5, 1864; pensioned. Anchylesis of joint; arm drawn toward body at an angle of about 33°; arm and hand useless.
103	Sedille, E. D., Pt., I, 7th Infantry, age 21.	July 2, 1863.	Gunshot fracture of right radius and ulna, involving the elbow joint.	July 12, 1863.	Excision of three inches of upper end of radius.	Complete anchylosis of joint. Disch'd October 10, 1863; pensioned. A large cicatrix on anterior surface of forearm impairs use of member.
104	Sehe, J., Pt., C, 165th New York, age 40.	May 27, 1863.	Ball passed nearly transversely thro' right arm just above the elbow, comminuting humerus and involving elbow joint.	June 9, 1863.	Excision of lower three inches of humerus and articulating extremities of radius and ulna.	Secondary amputation of arm. Disch'd October 19, 1863; pensioned. *Spec.* 1309.
105	Skelton, T., Pt., A, 149th Pennsylvania, age 20.	May 6, 1864.	Conoidal ball entered at outer side of right arm, fracturing external condyle of humerus and upper end of ulna.	May 20, 1864.	Removal of two and a quarter inches of end of humerus, by A. A Surg. F. G. H. Bradford.	Disch'd Sept. 9, 1865; pensioned. Arm and hand atrophied; nearly whole extent of humerus carious; will require amputation at shoulder joint to save life. Died May 25, 1867. *Spec.* 2501.
106	Smith, L., Pt., B, 70th New York.	May 5, 1862.	Fracture of elbow joint by ball.	May 12, 1862.	Excision of entire joint, by Surg. R. B. Bontecou, U. S. V.	To Veteran Reserve Corps July 11, 1863; not a pensioner.
107	Smith, R., Pt., B, 105th Pennsylvania, age 38.	April 6, 1865.	Shot wound through left elbow joint by a conoidal ball; joint badly shattered.	April 24, 1865.	Excis'n of condyles of humerus and upper part of ulna thro' two parallel incisions, one anterior, one posterior, by Surg. B. A. Vanderkieft, U. S. V.	Gangrene. Disch'd Oct. 2, 1865; pensioned. Deformity; motion to 74°; ring and little fingers paralyzed; rotation lost. *Spec.* 102.
108	Smith, W. V., Capt., G, 7th Colored Troops, age 24.	Sept. 27, 1864.	Fracture of external condyle of right humerus by a conoidal ball. Also wound of left shoulder.	Oct. 23, 1864.	Excision of four inches of end of humerus, including condyles, by Surg. D. G. Rush, 101st Pennsylvania.	Very useful arm. Mustered out October 13, 1866; pensioned. Forearm atrophied. *Spec.* 3803.
109	Squires, S., Pt., B, 59th New York.	Sept. 17, 1862.	Round ball wound of right elbow joint, removing triangular piece of ulna, including lesser sigmoid cavity and one-third of head of radius.	Oct. 6, 1862.	Head and one inch of radius and portion of olecranon, thro' a T-shaped incision, by Asst. Surg. E. D. Breneman, U. S. A.	Disch'd Dec. 22, 1862; not a pensioner. *Spec.* 884.
110	Stacy, C., Pt., C, 1st Massachusetts Heavy Artillery, age 27.	June 19, 1864.	Compound comminuted fracture of olecranon process and upper third of left ulna by a conoidal ball.	July 1, 1864.	Two inches of ulna and olecranon, through straight incision over outer part of arm, by A. A. Surg. R. E. Price.	Favorable. Duty January 17, 1865, for muster out.
111	Stanley, T. F., Serg't, 14th Indiana Battery, age 24.	Mar. 31, 1865.	Comminuted fracture of lower end of left humerus by a conoidal ball.	April 23, 1865.	Excision of extremity of humerus and olecranon process of ulna, by Surg. J. Bockee, U. S. V.	Erysipelas. Disch'd June 20, 1865; pens'd. No joint; three inches intervene between arm and forearm; latter dangling and spinning on its axis.
112	Stark, J. H., Pt., M, 7th Indiana Cavalry, age 22.	Oct. 22, 1864.	Shot through elbow.....	Oct. 31, 1864.	Excision, by Asst. Surg. J. M. Study, U. S. V.	Disch'd May 13, 1865; pensioned. *Spec.* 3606. See CASE 1796, p. 868.
113	Stephens, J. H., Pt., F, 10th Indiana, age 19.	Sept. 19, 1863.	Wound of left elbow; olecranon process fractured by conoidal ball.	Sept. 26, 1863.	Excision of olecranon through straight incision.	Disch'd Sept. 19, 1864; pens'd. Complete anchylosis of joint; limb atrophied: useless.
114	Stickleman, H., Pt., K, 40th Ohio, age 19.	Sept. 20, 1863.	Gunshot fracture of inner condyle of left humerus and head of ulna; elbow erysipelatous.	Oct. 14, 1863.	Head and three inches of shaft of ulna, and portion of condyle of humerus, through straight incision, by Asst. Surg. J. E. Link, 21st Illinois.	Joint anchylosed. Disch'd Dec. 7, 1864; pensioned. Forearm at right angle; muscles atrophied.
115	Thompson, F., Pt., K, 51st Illinois.	Sept. 20, 1863.	Gunshot wound of right elbow, the ball entering below head of radius and emerging above external condyle of humerus.	Oct. 3, 1863.	The articular ends of the humerus, radius, and ulna removed through a ⊢-shaped incision, by A. A. Surg. P. Feldbausch.	Perfect use of fingers; mobility in elbow 30°. Must'd out Jan. 13, 1865; pens'd. Arm can be extended to right angle, and flexed a little; used for eating, but not for ordinary labor; atrophied.
116	Thompson, J. W., Pt., C, 23d Pennsylvania, age 25.	June 1, 1864.	Compound comminuted fracture of left humerus, involving elbow joint, by a conoidal ball.	June 12, 1864.	Three inches lower third of humerus, including condyles, through five-inch incision, by A. A. Surg. P. Wilson.	Duty Aug. 5, 1864. Discharged Sept. 8, 1864; pensioned. Forearm hangs helpless by the side; muscles atrophied.
117	Toner, M., Pt., C, 69th Pennsylvania, age 26.	July 3, 1863.	Shot fracture of inner condyle of right humerus and olecranon process of ulna; humerus superficially necrosed.	July 21, 1863.	Three inches lower end of humerus removed, by A. Surg. C. R. Greenleaf, U. S. A.	Disch'd Sept. 26, 1864; pens'd. Ligamentous union only, leaving a useless extremity. *Spec.* 2578.
118	Tracy, T., Pt., C, 2d Infantry, age 25.	Aug. 29, 1862.	Conoidal ball passed through left elbow joint, breaking it up completely.	Sept. 12, 1862.	Excision of joint thro' a large H-shaped incision.	Disch'd Jan. 23, 1863. Small pieces of bone came away; arm wasted; joint anchylosed; pensioned. Pronation and supination lost; forearm flexed at an angle of 90°. Re-enlisted.
119	Valentine, W. H., Serg't, B, 5th Colored Troops, age 23.	Sept. 29, 1864.	Comminuted fracture of lower end of right humerus by a conoidal ball; bone split into joint.	Oct. 5, 1864.	Excision of lower third of right humerus, by A. A. Surg. T. Hopkins.	Disch'd June 24, 1865; pens'd. Complete atrophy; paralysis; no bony union; arm entirely useless.
120	Vanderhoof, G., Pt., F, 83d Pennsylvania, age 44.	May 8, 1864.	Fracture of lower four inches of right humerus by conoidal ball.	May 26, 1864.	Fractured bone excised, by Surg. D. P. Smith, U. S. V.	Disch'd Oct. 3, 1864; pensioned. Anchylosis almost complete; great deformity.
121	Walker, A., Pt., E, 41st New York, age 38.	May 2, 1863.	Fracture of right elbow joint by a conoidal ball.	May 14, 1863.	Excision of external condyle of humerus, by A. A. Surg. F. G. H. Bradford.	Disch'd Sept. 8, '63. To V. R. C.; pensioned. Complete anchylosis at an obtuse angle; arm useless for manual labor.
122	Warner, F. A., Pt., C, 7th Ohio, age 26.	Mar. 23, 1862.	Spherical ball chipped off left radius and external condyle.	April 16, 1862.	Complete excision, by Asst. Surg. R. F. Weir, U. S. A.	Disch'd July 2, 1862; pensioned. *Spec.* 838. See CASE 1793, p. 865.
123	Weaver, S. B., Pt., K, 45th Pennsylvania, age 18.	May 6, 1864.	Upper part of ulna and both condyles of right humerus fractured by a musket ball.	May 24, 1864.	Three inches upper end of ulna and part of condyles of humerus excised, by Surg. A. F. Sheldon, U. S. V.	Right arm amputated at upper third, for gangrene, July 25, '64. Mustered out July 17, 1865; pensioned. *Spec.* 2889.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
124	Welliver, J., Pt., B, 131st Pennsylvania, age 22.	Dec. 13, 1862.	Minié ball entered posterior aspect left arm, shattered olecranon, and lodged in front of inner condyle of humerus; slight comminution of articular surface of humerus.	Jan. 10, 1863.	Head of radius, ulna just below coronoid, and articular surface of humerus, thro' n longitudinal incision, by A. A. Surg. T. Liebold.	Pronation and supination to full extent. Disch'd April 10, 1863; pensioned. Bones united; motions of forearm imperfect.
125	Wells, E. L., Corp'l, I, 17th Vermont, age 17.	Sept. 30, 1864.	Fracture of left radius, ulna, and humerus at elbow joint by conoidal ball.	Oct. 7, 1864.	Excision of external condyle of humerus through straight incision, by A. A. Surg. O. P. Sweet.	An ulcer covering elbow and extending half way up arm. January, 1865, forearm anchylosed at right angles. Disch'd Aug. 11, 1865; pensioned.
126	Winterstein, J., Pt., I, 15th New York H'vy Artillery, age 21.	Mar. 31, 1865.	Fracture of condyles of right humerus and olecranon process of ulna by conoidal ball.	April 22, 1865.	Excis'n of condyles and one inch of shaft of humerus, and also olecranon process of ulna, by Surg. G. L. Pancoast, U. S. V.	Disch'd Nov. 29, 1865; pensioned. Anchylosis of joint at an angle of 45°; arm shrunk and entirely useless. *Spec.* 4389.
127	Young, T. M., Pt., I, 83d Pennsylvania, age 29.	July 1, 1862.	Ball passed laterally through left elbow joint, shattering both articulating surfaces.	July 6, 1862.	Excision of a portion of lower end of left humerus and upper ends of radius and ulna, by Asst. Surg. J. S. Billings, U. S. A.	Disch'd Sept. 2, 1862. Flexion of forearm one-sixth; rotation at elbow one-third; strong grasp; can bring hand to neck. In 1873, has to carry arm in sling; no great use.

§ *Fatal Cases of Intermediary Excision at the Elbow.*—This group comprises sixty-nine cases, a fatality of 35.2 per cent. The operations were practised upon four Confederate and sixty-five Union soldiers. Twenty-nine were on the right, and thirty-six on the left side; not reported, four. The extent of the excisions is indicated in the foot note.[1] The mortality was due to much the same proximate causes as in the series of fatal primary cases; but the proportions were different, instances of septicæmic infection and of consecutive hæmorrhage being relatively more frequent.[2] Eight of the patients had serious though not mortal wounds in other regions. Eight succumbed after submitting to consecutive amputation; the following is one of these cases:

Case 1807.—Corporal J. J. Johnson, Co. K, 48th New York, aged 26 years, was wounded at Cold Harbor June 3, 1864. He was sent to Washington, and entered Harewood Hospital. The pathological specimen (*Spec.* 3042, A. M. M.) was forwarded by the operator, Surgeon R. B. Bontecou, U. S. V., with the following minutes of the case: "Admitted June 7th, suffering from gunshot wound of the left elbow joint, the ball passing through and injuring the extremities of the humerus and radius. At the time of operation the parts were somewhat swollen; the constitutional state of the patient was not very good. Resected elbow joint, removing about half an inch of humerus, June 23, 1864. Patient did well for two days after the operation, but the parts became gangrenous and sloughing. Secondary hæmorrhage occurred on the 25th and 27th of June, the patient losing about five ounces of arterial blood each time. Amputation of the left arm, upper third, antero-posterior flap, by Acting Assistant Surgeon J. A. Bates, June 27, 1864. The patient did not improve after amputation, but rapidly sank. Died June 27, 1864, from exhaustion." The specimen consists of two and a half inches of the extremities of the left humerus, the head of the radius, and the coracoid and olecranon processes of the ulna, excised for disorganization of the elbow following gunshot. The tips of the olecranon and outer condyle were fractured by a ball passing transversely, and ulceration destroyed the articular surfaces.

In twenty instances the excised portions of bone were preserved:

Case 1808.—Corporal D. J. Davis, Co. E, 20th U. S. Sharpshooters, aged 24 years, was wounded at the Wilderness, May 6, 1864, and after treatment in a Second Corps hospital was sent to Washington, and there admitted to Finley Hospital on March 28th. Surgeon G. L. Pancoast, U. S. V., reported: "A conoidal ball entered the forearm two inches below the olecranon process of the ulna, passed upward, and emerged two inches above the external condyle of the humerus, right side. The parts were much swollen, with great suppuration about the joint. On June 3d, the patient was chloroformed and one and a half inches of the lower extremity of the right humerus and an inch of each of the bones of the forearm were removed. At the time of operation the general condition of the patient was good. Diarrhœa set in after the operation." On June 20th, hæmorrhage occurred from the brachial, and resulted in death, June 22, 1864. The operator, Acting Assistant Surgeon R. Westerling, contributed the specimen (Fig. 630). It consists of one and a half inches of the lower extremity of the humerus and half an inch of each of the bones of the forearm excised from the right elbow. The olecranon and a small fragment of the trochlea were torn off by a conoidal ball. The articular surfaces are carious.

Fig. 630.—Excised portion right elbow for caries after shot wound. *Spec.* 2483.

In the foregoing case and in Case 1811, the fatal event was due to consecutive hæmor-

[1] The articular extremities of the three bones (with more or less of their diaphyses in some cases) were excised in 13 cases; the ends of the humerus and ulna, in 9 cases; the ends of the humerus and radius, in 2 cases; the end of the humerus only, in 13 cases; the ends of the ulna and radius, in 5 cases; the upper end of the ulna alone, in 12 cases; the head of the radius, in 3 cases; excised parts unspecified, in 12 cases.

[2] The causes of death were returned as follows: pyæmia, 25 cases; erysipelas, 3; gangrene, 5; exhaustion, 12; typhoid fever, 1; secondary hæmorrhage, 12; serous apoplexy, 1; tetanus, 1; chronic diarrhœa, 2; not stated, 7.

rhage; the other four detailed cases were attended probably by purulent absorption, as revealed in an instance in which an autopsy was made, by metastatic foci in the lungs:

CASE 1809.—Corporal P. Long, Co. D, 3d New Hampshire, aged 25 years, was wounded at Bermuda Hundred, June 17, 1864, and was received from a Tenth Corps hospital into Hampton Hospital, Fort Monroe, and on the 19th was transferred to Mower Hospital, Philadelphia. Acting Assistant Surgeon J. B. Lapsley contributed the following history: "Admitted June 21, 1864, with wound of the elbow joint and fracture of the olecranon process of the ulna by a conoidal ball. Parts very much inflamed and painful at time of admission; dressed with lead water and laudanum. July 6th, forearm and hand very much swollen. Acting Assistant Surgeon W. P. Moon saw the case, gave chloroform, and examined the joint thoroughly, finding a slight fracture of the olecranon. The joint being seriously involved, the ends of all the bones being denuded, a free incision was made to relieve the inflamed parts. Acting Assistant Surgeon T. G. Morton saw the case and recommended excision, which was performed July 12th, by Dr. Moon. About an inch of the radius, one and a half inches of the ulna, the external condyle, and a portion of the internal were removed. A pasteboard splint was applied to the front of the arm, dry dressings to the wound, stimulants and nourishing diet. July 14th, patient has pain in the chest and cough. July 19th, wound doing well; patient very feeble; coughing hard. July 30th, large abscess opened on left buttock, discharging a great amount of pus. August 3, 1864, patient died at four and a half o'clock A. M. from exhaustion, the wound remaining healthy." The specimen is thus described in the Museum Catalogue: "The lower extremity of the right humerus, one inch of the radius, and one and a half inches of the ulna excised for fracture of the olecranon. The articular surfaces are all carious. The line of section in the humerus is very oblique." Acting Assistant Surgeon J. B. Lapsley contributed to the Museum the excised parts of the articulation, which are represented in the accompanying wood-cut (FIG. 631).

FIG. 631.—Excised bones of right elbow joint.—*Spec.* 3615.

CASE 1810.—Private J. S. West, Co. A, 5th Maryland, was wounded at Antietam, September 17, 1862, a musket ball passing from before backward through the right elbow, destroying the olecranon and trochlear portion of the humerus. He was treated at the field hospitals for four days, and then was sent to Hospital No. 5, Frederick. Surgeon H. S. Hewit, U. S. V., operated a fortnight after the reception of the injury, making a total excision of the articular ends of the three bones through an H-shaped incision, and contributed the specimen (FIG. 632), with the following history: "Admitted September 22d, with compound comminuted fracture of the right elbow by a minié ball. Operation, exsection of joint and two inches of the humerus, on October 3d. October 12th, up to this time the patient is doing well. October 14th, irritative fever set in, and the patient is reported as sinking rapidly. Died October 20th, at one o'clock A. M." The specimen consists of the head of the radius, extremity of the ulna, and two inches of the extremity of the humerus excised from the right elbow for direct perforation by a conoidal ball. The coronoid process has been carried away, and a portion of the inner condyle as well, and a vertical fissure separates the latter from the lower end of the humerus. The articular cartilages have been everywhere destroyed by ulceration, and the subjacent bones are rough and worn.

FIG. 632.—Excised elbow. *Spec.* 435.

CASE 1811.—Private C. Zimmer, Co. M, 7th New York Heavy Artillery, aged 20 years, was wounded in the right elbow at Cold Harbor, June 3, 1864, and was sent from a hospital of the 1st division, Second Corps, to Washington, and admitted to Finley Hospital on June 8th. Surgeon G. L. Pancoast, U. S. V., who excised the joint, contributed the specimen (FIG. 633), and reported the following account of the operation: "The ball entered the anterior surface of the joint and passed directly through it, carrying away the coronoid process and adjacent parts of the ulna. Resection was performed on June 16th, under chloroform, the injured parts at the time being in good condition, not much swollen, and not suppurating. The patient's pulse was good, but intermittent fever set in after the operation. Cold-water dressings were applied. The progress of the case was unsatisfactory, and the patient suffered much pain. Hæmorrhage from the brachial artery, to the amount of twenty ounces, occurred on June 24th. Death resulted, from the effects of hæmorrhage, on June 24, 1864." The specimen consists of the head and one inch of the shaft of the radius, the tip of the olecranon, and two inches of the lower extremity of the humerus. The articular surfaces are denuded and eroded, patches of the encrusting cartilage remaining here and there. The tip of the olecranon remains in the fossa and does not show in the cut.

FIG. 633.—Excised portion of the right elbow joint. *Spec.* 2582.

CASE 1812.—Private J. K. Moyer, Co. H, 138th Pennsylvania, aged 25 years, was wounded at the Wilderness, May 7, 1864, and admitted to Carver Hospital, Washington, four days afterward. Surgeon O. A. Judson, U. S. V., reported: "The ball entered the left elbow joint from without inward, fracturing the lower third of the humerus; the ulna and radius were not involved. At date of admission, the constitutional state of the patient was good, and there was no emaciation; the injured parts were in tolerable condition, and not greatly swollen, nor complicated with œdema of forearm or hand. May 13th, the patient being anæsthetized, a T-shaped incision was made over the elbow joint, extending up the arm, and the condyles and about two inches of the lower third of the shaft of the humerus were removed by the chain saw by Assistant Surgeon H. Allen, U. S. A. Water dressings were used and a posterior rectangular splint applied. May 23d, the patient continued to improve slowly up to this date. The wound has secreted a large amount of pus, which has reduced the patient somewhat. To-day he had a severe chill, followed by other pyæmic symptoms; appetite capricious; obstinate vomiting. Ordered spiritus vini gallici ten ounces, to be taken during twenty-four hours. May 30th, the symptoms last noted have continued and gradually increased in severity. Chills at regular intervals. Has a decided icteric tinge. Prescribed two quinine pills, to be taken every three hours. The stimulant and tonic treatment has been continued. The patient died this evening—May 30, 1864." The specimen, represented in the annexed cut (FIG. 634), is the excised portion of the lower extremity of the humerus. It was contributed by the operator.

FIG. 634.—Lower extremity of left humerus excised for shot injury. *Spec.* 2293.

Details of the morbid appearances found after death are recorded in but few of the cases of this series. In the preceding instances, the appearances of the excised portions of bone throw some light on the pathological conditions under which the operations were practised:

CASE 1813.—Private C. Wesley, Co. G, 4th New York Heavy Artillery, aged 18, was wounded at Petersburg, June 18, 1864. He was admitted to the Artillery Brigade Hospital, Second Corps, where Surgeon H. C. Tompkins, 4th New York Artillery, recorded: "Wound of elbow by bullet; simple dressings." On June 22d, the wounded man entered Carver Hospital, Washington, where excision at the injured joint was performed by Surgeon O. A. Judson, U. S. V., who reported the following history of the case: "The patient, of good constitution, was admitted suffering from a gunshot wound of the right elbow joint, the ball entering at the olecranon process, passing downward and outward, and making its exit on the radial side of the forearm, about two inches below the point of entrance, producing compound comminuted fracture of the olecranon process and head of radius. June 24th, the parts appeared considerably swollen and intensely painful, the patient somewhat emaciated and anæmic. He was taken to the operating room and etherized, when about four inches of the ulna including the olecranon, and three inches of the radius including its head, were excised by making a T-shaped incision over the elbow joint. June 25th, patient comfortable; appetite very poor. Ordered stimulants and generous diet. June 30th, wound secretes a small quantity of laudable pus; simple dressings used. July 1st, severe chill, lasting three hours. Wound rapidly filling up with healthy granulations. Appetite continues poor. Ordered sulphate of quinine with tincture of iron. July 3d, slight chill; no febrile reaction. Has slight cough. July 7th, no more chills. Ordered Fowler's solution and syrup of iodide of iron with stimulants. July 10th, opened a diffused abscess surrounding the elbow joint; profuse discharge of dark sanious pus; almost entire loss of appetite. Stimulating applications were made to the wound. July 14th, patient complains of severe pain in left side; dulness is found on percussion in lower lobe of each lung; cough continues; expectorates a thick mucus mixed with pus. Treatment continued. July 15th, pulse 90; acute pain in left side and small of back. July 16th, extremities cold; pulse small and easily compressed. Stimulants ordered in sufficient quantities. July 17th, no pulse at wrist; involuntary watery discharges from bowels; mental aberration. Death at three o'clock A. M., on July 19, 1864. Autopsy seven hours after death: Parts *in situ* appeared normal. Posterior portion of right lung found bound down by old adhesions, posterior portion of left lung by recent adhesions; right lung slightly congested. In the lower portion of the upper lobe of the left lung an abscess was found about the size of a large walnut, containing a dark fœtid pus; the upper lobe above this point contained innumerable small abscesses, also containing pus. A few abscesses were found in the upper portion of the lower lobe, the remaining portion being congested. The right side of the heart contained a large fibrinous clot and about a half ounce of pericardial fluid of pinkish color. The liver was enlarged, congested, and pale; serous membrane easily removed. The spleen was three and a half by six inches and dark; the kidneys pale; pyramidal bodies not distinctly defined; ascending colon congested. The axillary artery contained a small washed clot. A large amount of pus was found in the cancellated structure of the lower portion of the humerus and upper portion of the radius. No pus was found in the vessels of the arm." The specimen, represented in the annexed cut (FIG. 635), exhibits the excised portions of the radius and ulna. It was contributed by the operator.

FIG. 635.—Excised portion of right ulna and radius.—*Spec.* 2278.

TABLE CXI.

Summary of Sixty-nine Unsuccessful Cases of Intermediary Excision of the Elbow Joint for Shot Injury.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Adams, A., Pt., D, 109th New York, age 18.	May 12, 1864.	Comminuted fracture of lower third of right humerus by conoidal ball; joint much swollen.	May 23, 1864.	Three and a half inches of humerus, including condyles, thro' crucial incision, by Asst. Surg. J. C. McKee, U. S. A.	Erysipelas; treatment supportive. Died June 9, 1864, of pyæmia.
2	Adams, S., Pt., I, 119th Pennsylvania, age 23.	April 2, 1865.	Fracture of left humerus, extending into elbow joint, by a conoidal ball.	April 10, 1865.	Excision of two inches of lower portion of humerus.	April 12, amputation at middle third. Died April 20, 1865, of pyæmia.
3	*Barrier*, W. L., Pt., F, 3d North Carolina Cavalry.	May 6, 1864.	Shot fracture of inner condyle of humerus and olecranon process of ulna.	May 13, 1864.	Trochlea surface of humerus, also olecranon, through H incision, by Surg. C. B. Gibson, C. S. A.	Died May 17, 1864.
4	Black, L., Pt., K, 61st New York, age 24.	May 18, 1864.	Shot fracture of head of radius and external condyle of humerus.	May 31, 1864.	Excision of right elbow joint, by A. A. Surg. D. P. Wolhuupter.	Died June 27, 1864.
5	Blaney, J. S., Musician, I, 1st Artillery, age 19.	May 19, 1864.	Fracture of lower third of left humerus by conoidal ball.	June 8, 1864.	Two and a half inches of humerus and olecranon process of ulna, six-inch straight incision, by Surg J. A. Lidell, U. S. V.	Died June 15, 1864, of phlegmonous erysipelas.
6	Brown, M. M., Corp'l, G, 17th Kentucky.	Sept. 20, 1863.	Shot wound of left elbow joint, olecranon and coronoid processes carious.	October, 1863.	Excision of olecranon process with portion of ulna, by Surg. I. Moses, U. S. V.	Died December 12, 1863. *Spec.* 2147.
7	Brown, W. H., Corp'l, I, 72d Pennsylvania.	Dec. 13, 1862.	Comminuted fracture of left humerus two inches above condyles, also trochlea and olecranon process.	December, 1862.	Excision of two inches of extremity of humerus and olecranon process.	Died December 26, 1862. *Spec.* 594.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
8	Brimer, W., Pt., I, 49th Pennsylvania, age 20.	May 10, 1864.	Compound fracture of olecranon by conoidal ball.	May 31, 1864.	Excision of right elbow joint, by Surg. H. Palmer, U. S. V.	Died September 9, 1864, of typhoid fever.
9	Butterfield, W. W., Pt., F, 25th Mass., age 19.	June 3, 1864.	Gunshot fracture of left ulna..	June 13, 1864.	Three inches upper part ulna, by Surg. A. F. Sheldon, U. S. V.	Died June 17, 1864, from exhaustion.
10	Case, W. H., Corp'l, I, 15th New Jersey, age 24.	May 11, 1864.	Shot fracture of bones of left elbow joint.	May 23, 1864.	Head of radius and articular surfaces of humerus and ulna by T method, by A. A. Surg. P. C. Gilbert.	Died June 3, 1864, of pyæmia.
11	*Chandler, S. T.*, Pt., C, 6th South Carolina.	June 1, 1862.	Conoidal ball entered external condyle of left humerus and emerged at third rib, below clavicle.	June 12, 1862.	Articulating end of humerus and olecranon process, by Surgeon R. B. Bontecou, U. S. V.; cross incision.	Secondary hæmorr'age occurred. Died June 21, 1862.
12	Chase, H. H., Corp'l, D, 26th Maine, age 31.	April 14, 1863.	Elbow joint opened and four inches of upper portion of right radius fractured by conoidal ball, which lodged.	April 20, 1863.	Head of radius and five inches of shaft, with the ball, by Asst. Surg. P. S. Conner, U. S. A.	Died August 3, 1863, of wound and diarrhœa. *Spec.* 1308.
13	Clay, H., Pt., I, 76th New York, age 20.	May 5, 1864.	Fracture of right elbow joint by conoidal ball.	May 21, 1864.	Ext. condyle of humerus and olecranon process, straight incision, by Asst. Surg. C. A. McCall, U. S. A.	Died June 9, 1864, of asthenia.
14	Clayton, G. P., Pt., B, 71st Indiana.	Aug. 30, 1862.	Gunshot fracture of the elbow joint.	Sept. 19, 1862.	Excision of head of radius and portion of ulna.	Died October 6, 1862.
15	Colgrove, S. H., Corp'l, F, 48th New York, age 33.	Feb. 20, 1864.	Shot fracture of right elbow joint by conoidal ball.	Mar. 3, 1864.	Four inches of ulna and one of radius removed, by Act. Asst. Surg. W. Balser.	Died March 16, 1864.
16	Conkling, G. W., Serg't, M, 2d Illinois Cavalry.	Jan. 25, 1864.	Shot fracture of outer condyle of right humerus.	Feb. 14, 1864.	Outer condyle and splinter of shaft of humerus, through vertical incision, by Act. Asst. Surg. S. S. Jessop.	Erysipelas supervened. Died March 5, 1864, comatose.
17	Core, T., Capt., A, 148th Pennsylvania, age 27.	May 6, 1864.	Wound of right elbow joint by conoidal ball.	May 15, 1864.	Excision of head of radius, by A. A. Surg. J. O. Stanton.	Died May 21, 1864, of pyæmia.
18	Davis, D. I., Corp'l, E, 2d U. S. Sharpshooters, age 23.	May 6, 1864.	Conoidal ball fractured right elbow.	June 3, 1864.	Excision, by Act. Asst. Surg. R. Westerling. See CASE 1808, p. 879.	Died from hæmorrhage from brachial artery, June 22, 1864. *Spec.* 2483.
19	Davis, G. E., Bugler, F, 2d New York Cavalry, age 23.	June 16, 1863.	Shot wound of left elbow joint; ball in contact with humerus.	June 21, 1863.	Excision of elbow joint, three incisions, by Surg. E. Bentley, U. S. V.	Died June 22, 1863.
20	Day, I. W., Pt., B, 128th Indiana, age 18.	March 8, 1865.	Fracture of left arm by conoidal ball; elbow implicated.	April 5, 1865.	Excision of elb. joint through ⊔ incision, by Asst. Surg. W. Webster, U. S. A.	Died May 9, 1865, of pyæmia.
21	Dickerson, N. S., Pt., C, 25th Massachusetts, age 27.	June 3, 1864.	Ball entered anteriorly above outer condyle of left humerus, emerged two inches below inner condyle, fracturing bone; two pieces removed on field.	July 2, 1864.	Excision of elbow joint, by A. A. Surg. T. H. Snow.	Gangrene; July 21, amputation of arm at middle third. Died August 7, 1864, from exhaustion.
22	Essex, A., Pt., G, 11th U. S. Infantry, age 26.	May 12, 1864.	Ball passed through the joint; head of radius and ulna protruded from the wound.	May 31, 1864.	Heads of radius and ulna, condyles of humerus, with portion of shaft, by Surg. R. B. Bontecou, U. S. V.	Died July 6, 1864, from exhaustion.
23	Eustis, W., Pt., C, 7th Wisconsin, age 23.	May 5, 1864.	Ball passed thro' elbow joint..	May 27, 1864.	Resection of joint and three inches of humerus.	Arm amputated. Died July, '64.
24	Evans, W., Pt., B, 9th Colored Troops, age 41.	Sept. 29, 1864.	Comminuted fracture of lower third of left humerus.	Oct. 5, 1864.	Five inches of end of humerus, by A. A. Surg. T. Hopkins.	Died October 12, 1864, from exhaustion.
25	Fuller, W. H., Pt., I, 8th New York Heavy Artillery, age 24.	June 3, 1864.	Fracture of right elbow joint by conoidal ball; also wound of hip and thigh.	June 13, 1864.	Three inches of radius and ulna and inner cond. of humerus, by A. Surg. A. Delaney, U. S. V.	Died July 8, 1864.
26	Garvin, T., Serg't, H, 51st New York, age 36.	May 6, 1864.	Comminuted fracture external condyle of left humerus, opening elbow joint.	May 26, 1864.	Condyle removed thro' straight incision, by Surg. O. A. Judson, U. S. V.	Died September 18, 1864, of pyæmia. *Spec.* 3271.
27	Golden, O., Pt., D, 16th Massachusetts.	Aug. 30, 1862.	Shot fracture of elbow joint...	Sept. 4, 1862.	Excision, by Asst. Surg. B. Howard, U. S. A.	Died October 4, 1862.
28	Goodman, J., Pt., E, 26th Ohio.	Sept. 20, 1863.	Shot frac. of left elbow, carrying away portion of olecranon.	Sept. 26, 1863.	Excision of olecranon process..	Also flesh wound of thigh. Died Nov. 22, 1863. *Spec.* 2135.
29	Goodwin, E., Pt., E, 21st Massachusetts.	Sept. 1, 1862.	Upper part of left ulna comminuted.	Sept. 11, 1862.	Four inches of upper extremity of left ulna.	Died Oct. 30, 1862, from wound.
30	Graham, P., Corp'l, K, 26th Ohio.	Sept. 19, 1863.	Fracture of right elbow, left radius, and right foot.	Sept. 25, 1863.	Excision of right elbow, and removal of portion of left radius two inches above the wrist.	Also Chopart's operation on foot. Died October 8, 1863.
31	Gaisler, F., Pt., B, 74th Pennsylvania.	Aug. 28, 1862.	Fracture of olecranon process left ulna and comminution of internal condyle of humerus by a musket ball.	Sept. 12, 1862.	Excision of elbow joint, by A. Surg. C. A. McCall, U. S. A.	Died September 30, 1862, of pyæmia.
32	*Hammack, J. C.*, Pt., H, 4th Virginia, age 32.	May 19, 1863.	Wound of right elbow, right leg, and abdominal muscles.	June 7, 1863.	Excision of elbow joint.....	Died June 13, 1863, of pyæmia.
33	Hillman, G., Pt., F, 6th Ohio.	Dec. 31, 1862.	Comminution right olecranon process, external condyle of humerus, and head of radius.	Jan. 9, 1863.	Excision of olecranon, part of outer condyle, and head of radius.	Died January 20, 1863.
34	Hodge, G. H., Pt., D, 57th Massachusetts, age 23.	May 6, 1864.	Comminution of condyles of humerus and heads of radius and ulna.	May 29, 1864.	Complete excision of right elbow joint, by A. A. Surg. F. G. H. Bradford.	Died June 4, 1864, from exhaustion.
35	Hungerford, G., Pt., B, 1st Colored Troops, age 49.	Oct. 27, 1864.	Right olecranon process fractured and joint opened by conoidal ball.	Oct. 31, 1864.	Excision of olecranon and removal of ball, by A. A. Surg. C. C. Ela.	Died December 18, 1864, from exhaustion.
36	Hunt, A., Pt., G, 72d New York.	Dec. 13, 1862.	Comminuted fracture of left ulna, middle third, by a conoidal ball.	Jan. 11, 1863.	Head and half of shaft of ulna, through four-inch incision, by A. Surg. C. Wagner, U. S. A.	Died January 23, 1863, of pyæmia.
37	Jackson, W. M., Pt., D, 1st Michigan Sharpshooters, age 17.	May 6, 1864.	Fracture of outer condyle of left humerus, involving ulna, by conoidal ball.	May 26, 1864.	Condyles of humerus, olecranon, and articular surface of radius removed, by Surg. D. P. Smith, U. S. V.	Died June 3, 1864. *Spec.* 3306.
38	Jay, B. F., Pt., A, 1st Louisiana, age 18.	April 24, 1864.	Musket ball fractured right ulna and end of humerus.	April 28, 1864.	Two inches of humerus and the broken fragments of the ulna, by Surg. E. F. Sanger, U. S. V.	April 29, erysipelas; amputation of arm. Died May 29, 1864.
39	Johnson, J. I., Corp'l, K, 48th New York, age 26.	June 3, 1864.	Ends of left humerus, radius, and ulna injured.	June 22, 1864.	Excision, by Surg. R. B. Bontecou, U. S. V. See CASE 1807, p. 879.	Secondary hæmorrhage and gangrene; arm amp. June 27, 1864. Died June 29, 1864. *Spec.* 3042.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Remarks.
40	Long, P., Corp'l, D, 3d New Hampshire, age 38.	June 16, 1864.	Fracture of right olecranon. . .	July 12, 1864.	Excision, by A. A. Surg. W. P. Moon. See Case 1809, p. 880.	Died August 3, 1864, from exhaustion. *Spec.* 3015.
41	Lyon, L. E., Serg't, F, 48th New York, age 22.	Feb. 20, 1864.	Fracture of right humerus, extending into elbow joint, by round musket ball.	Mar. 12, 1864.	Four and a half inches of lower portion of humerus, including condyles, excised by A. Surg. W. R. Ramsey, U. S. A.	Died June 5, 1864.
42	Madigan, T., Serg't, A, 2d Infantry.	June 27, 1862.	Ball passed through olecranon process and lodged behind it, involving joint.	July 5, 1862.	Removal of olecranon process, by Surg. R. B. Bontecou, U. S. V.	Died August 5, 1862, from exhaustion and tetanus.
43	Massie, H., Pt., H, 9th West Virginia, age 19.	July 20, 1864.	Fracture of condyles of right humerus, involving elbow joint, by conoidal ball.	July 28, 1864.	Excision of two inches of lower extremity of humerus thro' incision along radial border of arm, by Surg. J. B. Lewis, U. S. V.	Died August 20, 1864, of pyæmia. *Spec.* 4261.
44	McEvoy, W., Lieut., I, 6th U. S. Colored Troops, age 22.	Sept. 29, 1864.	Condyles of left humerus fractured by conoidal ball.	Oct. 8, 1864.	Condyles of humerus and portion of shaft, olecranon process, and two inches of radius and ulna, by A. A. Surg. W. F. Litch.	Died Nov. 9, 1864, of pyæmia.
45	McKinney, J., Pt., C, 184th Pennsylvania, age 40.	June 3, 1864.	Ball lodged between head of radius and olecranon process of ulna.	June 20, 1864.	External condyles of right humerus and head of radius, by Surg. G. L. Pancoast, U. S. V.	Died July 5, 1864.
46	Minsberger, J., Pt., I, 90th Pennsylvania, age 40.	May 6, 1864.	Gunshot fracture of left humerus, implicating elbow joint.	May 18, 1864.	Two and a half inches of humerus, including condyles and olecranon, straight incision, by Asst. Surg. G. A. Mursick, U. S. V.	Died suddenly, July 28, 1864, of serous apoplexy. *Specs.* 2912, 2913.
47	Mitchell, J. W., Pt., H, 17th Maine, age 33.	April 6, 1865.	Fracture of right ulna by conoidal ball, joint involved.	April 20, 1865.	Extremity of ulna just below coronoid process, through V incision, by Surg. B. A. Vanderkieft, U. S. V.	Died May 27, 1865, of pyæmia. *Spec.* 4102.
48	Moyer, J. K., Pt., H, 38th Pennsylvania, age 25.	May 7, 1864.	Shot wound left elbow, lower third of humerus fractured.	May 13, 1864.	Exc., by Asst. Surg. H. Allen, U. S. A. See Case 1812, p. 880.	Died May 30, 1864, of pyæmia. *Spec.* 2283.
49	O'Conner, T., Pt., K, 81st Indiana.	Sept. 19, 1863.	Shot fracture head of left ulna, opening into elbow joint.	Sept. 30, 1863.	Excision of portion of ulna. . .	Died Oct. 27, 1863, of pyæmia.
50	Randall, H. B., Pt., C, 14th Ohio.	Sept. 20, 1863.	Conoidal wound right elbow joint; shaft of humerus fractured just above condyles.	Oct. 10, 1863.	Two and a half inches of lower extremity of right humerus, by Surg. I. Moses, U. S. V.	Died Oct. 26, 1863. *Spec.* 2141.
51	Robinson, W., Pt., B, 2d Penn. Artillery, age 19.	June 17, 1864.	External condyle of humerus fractured by conoidal ball.	July 3, 1864.	Head of radius and two inches of lower end of humerus, by Surg. R. B. Bontecou, U. S. V.	Arm amputated July 13, 1864. Died July 15, 1864, from exhaustion. *Spec.* 3039.
52	Rowland, J., Serg't, H, 124th New York, age 26.	May 3, 1863.	Wound of left elbow joint. . . .	May 13, 1863.	Excision of articulating surface of ulna.	Amputation at junctions of upper with middle third. Died June 22, 1863.
53	Ryder, A., Pt., H, 58th Massachusetts, age 23.	June 3, 1864.	Shot wound communict'g with left elbow joint, injuring head of radius.	June 14, 1864.	Excision of left elbow joint, by Surg. R. B. Bontecou, U. S. V.	Died June 24, 1864, from exhaustion following chronic diarrhœa.
54	Shaffer, M. E., Pt., C, 54th Pennsylvania, age 22.	May 15, 1864.	Fracture of condyles of left humerus by musket ball.	May 24, 1864.	Greater portion of external condyle and fragments, thro' enlarged wound, by Surg. J. B. Lewis, U. S. V.	Died June 11, 1864.
55	Simkins, J. A., Pt., F, 7th Wisconsin.	Sept. 17, 1862.	Comminuted fracture of radius and ulna, joint implicated; conoidal ball.	Oct. 6, 1862.	Excision of injured bone.	Died October 8, 1862.
56	Smith, F. M., Corp'l, A, 7th Illinois Cavalry, age 21.	Dec. 17, 1864.	Wound of left elbow by conoidal ball.	Dec. 30, 1864.	Resection of elbow joint.	Died January 14, 1865.
57	Sperry, O. M., Pt., A, 16th Illinois, age 21.	May 14, 1864.	Fracture of olecranon and flesh wound of left arm by conoidal ball.	May 20, 1864.	One and a half inches of ulna excised through straight incision, by Asst. Surg. C. C. Byrne, U. S. A.	Died May 31, 1864, of wound.
58	Stowell, J. T., Pt., C, 5th U. S. Colored Troops, age 30.	Sept. 26, 1864.	Shot wound through right elbow joint by conoidal ball.	Oct. 20, 1864.	Excision of right elbow joint through T incision, by A. A. Surg. F. P. Geisdorf.	Died November 28, 1864, from exhaustion.
59	Sutherland, E. C., Lieut., F, 20th Indiana, age 26.	May 6, 1864.	Wound of right arm, lower third, by conoidal ball.	May 16, 1864.	Outer condyle of right humerus, by A. A. Surg. J. O. Stanton.	Died May 26, 1864, from exhaustion.
60	Thayer, J., Pt., C, 10th Massachusetts, age 21.	May 3, 1863.	Slight fracture of superior extremity of ulna; joint opened.	May 18, 1863.	Three inches extremity of humerus and coracoid and olecranon processes, thro' straight incision, by Asst. Surg. C. A. McCall, U. S. A.	Died of pyæmia, May 27, 1863. *Spec.* 1178.
61	Tinnel, S., Ohio State Militia, age 40.	July 14, 1863.	Wound of left ulna, elbow, and left hip.	Aug. 5, 1863.	Excision of olecranon and two inches of ulna.	Died August 23, 1863, of pyæmia.
62	Venable, J., Pt., C, 12th New Jersey, age 20.	May 3, 1863.	Wound of left elbow joint.	May 16, 1863.	Excision of two inches of ulna and three of humerus.	Died June 16, 1863, of pyæmia.
63	Wesley, C., Pt., G, 4th New York H. Artillery, age 18.	June 18, 1864.	Fracture of ulna and head of radius.	June 24, 1864.	Excision, by Surg. O. A. Judson, U. S. V. See Case 1813, p. 881.	Died July 19, 1864, of pyæmia. *Spec.* 2278.
64	West, J. S., Pt., A, 5th Maryland.	Sept. 17, 1862.	Conoidal ball passed through right elbow joint.	Oct. 2, 1862.	Excised, by Surg. H. S. Hewit, U. S. V. See Case 1810, p. 880.	Died October 20, 1862. *Spec.* 435.
65	Wheeler, Z., Pt., F, 63d New York, age 43.	June 2, 1864.	Fracture of upper extremity of left ulna, opening joint; number of fragments removed.	June 13, 1864.	Two and a half inches of ulna, head and one-half inch of radius, by A. A. Surg. R. Westerling.	Died July 5, 1864. *Spec.* 2588.
66	*Whitinger, R. G.*, Pt., G, 16th Mississippi, age 17.	April 2, 1865.	Comminution of lower third left humerus by a conoidal ball, joint implicated.	April 7, 1865.	Lower third of humerus, including condyles, by A. Surg. W. D. Wolverton, U. S. A.	Died April 26, 1865, from exhaustion following operation.
67	Wilber, J., Pt., E, 72d New York, age 23.	May 4, 1862.	Fractured condyles of right humerus, ball lodging in elbow joint.	May 16, 1862.	Excision of entire joint, by Surg. R. B. Bontecou, U. S. V.	Died June 4, 1862, of pyæmia.
68	Youngs, T., Pt., A, 5th Colored Troops, age 29.	Sept. 29, 1864.	Head of right radius fractured and joint opened by conoidal ball.	Oct. 25, 1864.	Excision of head and one-half inch of neck of radius, by A. A. Surg. O. Warner.	Pyæmia supervened. Died Dec. 5, 1864.
69	Zimmer, C., Pt., M, 7th New York H. Artillery, age 20.	June 3, 1864.	Gunshot wound through right elbow joint.	June 16, 1864.	Exc., by Surg. G. L. Pancoast, U. S. V. See Case 1811, p. 880.	Died June 25, 1864, of hæmorrhage. *Spec.* 2582.

§ *Excision with Undetermined Result.*—Of the one hundred and ninety-seven intermediary excisions at the elbow, the result remains undetermined in one instance:

Case 1814.—Private J. Walker, 5th New York (Duryea's Zouaves), is reported by Assistant Surgeon B. Howard, U. S. A., to have been "wounded at the second battle of Bull Run, August 30, 1862," and to have undergone "resection of the elbow joint on the field on September 4, 1862." It is impracticable to terminate this case. The name does not appear on the regimental returns, or on the registers of any of the field or base hospitals at Alexandria or Washington; neither is it found on the lists of deaths and discharges, nor on lists of applications for pension, nor on reports of the Adjutant General of New York.

The mode of operating was noted in less than half the cases; but the method by a single straight incision appears to have been most commonly adopted:[1]

3. Secondary Excisions at the Elbow.—Fifty-four operations, grouped in this category, were practised thirty days or more subsequent to the reception of shot injury. But five cases, or 9.2 per cent., terminated fatally, the ulterior histories of all having been traced.[2] Such evidence appears to show conclusively that excision at the elbow for the effects of shot injury may be done after the inflammatory phenomena have subsided, with as little jeopardy to life as excisions for disease entail, and consequently with far less risk than primary excisions for injury involve. But such secondary excisions can only be practised on those patients who have survived the dangers of the inflammatory stage. In this group, the proportion of complete excisions was relatively greater than in the primary and intermediary series.[3]

§ *Recoveries after Secondary Excisions at the Elbow.*—The forty-nine operations of this group were practised on forty-four Union and five Confederate soldiers,—on the right in twenty-two, and on the left elbow in twenty-seven. Four patients returned to modified duty, four were exchanged, and forty-one were discharged and pensioned. Two of the patients recovered after consecutive amputation in the upper third of the arm, and two after ulterior operations for necrosis of the resected bone-ends.

Case 1815.—Private R. Brocklehurst, Co. A, 116th Pennsylvania, aged 21 years, was wounded at Chancellorsville, May 3, 1863, and admitted to Harewood Hospital, Washington, on the following day. Surgeon R. B. Bontecou, U. S. V., noted: "Gunshot wound of arm." Surgeon J. Hopkinson, U. S. V., reported the patient's admission to Mower Hospital May 10th, with the following description of the injury and operation: "Gunshot wound of left elbow, shattering internal condyle and olecranon process. Resection was performed, by a straight incision, on July 11th, by Acting Assistant Surgeon C. R. McLean. The treatment consisted of stimulants and anodynes, and cold-water dressings. On July 29th, the splints were removed and the arm placed on a pillow. September 2d, wound healing rapidly. December, 1863, wound nearly well." The specimen, represented in the annexed wood-cut (Fig. 636), shows the excised bones of the elbow, consisting of the head of the radius, the olecranon and coronoid processes, and one inch of the shaft of the ulna and two inches of the extremity of the humerus, all the structures being changed by caries and partially absorbed. It was contributed by the operator. The patient was assigned to the Veteran Reserve Corps May 12, 1864, and mustered out of service June 15, 1865, and pensioned. In September following, he was furnished with an apparatus by D. W. Kolbé, of Philadelphia, which he wore, however, only about one month, finding it "too heavy and chafing his arm," as he states in his application for commutation. Examiner W. Jewell, of Philadelphia, certified, September 18, 1866: "The ball passed through the left elbow joint. A resection was performed, but it has left the arm below the elbow entirely useless. The arm hangs from the elbow like a wet rag." The Philadelphia Examining Board, consisting of Drs. H. E. Goodman, T. H. Sherwood, and J. Collins, reported, September 4, 1873: "Condyles and articulating surface of humerus having been removed, the joint is limber and hangs useless." The pensioner was paid June 4, 1875.

Fig. 636.—Bones of left elbow excised for caries 10 weeks after shot fracture. *Spec.* 2593.

Of the three following early secondary resections, the first and third were practised

[1] The method was specified in 83 instances as: Straight incision, 55; crucial, 2; T-shaped, in 6; *Liston's* ⊣-shaped, in 2; Moreau's H-shaped, 10; ⊥ incision, in 4; V-shaped incision in 1; S-shaped, or otherwise curvilinear, in 3.

[2] This conclusion is significant, since, as may be seen by consulting Table CVI, on page 845, there were few reported instances of excision at the elbow that were not traced to their termination. Of ten such instances, five are known to have been primary or intermediary operations. It is improbable that the five remaining cases were all secondary operations, and improbable that they all resulted fatally, and the probability of the coincidence of the two improbabilities is almost infinitesimally small. But assuming that the five were all secondary fatal excisions, this group would consist of 59 cases with 10 deaths, or 16.9 per cent., 4.6 per cent. less than the mortality of primary excisions. A strong presumption of the greater safety of secondary excisions is therefore presented.

[3] The extent of the excision was specified in every instance but one. The joint ends of the three bones were reported removed in 23 cases (certainly in 7 cases in which the point is directly adverted to, and probably in 16 others entered as "complete excisions of the joint" or by equivalent expressions);—the articular extremities of the humerus and ulna, in 12 cases;—the humerus alone, in 9 cases;—the upper ends of the radius and ulna, in 1 case;—the upper end of the ulna alone, in 4 cases;—the upper extremity of the radius alone, in 4 cases.

for disorganization of the joint following fracture, the second for destructive arthritis from periarticular wound; the third was remarkable for the characteristic burning pain consequent on lesion of the ulnar nerve, periodically affecting the otherwise useful limb.

CASE 1816.—Private Mathias Rogers, Co. A, 38th Colored Troops, aged 22 years, was wounded at Deep Bottom, September 29, 1864, and was sent to Portsmouth, and admitted to Balfour Hospital on the following day. Assistant Surgeon J. H. Frantz, U. S. A., noted: "Compound comminuted gunshot fracture of the internal condyle of the right humerus, opening the elbow joint; ulna and radius fractured. On November 4th, ether was administered, and Acting Assistant Surgeon Oswald Warner exsected the elbow joint, making a T incision. At the time of operation the patient was much enfeebled from the effects of the wound and long-continued discharge. The arm was slightly swollen; the wound appeared healthy and was discharging freely; the articular cartilages were destroyed by suppuration. After the operation the symptoms were at first unfavorable, but afterward he steadily improved. Stimulants, tonics, anodynes, nutriments, and simple dressing constituted the after-treatment." In March, 1865, he was transferred to Grant Hospital, New York, and thence discharged the service April 1, 1865, and pensioned. Surgeon W. H. Thurston, U. S. V., states, in a certificate for discharge: "Resection of olecranon process, right elbow, the result of a gunshot wound." Examiner James Phillips, of Washington, reported, September 16, 1865: "Partial resection of right elbow joint. He cannot pronate or supinate the forearm; anchylosis nearly complete." The disability was rated at total. The pensioner died April 13, 1868; cause of death unknown to the Pension Bureau. The specimen (FIG. 637) consists of the olecranon and coracoid processes, and the articular extremity of the excised humerus just above the condyles, from the right elbow. The articulation is entirely destroyed by suppuration. Contributed by Assistant Surgeon J. H. Frantz, U. S. A.

FIG. 637.—Right elbow excised secondarily. *Spec.* 1050.

CASE 1817—Corporal F. Ott, Co. E, 93d Pennsylvania, aged 35 years, was wounded March 25, 1865, in an assault on Fort Steadman, in the lines about Petersburg. Surgeon S. F. Chapin, 139th Pennsylvania, reported his admission to the hospital of the 2d division of the Sixth Corps, with "a slight gunshot wound of the right arm by a minié ball." The patient was transferred to the Sixth Corps depot hospital at City Point, where Assistant Surgeon J. S. Ely, U. S. V., reported: "A gunshot flesh-wound of the right forearm." The patient was sent, March 27, 1865, on the hospital transport "State of Maine" to Washington, and entered Finley Hospital, March 29th. The wound, as reported by Acting Assistant Surgeon C. J. Polk, who has published an account of the case,[1] was regarded as trivial for more than a week. Pyæmic symptoms supervened. It was discovered that the joint was affected with suppurative inflammation, and on May 6, 1865, Surgeon G. L. Pancoast, U. S. V., excised the joint, "removing an inch of the humerus and the half of the head of the radius, and the olecranon process of the ulna." The preparation (FIG. 638) was presented to the Museum by Dr. Pancoast (*Cat. Surg. Sect.*, 1866, p. 154). There has been no fracture of the articular extremities, but ulceration and destruction of the cartilages evidently existed. There is a transverse section of the humerus above the trochlea, half an inch from the point at which the bone was ultimately sawn. The case progressed favorably, and the patient was discharged August 1, 1865, and pensioned. Examiner M. D. Benedict, of Washington, reported, at that date: "He had compound comminuted fracture (!!) of the right elbow joint: the entire joint was removed by excision; limb entirely useless for labor." Examiner W. B. Lowman, of Johnstown, Pennsylvania, reported, September 6, 1873: "Resection of right elbow joint; the limb is two inches shorter than its fellow; the arm is but of little use; he cannot grasp anything with his hand. Address, Scalp Level, Cambria County, Pennsylvania."

FIG. 638.—Excised bones of right elbow. *Spec.* 4287.

CASE 1818.—Private G. L. Essick, Co. K, 7th Pennsylvania Reserves, aged 19 years, was wounded at Antietam, September 17, 1862, and entered Hospital No. 3, Frederick, on October 1st, where he underwent excision of the elbow joint. Assistant Surgeon J. H. Bill, U. S. A., who performed the operation, transmitted the following report of the case: "Gunshot wound of right elbow joint. I saw the case on the 3d of October. The patient was not in a good state of health. The olecranon was destroyed in part, the internal condyle wounded, and the ulnar nerve divided. The indication here was for constitutional treatment and then a resection. On the 29th of October, the patient's condition being much improved, a resection of the joint was made, a T-shaped incision being employed. The condyles of the humerus and the olecranon process were removed. The insertion of the brachialis anticus was preserved. None of the radius was removed. No hæmorrhage occurred. The sensation in the outer fingers, as before the operation, is deficient. Limb placed on a pillow, five wire sutures used, and cold-water dressings. November 10th, wound united in part; suture removed and limb placed on an angular splint of 90°. Will do well. December 1st, wound nearly healed; sensation in outer fingers greatly improved; patient's health and strength completely restored; limb will be serviceable." The excised parts, including the coronoid process, were contributed to the Museum by the operator, and are represented in the annexed wood-cut (FIG. 639). They are carious, and the line of section in the ulna is exceedingly oblique. On January 24th, the patient was transferred to Hospital No. 1, whence he was discharged April 4, 1863, and pensioned. Examiner T. B. Reed, of Philadelphia, September 13, 1865, certified: "Gunshot wound of right elbow joint; resection of upper third of ulna. Use and power of arm a good deal impaired." The Philadelphia Examining Board, consisting of Drs. H. E. Goodman, J. Collins, and T. H. Sherwood, reported, May 27, 1874: "Ball struck behind internal condyle of humerus, passing through and out in front. Result, fracture of condyle, with loss of the ends of the bones, producing considerable deformity, leaving the joint partially anchylosed. Cannot extend beyond angle of forty-five degrees [135°?]. Rotation seriously impaired. Disability rated three-fourths. Ball re-entered abdomen three inches above crest of right ilium, and out one inch to left of median line, above umbilicus. Complains of burning sensation in track of wound in bad weather. Does not cause him any serious trouble otherwise. Disability rated one-fourth." The pensioner was paid June 4, 1875.

FIG. 639.—Bones of right elbow excised for caries and shot injury. *Spec.* 842.

[1] POLK (C. J.), *Rare Cases in Surgery*, in *The* [*Philadelphia*] *Medical and Surgical Reporter*, 1874, Vol. XXXI, p. 44. The operation by Dr. PANCOAST is the second case reported.

Imperfect recoveries with partial mobility are detailed in the next three abstracts:

CASE 1819.—Corporal W. R. Corey, Co. H, 4th Rhode Island, aged 23 years, was wounded at Poplar Grove Church, September 30, 1864. He was treated in a Ninth Corps hospital and at City Point; thence he was sent to New Jersey, and admitted into Beverly Hospital on October 15th. Assistant Surgeon C. Wagner, U. S. A., the operator, noted:[1] "Gunshot wound of the left arm, injuring the upper part of the ulna. On December 11, 1864, three inches of the upper third of the ulna were resected, under chloroform. At the time of operation the parts were in a sloughing condition, and the head of the bone was exposed and necrosed. The general health of the patient was favorable, and he did well under a treatment of cold-water dressings." The patient was transferred to Whitehall Hospital, Bristol, April 6, 1865, and discharged from service June 7, 1865, and pensioned. The drawing from which the cut (FIG. 640) is taken was executed by Mr. Baumgras, Hospital Steward, U. S. A. The pathological specimen (FIG. 641), contributed to the Museum by the operator, consists of the coronoid and olecranon processes and two and a half inches of the shaft of the left ulna excised after gangrene had attacked a shot flesh wound of the forearm. The bone appears to have been slightly contused about midway on the posterior surface. There has been a slight osseous deposit on the posterior portion of the shaft. The tip of the olecranon is carious. Examiner C. McKnight, of Providence, July 21, 1865, reported the arm as entirely useless below the elbow; and, on June 30, 1866, reported, "the wound still continues open and the patient has entirely lost the use of the arm; disability is rated total and permanent." This pensioner is reported to have died June 11, 1869.

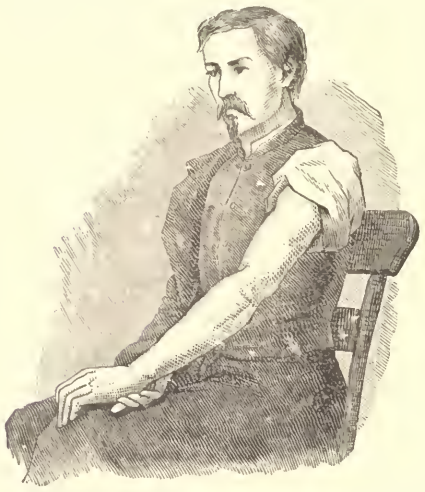

FIG. 640.—Results of an excision of the upper extremity of the left ulna. (From an aquarelle by BAUMGRAS.)

FIG. 641.—Upper part of left ulna excised for caries following shot contusion. *Spec.* 3713.

CASE 1820.—Private W. Dempsey, Co. C, 36th Colored Troops, aged 20 years, was wounded at Deep Bottom, September 29, 1864, and admitted to the field hospital of the 3d division, Eighteenth Corps, where Surgeon J. W. Mitchell, 4th Colored Troops, recorded: "Gunshot wound of arm." Assistant Surgeon J. H. Frantz, U. S. A., reported the patient's admission to Balfour Hospital, Portsmouth, October 5th, and contributed the specimen (shown in FIG. 2, PLATE LI, *Spec.* 1365), with the following account of the operation: "Severe penetrating gunshot wound of right elbow; joint opened; considerable comminution and laceration. November 3d, slight swelling of parts; copious discharge. Patient much debilitated from the effects of the wound. Exarticulation of two and a half inches of lower portion of humerus and removal of olecranon process through a T-shaped incision, by Acting Assistant Surgeon C. C. Ela. Sulphuric ether was used. The treatment consisted of stimulants, nutriments, and simple dressings. The patient steadily improved." He was discharged from service June 1, 1865, by reason of "partial anchylosis of the elbow joint and the limb being nearly powerless." The specimen consists of the excised parts of the elbow joint. The outer condyle and the adjacent part of the humerus is wanting, and the articular surface is carious. Examiner J. Williamson, of Portsmouth, Virginia, May 24, 1866, certified: "Total stiffening of right elbow joint and loss of use of right arm," etc. Examiner S. B. Kinney, March 2, 1874, certified: " * * Arm in a semi-flexed position, with very slight motion at the false joint, rendering it of no more use than an artificial one would be. * * The pensioner is also suffering from disease of the hip joint with caries of the head of the femur." The pensioner was paid June 4, 1875.

CASE 1821.—Private A. M. McAtee, Co. F, 23d Ohio, aged 20 years, was wounded in the left elbow, at Antietam, September 17, 1862. Five days afterward he was admitted to Mount Pleasant Hospital, Washington, where Assistant Surgeon C. A. McCall, U. S. A., excised the injured joint on October 21st. The patient recovered, and was discharged from service, December 30, 1862, and pensioned. The specimen, represented in the wood-cut (FIG. 642), was contributed by the operator, and consists of two inches of the extremity of the humerus, and the ulna removed just below the coronoid process, the olecranon being fractured, and a vertical fracture extending through the middle of the trochlea. The articular surface is partly eroded. An account of this case was published by Dr. McCall in the *Medical and Surgical Reporter*, Vol. IX, 1862-63, p. 231, as follows: "Gunshot wound of elbow joint, causing compound comminuted fracture of olecranon, of condyle of humerus, and of the shaft of the latter bone for some distance above the articular head. About half the lower third of the humerus was removed, together with the olecranon and articular head of the ulna. The radius was left intact. The arm was put upon a straight splint, with simple absorbent dressings to parts. Tonics and stimulants. The straight splint was exchanged for an angular pasteboard one about November 1st, the forearm being semi-flexed upon the arm. No untoward symptoms occurred; the wound healed well, and ceased discharging the first week in December. At this date all pain and most of the swelling had disappeared. The fingers could be moved slightly, but the arm had no power to support itself without the splint. The mobility of the joint was considerable: the arm could be moved, without causing pain or inconvenience, from a nearly straight to a semi-flexed condition." Examiner W. D. Scartf, of Bellefontaine, Ohio, certified, on the following respective dates: April 4, 1863: "The ball seems to have passed longitudinally through the joint, thereby destroying the joint and rendering the arm useless." February 16, 1864: "The wound has healed entire, but the forearm hangs just as an appendage and is an encumbrance, of no use to him." November 11, 1866: "The injury is fully equal to the loss of the forearm." September 4, 1873: "The muscles are all shrunken, and the entire arm is more of an encumbrance than otherwise." The pensioner was paid September 4, 1875.

FIG. 642.—Bones of left elbow excised for shot fracture. *Spec.* 343.

[1] WAGNER (C.), *Reports of Interesting Surgical Operations at Beverly, New Jersey.* 1865, p. 4.

There were examples, among the recoveries after secondary excisions, in which the functions of the forearm and hand are reported to have been most satisfactorily preserved, as in those numbered, 3, 5, 21, 28 of the succeeding TABLE CXII; but in most of the instances recorded in detail, control of the movements of the limb was but limited:

CASE 1822.—Private J. M. Tarbell, Co. E, 2d U. S. Sharpshooters, aged 21 years, was wounded at the Wilderness, May 6, 1864, and was admitted into a field hospital of the Second Corps, and thence sent to Washington, and received into Harewood Hospital on the 26th. Surgeon R. B. Bontecou, U. S. V., noted: "Gunshot wound of the right arm, severely injuring the elbow joint. On admission, the parts were considerably swollen and inflamed, and the constitutional state of the patient was very poor. The arm was kept quiet, and cold applications with general constitutional treatment employed until June 18th, when an operation was deemed necessary, which was performed, on that day, by Surgeon R. B. Bontecou, U. S. V., who resected the elbow joint. The patient improved in health after the operation, and, at this date, December 26, 1864, the wound has entirely healed and the patient is about to be discharged from service. He has no ability to flex the right arm, which is about two inches shorter than the left, but in other respects useful. Splints, simple dressings, and supporting treatment." The photograph from which the cut (FIG. 644) is taken, together with the specimen (FIG. 643), was contributed by the operator. The specimen consists of two fragments of carious bone, representing the condyles of the humerus, the olecranon, and head of the radius, excised from the right elbow. Tarbell was discharged from service December 31, 1864, and pensioned. Examiner C. L. Allen, of Vermont, reported, August 3, 1873: "A portion of the lower extremity of the humerus was removed by exsection. The right humerus is two and one-half inches shorter than the left. The right arm and forearm measure, respectively, one and a quarter, and one and a half inches less than the left in circumference. There is complete loss of rotation of the hand except from the shoulder joint. The forearm can be extended, but can be flexed only to an angle of about one hundred and ten degrees; there is fair use of the hand. The forearm is evidently not strong, especially in pushing. The hand cannot be brought near enough to the head to be of any use in eating. Disability total." This pensioner was paid March 4, 1874.

FIG. 643.–Excised portions of the right elbow joint after caries from shot injury. *Spec.* 3602.

FIG. 644.—Appearance after a secondary excision of the elbow for shot injury. [From a photograph.]

CASE 1823.—Sergeant M. B. Soule, Co. E, 16th Maine, aged 25 years, was wounded at Gettysburg, July 1, 1863, and admitted to the field hospital of the 2d division, First Corps. Surgeon C. J. Nordquist, 83d New York, noted: "Gunshot wound of right arm." On September 5th, the patient reached Baltimore, whence Assistant Surgeon D. C. Peters, U. S. A., in charge of Jarvis Hospital, contributed the specimen (FIG. 645), with the following history: "He was badly wounded in the right elbow joint. Upon examination it was found that a minié ball had entered just above the head of the radius and passed directly through the humerus, between the condyles. The joint was in a high state of inflammation, extending up and down the arm. About the latter part of September the wound was attacked with gangrene, which was soon overcome by the local application of permanganate of potassa. October 29th, patient feverish; secretions large; skin moist; appetite good; rest not disturbed; desirous of having the limb sawed. Excision of the entire elbow joint, by cross-incision, was performed by Acting Assistant Surgeon F. Hinkle. The head of the radius and the condyles of the humerus were removed, ether being used as the anæsthetic. The patient reacted promptly. The limb was placed in an angular tin splint. December 3d, patient is in fine spirits; parts entirely healed; arm looks natural; a false joint is forming. December 29th, patient is well, and can raise the forearm fully one inch without any assistance. The case has been entirely successful." The specimen consists of three and a half inches of the lower extremity of the humerus. It was sawn through one and a half inches below the point of the final excision. The extremity is carious, but the outer condyle, which was split off, has imperfectly united to the shaft. The patient was transferred to De Camp Hospital, New York, April 24th, and subsequently to Cony Hospital, Augusta, where he was discharged from service June 24, 1864, and pensioned. Examiner N. R. Boutelle, of Waterville, Maine, September 28, 1864, certified: "Wound still discharging;" and again, in October, 1866: "Has now no use of arm and next to none of forearm." In a supplementary letter, dated February 4, 1867, he stated: "About three inches of the lower third of the right humerus has been removed, including a portion of the condyles. A false joint and also false anchylosis now exist. The forearm can only be flexed to a right angle and only extended one-third. The power of rotating the forearm and hand is lost. The forearm is also distorted," etc. Examiner R. D. Barber, of Worthington, Minnesota, reported, September 6, 1873, that: "The resection shortened the arm about four inches, and ligamentous union only has resulted." The pensioner was paid September 4, 1875.

FIG. 645.—Condyles of right humerus excised for caries after shot fracture. *Spec.* 1995.

That the ulterior usefulness of limbs after excision at the elbow depends greatly upon

judicious after-treatment, is a proposition made as obvious by the cases of the secondary group as by those of the primary and intermediary series. Various expedients were adopted in order to secure, in the early period after the operation, immobility of the limb and simultaneously access to the wound for facility of dressing, and, later, to make passive movements conveniently. The felt splint of Dr. Ahl[1] (FIG. 647), in which fenestra of any size might be cut, and which permitted water or ice dressings to be used, was found very useful, as in CASE 1794. Dr. Stromeyer's excellent double bracketed splint[2] (FIG. 646) was unknown at the time.

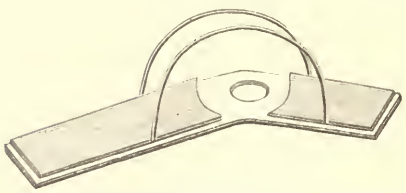

FIG. 646.—ESMARCH'S elbow splint. [Reduced from STROMEYER'S drawing.]

FIG. 647.—AHL'S felt elbow splint. [From specimen in A. M. M.]

CASE 1824.—Private M. Lewis, Co. A, 133d Pennsylvania, aged 19 years, was wounded at Fredericksburg, December 13, 1862, and admitted to Point Lookout Hospital three days afterward. Assistant Surgeon C. Wagner, U. S. A., forwarded the specimen (*Cat. Surg. Sect.*, 1866, p. 161, *Spec.* 998), with the following description of the injury and operation of the case: "He was wounded by a minié ball in the posterior aspect of the left arm, just over the olecranon. The inner portion of the olecranon was shattered, and the inner condyle with a portion of the trochlea broken off. The ball lodged among the muscles on the anterior aspect of the forearm, about over the head of the radius, and was cut out on December 25th. When the patient arrived his general condition was good. It continued so after his admission. There was considerable swelling of the elbow and forearm, which alternately subsided and increased every few days up to the time of the operation. January 15th, chloroform having been administered, the articulation was exposed by the quadrilateral flap-operation of Moreau, and the olecranon sawed off at the base of the coronoid process. The detached inner condyle, which was thrown forward and inward, was next removed, the ulnar nerve being found intact. The lower extremity of the humerus was then sawed off just above the condyle. The flap was laid back and the edges of the wound brought together and detained by eight sutures. The operation was performed by Acting Assistant Surgeon T. H. Allison. January 21st, strips of adhesive plaster were applied in order to bring the edges of the wound into closer apposition, an opening being left for the escape of pus. After the operation the arm was supported by a cushion, the forearm being pronated and slightly flexed. The case did well, and when last seen the wound had healed. The joint has motion as follows: extension very nearly perfect; flexion about ten degrees with elbow at right angle, and about half the full extent of pronation and supination; movement increasing daily."[3] The specimen (shown in FIGURE 4 of PLATE LI) consists of the excised bones of the elbow, the joint being carious, and a little indifferent callus being shown near the inner condyle. The patient was discharged March 13, 1863, and pensioned. Examiner J. Lowman certified, April 11, 1863: "Ball passed through elbow, which required excision of the joint, leaving anchylosis." Examiner W. B. Lowman, of Johnstown, August 5, 1871, reports that: "The first time he was examined for pension his arm was not altogether healed, but he could use it better than now. He could extend it farther; now he cannot fully extend the arm, or rotate the hand or arm. He cannot push from him, but can raise or lift anything," etc. Substantially the same report was made in 1873. The disability was rated three-fourths. The pensioner was paid June 4, 1875.

CASE 1825.—Private G. Thompson, Co. E, 15th New Jersey, aged 21 years, was wounded at the Wilderness, May 5, 1864. Surgeon E. F. Taylor, 1st New Jersey, recorded his admission to the field hospital of the 1st division, Sixth Corps, with "gunshot fracture of left elbow." On May 11th, the patient entered Finley Hospital, Washington, where he was operated on by Surgeon G. L. Pancoast, U. S. V., who reported as follows: "The ball entered on the posterior surface of the arm near the internal condyle, and passed through the elbow joint, fracturing the olecranon process and the upper end of the ulna. June 7th, parts much swollen and inflamed; constitutional state of patient good. Resection of the elbow joint was performed, chloroform being used as the anæsthetic. Favorable progress followed. The treatment consisted of water dressings, tonics, and stimulants. The patient rapidly recovered." The specimen, represented in the annexed cut (FIG. 648), shows the excised parts, consisting of nearly two inches from the lower extremity of the humerus, the head of the radius, and the upper portion of the ulna cut half an inch below the coronoid process. The articular surfaces are eroded. It was contributed by the operator. The patient was discharged February 21, 1865, and pensioned. Examiner J. Nichols, of Washington, D. C., February 23, 1865, certified: "Gunshot fracture of left elbow joint, with resection. Not yet entirely healed. Limb shortened about two inches," etc. Examiner C. Hodge, jr., certifies, March 4, 1867: "The joint is entirely cut out and the arm thereby rendered entirely useless for manual labor." Drs. J. B. Coleman, C. Hodge, jr., and W. W. L. Phillips, of the Trenton Board, reported, September 8, 1873: "Ball destroyed the elbow joint, from which bones were removed, and there remains a false joint." The pensioner was paid September 4, 1875.

FIG. 648.—Bones of left elbow excised for shot injury. *Spec.* 2465.

[1] AHL (D.), *Adaptable Porous Splints, with Directions for their employment in Fractures and other Surgical Lesions*, Newville, Jan., 1875, p. 10.

[2] STROMEYER (L.), *Erfahrungen über Schusswunden im Jahre* 1866, Hannover, 1867, S. 50. A modification of the obtuse-angled splint used by Professor STROMEYER, suggested by Professor ESMARCH in a visit to the former at Langensalza, which Dr. STROMEYER says "should be generally known," and Dr. H. FISCHER (*Lehrbuch der Allg. Kriegs-Chir.*, 1868, S. 234) considers "most convenient to the surgeon and comfortable to the patient, either in the expectant treatment or with after treatment of resections."

[3] See published accounts of this case by Dr. JOHN STEARNS, jr. (*Boston Med. and Surg. Jour.*, 1863, Vol. LXVIII, p. 252), and by Dr. C. WAGNER (in *Am. Jour. Med. Sci.*, 1863, Vol. XLVI, p. 39).

TABLE CXII.

Summary of Forty-nine Cases of Recovery after Secondary Excision of the Bones at the Elbow for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Anstice, E., Pt., E, 61st Pensylvania, age 34.	May 31, 1862.	Caries following shot fracture of bones of right elbow joint.	Aug. 12, 1862.	Complete excision of articular surfaces of humerus, radius, and ulna, by A. A. Surg. J. E. Steele.	Disch'd Nov. 28, 1862; pensioned. Anchylosis; arm atrophied; rotation absent.
2	*Arant*, A. J., Pt., 5th Alabama, age 26.	Sept. 19, 1864.	Fracture of inner condyle of right humerus.	Oct. 20, 1864.	Three inches of humerus, thro' straight incision.	Retired January 6, 1865.
3	*Bowe*, T., Serg't, F., 6th Louisiana, age 26.	Sept. 17, 1862.	Shot wound, with fracture of right elbow.	Mar. 13, 1863.	Olecranon, articular surface of ulna, and inferior end of humerus.	Furloughed June 15, '63. Nearly entire use of arm and hand.
4	Brooklehurst, R., Pt., A, 116th Pennsylvania, age 21.	May 3, 1863.	Fracture of left epitrochlea and olecranon.	July 11, 1863.	Excision, by Dr. C. R. McLean. See CASE 1815, p. 884.	Disch'd June 15, 1865; pensioned. *Spec.* 2593.
5	Burgess, C., Pt., D, 32d Colored Troops, age 37.	Dec. 7, 1864.	Fracture of left ulna into elbow joint by conoidal ball.	Jan. 29, 1865	Excision of joint, five inches of bone, thro' straight incision, by Dr. F. E. Martindale.	Disch'd May 22, 1865; pensioned. No anchylosis of joint; quite good use of hand.
6	Cooper, W., Pt., A, 82d Ohio, age 28.	July 1, 1863.	Comminuted fracture of left joint by conoidal ball.	Aug. 22, 1863.	Five inches of humerus and upper extremity of radius and ulna, straight incision twelve inches long, by Surg. S. D. Freeman, U. S. V.	Spicule of bone came away; arm useless. Disch'd April 23, 1864; pensioned.
7	Corey, W. R., Corp'l, H, 4th Rhode Island, age 23.	Sept. 30, 1864.	Shell flesh wound of left forearm; bones exposed and necrosed.	Dec. 11, 1864.	Excision, by Asst. Surg. C. Wagner, U. S. A, See CASE 1819, p. 886.	Disch'd June 7, 1865; pensioned. Arm useless. Died June 11, 1869. *Spec.* 3713.
8	Criggen, F. O., Pt., C, 3d New York, age 24.	May 14, 1864.	Shot wound of left elbow joint. Iron ball, from shrapnel shot, extracted June 1st.	June 20, 1864.	Condyles of humerus and point of ulna excised thro' straight incision, by A. A. Surg. T. Liebold.	Transferred for muster out May 10, 1865; not a pensioner.
9	Davis, R. M., Corp'l, F, 5th Minnesota, age 34.	Aug. 23, 1864.	Shot fracture of head of right radius by musket ball.	Oct. 23, 1864.	Excision of head of radius....	Disch'd June 24, 1865; pensioned. Rotation destroyed.
10	Dempsey, W., Pt., C, 36th Colored Troops, age 20.	Sept. 29, 1864.	Right elbow joint opened by conoidal ball.	Nov. 3, 1864.	Excision, by A. A. Surg. C. C. Ela. See CASE 1820, p. 886.	Disch'd June 1, 1865; pensioned. *Spec.* 1365.
11	Essick, G. L., Pt., K, 7th Pennsylvania Reserves, age 20.	Sept. 17, 1862.	Fracture and caries of right elbow, and division of ulnar nerve, by musket ball.	Oct. 29, 1862.	Excision, by Asst. Surg. J. H. Bill, U. S. A. See CASE 1818, p. 885.	Serviceable limb. Disch'd April 4, 1863; pensioned. Partial anchylosis. *Spec.* 842.
12	Green, A., Pt., E, 98th Ohio, age 34.	Oct. 8, 1862.	Wound of left elbow joint.....	Nov. 10, 1862.	Excision of upper third of ulna.	Pyæmia. Disch'd Jan. 1, 1863; pensioned. Anchylosis; muscular atrophy.
13	Haley, T., Corp'l, F, 84th New York, age 22.	May 8, 1864.	Fracture of left olecranon by conoidal ball; erysipelas.	June 20, 1864.	Articular ends of humerus, radius, and ulna, thro' Liston's incision, by Surg. B. A. Clements, U. S. A.	Joint anchylosed. Disch'd Jan. 26, 1865; pensioned. Atrophy of muscles; loss of rotation.
14	Hathaway, E., Corp'l, H, 3d Wisconsin Cavalry, age 31.	Oct. 9, 1863.	Heads of left ulna and radius fractured; piece of bone removed October 9; pyæmia, erysipelas, necrosis.	Jan. 27, 1864.	Excision of lower end of humerus and upper extremities of radius and ulna, by Surg. H. Culbertson, U. S. V.	False joint formed. Disch'd Feb. 8, 1865; pensioned. Forearm hangs useless, and shortened about four inches.
15	Henby, J. K., Pt., F, 51st Indiana, age 22.	Aug. 14, 1864.	Fracture of right humerus, involving elbow joint, by conoidal ball; hæm's from brachial.	Sept. 16, 1864.	Excision, by Act. Asst. Surg. A. Robillard.	Partial anchylosis. Disch'd April 25, 1865; pensioned. Has some motion of joint; fingers closed.
16	Keller, M. Van B., Pt., B, 1st Pennsylvania Reserves, age 21.	June 30, 1862.	Ball passed laterally through right elbow joint; arm œdematous; joint full of pus. July 28, 1862, incision thro' to back of joint, uniting wounds of entrance and exit; detached fragments removed.	Sept. 1, 1862.	Incision four inches, crossing previous one; one and a half inches of humerus, radius, and ulna removed by chain saw and bone forceps, by A. A. Surg. J. H. Packard.	Disch'd February 20, 1863; pensioned. Arm and hand useless; can be moved in any direction without resistance. Dr. Packard mentions (*Handbook of Op. Sur.*, 1870, p. 167) the reception of letters written by this patient.
17	Kerr, J. G., Pt., C, 91st Pennsylvania, age 25.	May 23, 1864.	Compound comminuted fracture of right elbow by conoidal ball.	July 2, 1864.	Both condyles of humerus and entire upper third of ulna by linear incision, by Surg. I. I. Hayes, U. S. V.	Disch'd July 24, 1865. Periosteal formation of bone; union of radius and ulna; anchylosis; no radial motion; pensioner. Limb nearly useless.
18	Kidd, W. R., Serg't, E, 12th Pennsylvania.	Aug. 29, 1862.	Musket ball through left elbow and into body above crest of ilium.	Oct. 2, 1862.	Two and a half inches of humerus and olecranon removed.	Disch'd Dec. 15, 1862; pensioned. Ball lodged in lumbar muscles; health good; arm useless.
19	Kluff, L., Pt., D, 2d New Jersey, age 46.	Aug. 27, 1862.	Compound comminuted fracture of right humerus at lower third by conoidal ball.	April 27, 1863.	Excision of four inches of condyles and continuity of humerus through linear incision, by Drs. Risley and Welter.	Discharged March 16, 1863; pensioned. Arm shortened three and one-half inches. False anchylosis.
20	Lewis, M., Pt., A, 133d Pennsylvania, age 19.	Dec. 13, 1862.	Epitrochlea and olecranon shattered; musket ball lodged.	Jan. 15, 1863.	Excision, by A. A. Surg. T. H. Allison. See CASE 1824, p. 888.	Extension nearly perfect; rotation half. Disch'd Mar. 13, 1863; pensioned. *Spec.* 998.
21	*Love*, J. S., Pt., K, 13th North Carolina.	July 3, 1863.	Shot wound through left elbow.	Feb. 11, 1864.	Olecranon and one inch of radius and ulna, by A. A. Surg. T. Liebold.	Healed, with motion of joint. Exchanged March, 1864.
22	Lyon, J., Corp'l, E, 30th Iowa, age 27.	Oct. 21, 1863.	External condyle of left humerus fractured, triceps muscle injured, by buckshot; wound supposed to involve left lung.	1864.	Excision, by A. A. Surg. T. G. Bernays.	Anchylosis. Disch'd February 5, 1864. Died April 5, 1865, of hæmorrhage from lungs.
23	Matthison, E. M., Pt., E, 55th New York, age 34.	May 31, 1862.	Great tumefaction after musket ball comminution of right elbow.	July 6, 1862.	Articulating ends of bones of elbow, thro' straight incision, by A. A. Surg. I. Dicker.	Good use of elbow. Discharged Feb. 10, 1863; pensioned. Partial anchylosis; arm useless.
24	McAtee, A., Pt., F, 23d Ohio, age 20.	Sept. 17, 1862.	Shot fracture of trochlea and olecranon.	Oct. 21, 1862.	Excision, by A. Surg. C. A. McCall, U. S. A. See CASE 1821, p. 886.	Disch'd December 30, 1862; pensioned. *Spec.* 343.
25	McFarland, H., Pt., B, 155th Pennsylvania, age 40.	Oct. 27, 1864.	Disorganization following shot wound of left elbow by conoidal ball.	1865.	Excision of upper part of ulna, by Asst. Surg. G. H. Rugg, 104th New York.	Disch'd July 7, 1865; pensioned. Arm useless. Died October 22, 1867, of pneumonia.
26	Mikesell, D. D., Pt., D, 9th Kansas Cavalry.	May 28, 1863.	Caries of condyles of right humerus following perforation by conoidal ball.	July 3, 1863.	Articulating surfaces of humerus, radius, and olecranon, through V incision, by A. A. Surg. J. Thorne.	Complete union, with anchylosis. Discharged December 10, 1863; pensioned. Arm flexed across chest.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
27	Mixon, W., Pt., C, 2d Infantry.	June 27, 1862.	Condyles of left humerus shattered by conoidal ball.	Aug. 1, 1862.	Lower end of humerus excised.	Disch'd Nov. 8, 1862; pensioned. Arm entirely useless.
28	*O'Brien*, —, Pt., Texas regiment.	———	Disease following fracture of condyles of left humerus by pistol ball.	June, '62, six weeks after.	Six and one-quarter inches of humerus, including condyles, through T incision, by Asst. Surg. J. H. Bill, U. S. A.	Complete recovery. Returned to Provost Marshal.
29	O'Brien, M., Corp'l, A, 143d Pennsylvania, age 20.	July 1, 1863.	Conoidal ball through right elbow joint; fracture of external condyle of humerus.	August, 1863.	Excision, by A. A. Surg. F. Hinkle.	No use in joint. Disc'd Feb. 1, 1864; pensioned. Anchylosis; firm union.
30	Ott, F., Pt., E, 93d Pennsylvania, age 27.	Mar. 25, 1865.	Disorganization of right elbow from shot fracture.	May 6, 1865.	Excision, by Surg. G. L. Pancoast, U.S.V. See CASE 1817, p. 885.	Disch'd Aug. 1, 1865; pensioned. *Spec.* 4287.
31	Pernell, I., Pt., K, 6th Colored Troops, age 21.	Sept. 29, 1864.	Anchylosis after shot fracture of head of left radius.	Sept. 15, 1865.	Head of radius excised thro' straight incision, by Acting Asst. Surgeon E. B. Lyon.	Discharged September 20, 1865; pensioned. Thirteen pieces of bone discharged at intervals; complete anchylosis.
32	Perry, O. H., Pt., C, 97th Illinois, age 33.	April 9, 1865.	Shot fracture of condyles of right humerus and olecranon; also wound of chest.	June 12, 1865.	Excision of inch of humerus, olecranon, and head of radius, by Asst. Surgeon A. Hartsuff, U. S. A.	Disch'd Oct. 18, 1865; pensioned. Entire loss of use of arm; amputated near shoulder for disease of bone.
33	Pilgrim, F., Pt., D, 8th New York Cavalry, age 22.	April 1, 1865.	Suppuration, caries, and erysipelas after fracture of right elbow by a conoidal ball.	May 15, 1865.	Ends of humerus, radius, and ulna excised, by Surgeon R. B. Bontecou, U. S. V.	Gangrene. Disch'd Nov. 6, 1865; pensioned. Whole upper extremity atrophied; arm useless; joint is ligamentous.
34	Ports, J. W., Pt., C, 148th Pennsylvania, age 31.	May 10, 1864.	Fracture of lower extremity of left humerus, involving elbow joint, by conoidal ball.	June 25, 1864.	Condyles, with three inches of shaft of humerus, by Asst. Surg. P. C. Davis, U. S. A.	Aug. 31, two small sequestræ removed. Disch'd Feb. 14, 1865; pensioned. Arm entirely useless. *Spec.* 3182.
35	Powell, O. N., Pt., C, 105th Pennsylvania, age 21.	June 30, 1862.	Disease following shot wound of left elbow joint.	Sept. 24, 1862.	One and one-half inches humerus, two inches ulna, and one inch of radius.	Able to put hand to mouth. Discharged Dec. 26, 1862; pens'd. Atrophy of entire arm.
36	Redpath, S. J., Serg't, A, 82d New York, age 26.	July 3, 1863.	Shell fracture of right radius, upper third; wound closed by sutures.	Aug. 12, 1863.	Two inches of radius, including head, removed, by Acting Asst. Surg. J. H. McLellan.	Necrosed bone and piece of shell removed Nov. 2d; joint anchylosed. Disch'd June 25, 1864; pensioned. Arm useless.
37	Reynaud, C., Pt., H, 2d Kentucky Cavalry, age 28.	May 4, 1864.	Ball ent'd near right olecranon process, passing nearly thro'.	June 13, 1864.	Excision of three inches of upper portion of ulna.	Joint anchylosed. Discharged June 13, 1865; pensioned.
38	Rodgers, E., Serg't, A, 5th Artillery, age 23.	June 9, 1864.	Comminuted fracture of lower end of left humerus by musket ball.	Aug. 8, 1864.	Two and a half inches of humerus, including condyles, through straight incision, by A. Surg. A. Ingram, U. S. A.	To regimental headquarters November 4, 1864. Not a pensioner.
39	Rogers, M., Pt., A., 38th Colored Troops, age 22.	Sept. 29, 1864.	Destructive suppuration of elbow after shot fracture.	Nov. 4, 1864.	Excision, by A. A. Surg. O. Warner. See CASE 1816, p. 885.	Disch'd April 1, 1865; pensioned. *Spec.* 1050.
40	Rowley, J. R., Corp'l, F, 65th Ohio, age 20.	Sept. 19, 1863.	Compound comminuted fracture of right elbow by conoidal ball.	Nov. 12, 1863.	Four inches of end of humerus, with coronoid and olecranon, by A. A. Surg. W. H. Matlock.	Arm amputated three inches below shoulder November 26th. Disch'd June 6, 1864; pens'd. *Specs.* 1929, 2208.
41	Soule, M. B., Serg't, E, 16th Maine, age 24.	July 1, 1863.	Gangrene following round musket ball perforation of elbow.	Oct. 29, 1863.	Excision, by A. A. Surg. F. Hinkle. See CASE 1823, p. 887.	Disch'd June 4, 1864; pensioned. Arm wholly useless; false joint and false anchylosis. *Spec.* 1995.
42	Tarbell, J. M., Pt., E, 2d U. S. Sharpshooters, age 21.	May 6, 1864.	Caries following shot injury of right elbow joint.	June 18, 1864.	Excision, by Surg. R. B. Bontecou, U. S. V. See CASE 1822, p. 887.	Disch'd December 31, 1864; pensioned. *Spec.* 3602.
43	Taylor, B., Pt., D, 20th New York, age 25.	Aug. 30, 1862.	Conoidal ball penetrated left elbow; the inner condyle being broken off slipped upward and anchylosed.	Jan. 22, 1863.	Excision of entire joint, by Surg. I. Moses, U. S. V.	Disch'd June 4, 1863; pensioned. Entire loss of voluntary motion; false joint. *Spec.* 734.
44	*Thomasson, S. G.*, Pt., H, 24th Virginia, age 35.	May 16, 1864.	Conoidal ball fractured inner condyle of left humerus, extending to joint; small spiculæ removed every few days.	June 24, 1864.	Four inches humerus, one and a half inches of ulna, and head of radius, through a vertical incision.	Furloughed July 28, 1864; doing well.
45	Thompson, G., Pt., E, 15th New Jersey, age 21.	May 5, 1864.	Destructive arthritis after shot fracture.	June 7, 1864.	Excision, by Surg. Pancoast, U. S. V. See CASE 1825, p. 888.	Disch'd February 21, 1865; pensioned. *Spec.* 2465.
46	Watkins, T., Pt., E, 8th Iowa Cavalry.	Nov., 1863.	Pistol shot fracture of left elbow joint.	Dec., 1863.	Excision of the elbow.....	Disch'd convalescent Jan. 23, '64. Died from measles Mar. 10, '64.
47	Williams, G., Serg't, K, 14th New York Cavalry, age 39.	Mar. 12 1865.	Disorganization consequent on fracture of left external condyle by conoidal ball.	April 18, 1865.	Olecranon and debris of condyle of humerus, thro' three-inch incision, by Surg. A. McMahon, U. S. V.	Disch'd May 10, 1865; pensioned. Complete anchylosis at an angle of 120°; no motion.
48	Weymer, M., Pt., D, 18th New York, age 26.	June 27, 1862.	Rifle ball passed directly thro' joint; caries of articular surfaces.	July 28, 1862.	Complete excision of left elbow joint, by Act. Asst. Surg. J. Brookes.	Necrosed bone came away; gangrene; permanent anchylosis. Disch'd May 28, 1863; pens'd. Arm partially paralyzed.
49	Whitten, W., Pt., H, 121st Ohio, age 22.	Sept. 20, 1863.	Complete anchylosis; dense mass of callus surrounding joint after a shot fracture of the left elbow.	April 2, 1864.	Two inches of bone from each extremity being sawn thro' at site of original joint, thro' Moreau's incision, by Donald Macleam, M. D.	Erysipelas; motion of forearm, except slight difficulty in supination, perfect. Disch'd Oct. 8, 1864; Pension Examiner reports arm useless.

§ *Fatal Secondary Excisions at the Elbow.*—The proportion of fatal terminations in the series of secondary excisions at the elbow was small; and appears the more remarkable when it is considered that in one or two instances death resulted less from the local mutilations than from the constitutional conditions. The five operations of this group were on the right elbow in one, and on the left in four instances; four were complete or nearly complete, and one a partial excision; all the patients were Union soldiers; one died after submitting to consecutive amputation for gangrene. Abstracts of two of the cases,

which are represented in the Museum by pathological specimens, are subjoined; the second is the only one of the fatal cases accompanied by a necroscopical record:

CASE 1826.—Private A. R. Davis, Co. F, 102d Pennsylvania, aged 28 years, was wounded at the Wilderness, May 5, 1864. Surgeon S. F. Chapin, 139th Pennsylvania, recorded his admission to the field hospital of the 2d division, Sixth Corps, with "a gunshot wound of left arm." The patient was sent to Washington, whence Surgeon G. L. Pancoast, U. S. V., in charge of Finley Hospital, performed excision of the elbow joint, and described the operation as follows: "The patient was admitted May 13th, with gunshot fracture of left elbow joint, the ball entering the anterior part, passing directly upward and backward. The joint was opened, the parts became much swollen, and anchylosis was taking place rapidly. June 17th, excision was performed, under chloroform, by an incision about five inches in length, a portion of the ends of the radius, ulna, and humerus being taken out. June 30th, patient has been doing very well. Water dressings were applied, and afterward emollient poultice. Death took place on August 22, 1864. The immediate cause of death was diarrhœa. The excised bones of the joint, represented in the annexed cut (FIG. 649), were contributed to the Museum by the operator, and embrace the head and one inch of the shaft of the radius, six fragments representing two inches of the extremity of the humerus, and the upper part of the ulna. The specimen has slight osteophytic deposits upon it, and the articular surfaces are more or less carious.

FIG. 649.—Excised part of elbow. *Spec.* 2583.

CASE 1827.—Private A. N. Perkins, Co. K, 2d Connecticut Heavy Artillery, aged 35 years, was wounded at Cold Harbor, June 1, 1864, and admitted to the field hospital of the 1st division, Sixth Corps, where Surgeon R. Sharpe, 15th New Jersey, noted: "A gunshot wound of the left elbow." On June 7th, the wounded man entered Lincoln Hospital, Washington, and four days afterward he was transferred to Patterson Park Hospital, Baltimore, where he underwent excision of the elbow joint. Acting Assistant Surgeon G. W. Fay, who performed the operation, furnished the minutes of the case as follows: "The ball entered near the external condyle of the humerus and lodged in the joint. The missile was removed soon after admission. June 30th, patient suffers very much from great swelling and inflammation of arm, and has a bed-sore over the sacrum. Made an incision in the arm near the elbow, which discharged about a pint of pus. Applied bread and milk poultice, and prescribed tincture of muriate of iron, fifteen drops three times a day. July 16th, the swelling and inflammation is so much diminished as to admit of an operation. Administered chloroform, and exsected from lower part of humerus two and a half inches, and from the radius and ulna each one and a half inches. Made a vertical incision about seven inches long. August 1, patient suffers much from bed-sore, which is more weakening than the wound itself. The incision is nearly healed. Patient has stealthily procured and eaten unripe pears, causing pain and vomiting followed by diarrhœa. August 3d, had two chills to-day, one in the forenoon and the other past noon. Prescribed two grains of sulphate of quinine thrice daily. August 9th, chills are arrested; there is now pain in right side of chest, with a cough. Prescribed a mixture with squills. August 11th, pain in right breast continues; dullness on percussion over right lung; pulse rapid; cough. Expectorates a thick tough mucus. Ordered a prescription of sulphate of morphia two grains, diluted hydrocyanic acid ten drops, syrup of squills one-half ounce, and mucilage of gum arabic two ounces, to be given in teaspoonfuls every four hours. August 12th, patient very feeble; former symptoms continue; alternate cold sweats and paroxysms of fever; administered stimulants. August 13th, patient died. Autopsy: On opening the chest, the right pleural cavity was found to contain about thirty-four ounces of yellowish serum. The lower lobe of the right lung was congested, and a large ulcer near its apex had discharged pus into the thoracic cavity. There was also a small ulcer at the apex of the left lung. The examination of the arm at the seat of operation disclosed that the lower end of the humerus had become deprived of periosteum, subsequent to the operation, for a space of about one and a half inches. This part had become encased with an osseous substance, which completely protected it from the soft parts. In other respects all parts adjacent to the operation had healed favorably." The excised bones of the elbow joint were contributed to the Museum by the operator, and show (FIG. 3, PLATE LI, *opposite* p. 872) the articular surfaces to be destroyed by suppuration. The line of section in the shafts of the bones of the forearm are very oblique. The outer condyle and head of radius had been fractured and were removed. In the specimen the olecranon has been divided.—*Cat. Surg. Sect.*, 1866, p. 156, *Spec.* 3466.

TABLE CXIII.

Summary of Five Fatal Cases of Secondary Excision at the Elbow for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Davis, A. R., Pt., F, 102d Pennsylvania, age 28.	May 5, 1864.	Shot wound through left elbow.	June 17, 1864.	Excision, by Surg. G. L. Pancoast, U. S. V. See CASE 1826, p. 891.	Died August 21, 1864. *Spec.* 2583.
2	Jones, W., Pt., G, 77th Pennsylvania, age 32.	Aug. 5, 1864.	Fracture upper third left radius, Joint involved, by conoidal ball.	Sept. 10, 1864.	Excision of four inches upper end of radius thro' straight incision, by Surg. S. H. Kersey, 36th Indiana.	Gangrene. November 14, 1864, arm amputated. Died January 7, 1865, of chronic diarrhœa.
3	McReynolds, P. W., Pt., G, 57th Indiana, age 20.	June 23, 1864.	Shot wound of left elbow joint; joint opened; chronic dysentery.	July 29, 1864.	One and a half inches humerus, two inches ulna, three-fourths inch radius, by Asst. Surg. B. E. Fryer, U. S. A.	Died August 22, 1864, of chronic dysentery.
4	Perkins, A. N., Pt., K, 2d Conn. H. A., age 35.	June 1, 1864.	Canister shot wound of left elbow.	July 16, 1864.	Excision, by A. A. Surg. G. W. Fay. See CASE 1827, and FIG. 3, PLATE LI.	Died August 13, 1864. *Spec.* 3466.
5	Vanwarner, J., Pt., A, 7th New York H. A., age 24.	Oct. 30, 1864.	Shot wound of right elbow joint.	Dec. 16, 1864.	Ends of humerus and ulna removed by crucial incision, by Surg. G. L. Pancoast, U.S.V.	Died January 10, 1865, of pneumonia.

In the group of fifty-four secondary excisions at the elbow, as well as in the primary and intermediary series, Langenbeck's method,[1] by a single vertical incision, appears to have been the favorite mode of operating.

4. Excisions at the Elbow of Uncertain Date.—Fifty-three cases of resection at the elbow for shot injury were reported, in which either the dates of injury or of operation, or both, were unspecified, or that the interval between the two could not be computed. The terminations of five of the cases were not ascertained. Of the remaining forty-eight patients, five died, or 8.3 per cent., an exception to the ordinary rule that lists of operations imperfectly reported present a mortality rate higher than the average. From a fatal case, probably an early intermediary operation, a specimen was contributed:

FIG. 650.—Excised elbow. *Spec.* 202.

CASE 1828.—Private R. Phipps, Co. E, 30th Pennsylvania, aged 21 years, was wounded in the right elbow at Bull Run, August 30, 1862. He was admitted to Ascension Hospital, Washington, where the joint was excised. Surgeon J. C. Dorr, U. S. V., who performed the operation, reported that the patient died from "the effects of a gunshot wound of the arm" on September 20, 1862. The specimen, represented in the annexed wood-cut (FIG. 650), consists of two inches of the lower extremity of the humerus and the upper extremity of the ulna. The olecranon is badly fractured, a part of the trochlea is broken, and the articular surface of the greater sigmoid cavity and of the trochlea are deeply eroded; the outer condyle is intact, and shows but slight traces of disease. In the cut the extremity of the ulna is placed too far over on the radial side.

The forty-four recoveries, five undetermined, and four fatal cases are tabulated together. Twenty-seven operations, including the four fatal cases, were on the right side, nineteen on the left; in seven cases, this point is not noted. Thirty-one of the patients were Union, and twenty-two Confederate soldiers.

TABLE CXIV.

Summary of Fifty-three Cases of Excision at the Elbow Joint, of Uncertain Date, for Shot Injury.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Adams, B. C., Lieut., G, 4th Pennsylvania Cavalry.	Oct. 12, 1863.	Shot fracture of right elbow...	———	Excision of four or five inches of humerus.	Discharged March 16, 1864; pensioned. Arm useless.
2	Adams, J., Pt., K, 155th Pennsylvania, age 21.	May 5, 1864.	Wound of right elbow joint by conoidol ball.	1864.	Partial excision of right elbow joint.	Discharged November 2, 1864; pensioned. Arm atrophied; partial anchylosis of joint.
3	*Andrews, T.*, Serg't, A, 53d Georgia.	July 3, 1863.	Shot fracture of both condyles right humerus, olecranon process ulna, and head of radius.	1863.	Condyles of humerus, olecranon and head of radius, by Surg. J. J. Knott, 53d Ga.	Recovered with a useful limb. Died of typhoid fever and dysentery.
4	Bacon, M. A., Corp'l, K, 102d New York.	Sept. 17, 1862.	Wound of right arm, fracturing bone.	———	Excision of joint.....	Disch'd March 3, 1863; pensioned. Anchylosis of joint.
5	Baker, J., Pt., C, 102d New York.	Sept. 17, 1862.	Shot fracture of left elbow	1862.	Excision of joint.....	Discharged December 20, 1862; pensioned. Bony anchylosis.
6	*Beauchamp, J. N.*, Serg't, D, 3d Georgia S. S., age 19.	Nov. 19, 1863.	Wound of right elbow joint...	———	Excision of joint.....	Retired February 10, 1865.
7	Boehm, P., Lieut., 15th New York Cavalry, age 20.	April 1, 1865.	Wound of right elbow joint...	1865.	Excision of joint.....	Wound healed; good prospect of useful arm. Not a pensioner.
8	*Bracken, R.*, Lieut., B, 2d Louisiana.	———	Wound of elbow.....	———	Excision of joint.....	Transferred July 18, 1863.
9	Bradford, R. J. K. P., Pt., B, 2d Wisconsin.	July, 1863.	Wound of left elbow joint.....	1863.	Resection	Discharged November 27, 1863; not a pensioner.
10	Brown, G., Captain D, 20th New York State Militia.	Aug. 30, 1862.	Shot fracture of right ulna by musket ball.	———	Excision of four inches of ulna, including articulation, by Surgeon O. A. Judson, U. S. V.	To V. R. C. Dec. 21, '63. Re-enlisted, and was discharged in 1869. Anchylosis of elbow and wrist joints; hand useless.
11	Coleman, J., Pt., G, 54th Massachusetts, age 23.	July 18, 1863.	Wound of right elbow joint by fragment of shell.	———	Excision of portion of humerus.	Disch'd May 13, 1864; pensioned. Limb dangles by his side.
12	*Collier, E.*, Lieut., B, 5th Texas.	———	Wound of left elbow	———	Excision of left elbow joint....	Retired November 27, 1864.
13	Courforth, C., Pt., I, 1st Pennsylvania Rifles.	Dec. 13, 1862.	Gunshot wound through left elbow joint by a conoidal ball.	———	Excision of portion of joint....	Disch'd June 3, 1863; pensioned. Anchylosis of joint; total loss of use of hand.
14	*Crowther, J. J.*, Pt., B, Orr's Rifles.	1864.	Wound of right arm.....	1864.	Excision of elbow.....	Died May 25, 1864.
15	Dickson, L., Pt., F, 6th Colored Troops, age 27.	Sept. 29, 1864.	Fracture of right arm by conoidal ball.	———	Excision of lower end of humerus.	Discharged April 28, 1865; pensioned. No union; forearm hangs loosely at side.

[1] In 25 of the secondary excisions in which the mode of operating was specified, the method by a straight vertical incision was adopted in 15,—MOREAU'S H-shaped incision in 2,—a crucial incision in 3,—LISTON'S ⊣-shaped incision in 1,—a T-shaped incision in 2,—V or U-shaped incisions in 2.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
16	*Diemburger, G.*, Pt., F, 1st Maryland, age 23.	———	Gunshot wound through left elbow joint.	———	Excision of joint.....	Union; anchylosis of joint. Fell and produced a second fracture. Transferred January 15, 1864.
17	Doyle, J., Pt., I, 10th Ohio, age 28.	Oct. 8, 1862.	Fracture right humerus at lower third, involving elbow joint.	———	A great portion of external condyle removed.	Discharged May 2, 1863; pensioned. Joint anchylosed; grasp of hand much enfeebled.
18	*Everhart, J.*, Pt., C, 1st Tennessee Cavalry, age 41.	July 29, 1864.	Fracture of lower third of right humerus.	———	Partial; removing distal extremity of humerus.	Retired Feb. 10, 1865, on certificate of permanent disability.
19	Fical, H., Corp'l, F, 97th New York.	Aug. 29, 1862.	Wound through right elbow and of abdomen by same ball.	1862.	Excision of joint.....	Disch'd Dec. 21, 1862; pensioned. Arm reduced in size; complete anchylosis at right angle.
20	Gaffaly, L., Pt., D, 62d New York, age 18.	May 2, 1863.	Compound fracture of left ulna, separating olecranon process, by a conoidal ball.	———	Excision of one inch and a half of upper portion of ulna.	Disch'd Feb. 25, 1864; pensioned. Firm anchylosis at right angle; osseous tissues in carious condition (1867).
21	*George, J. D.*, Pt., C, 36th Virginia, age 18.	June 5, 1864.	Conoidal ball through left elbow joint, almost separating outer condyle of humerus from shaft.	1864.	Two and a half inches extremity of left humerus.	Erysipelas. Retired December 3, 1864. Loss of use of arm.
22	Gorman, J. O., Pt., E, 19th Michigan, age 30.	Mar. 5, 1863.	Fracture of left radius and ulna.	1863.	Six inches upper end of radius and five and a half of ulna, one and a half inches from joint.	Disch'd July 22, 1863; pensioned. Arm shortened five inches; perfectly useless and in the way.
23	Grinnell, W., Lieut., I, 104th Ohio, age 24.	Nov. 29, 1863.	Wound of left elbow joint by conoidal ball.	———	Portion of radius and condyle of humerus, thro' T incision.	Disch'd June 3, 1864; pensioned. Arm useless; completely anchylosed.
24	*Gunter, E.*, Pt., F, Palmetto Sharpshooters.	Sept. 30, 1864.	Wound of left elbow joint.....	———	Excision of joint.....	Furloughed October 28, 1864.
25	*Hammock, S. L.*, Pt., A, 3d Georgia Cavalry.	July 21, 1864.	Wound of right elbow joint...	———	Excision of joint.....	Retired March 7, 1865. Arm powerless.
26	*Hand, A. J.*, Pt., D, 19th Georgia.	———	Shot wound of left elbow.....	———	Excision of elbow.....	.....
27	*Helms, G. M.*, Lieut., A, 24th Virginia.	1864.	Wound of left elbow.....	May 16, 1864.	Excision.....	.....
28	*Hendricks*, —, Pt., C, 53d Georgia, age 17.	1864.	Fracture of right elbow joint..	———	Both condyles and olecranon, through longitudinal incision, by Surg. J. J. Knott, 53d Ga.	Recovered with a useful limb.
29	Hoffman, J., Corp'l, G, 119th New York, age 36.	July 1, 1863.	Wound of right elbow joint....	———	Both condyles of humerus and olecranon process of ulna.	Disch'd Feb. 17, 1864. Jan. 29, 1873, complete anchylosis; arm useless.
30	Hoops, G. W., Pt., E, 98th Ohio.	July 19, 1864.	Wound of left elbow joint, fracturing inner condyle.	———	Excision of inner condyle.....	Disch'd July 3, 1865; pensioned. Partial anchylosis of joint; arm weakened.
31	Hoover, W. G., Pt., G, 14th Ohio.	Nov. 25, 1863.	Shot fracture of right elbow joint.	1863.	Excision of elbow joint.....	Died March 9, 1864.
32	Houston, J., Pt., F, 55th Pennsylvania, age 29.	June 15, 1864.	Wound of right elbow joint by a shell.	———	Two and a half inches of humerus and one and a half of ulna, through straight incision.	Disch'd March 16, 1865; pens'd. Arm hangs powerless.
33	*Higgins, C. P.*, Pt., C, 13th South Carolina.	Aug. 16, 1864.	Wound of elbow joint.....	———	Excision of joint.....	.....
34	*Jones, E. P.*, Serg't, D, 3d South Carolina Battery.	July 28, 1864.	Wound of right elbow joint...	———	Excision of ulna at elbow joint.	.....
35	Kauffman, J. K., Pt., E, 21st Ohio.	Sept. 19, 1863.	Caries after shot wound of right elbow joint.	1863.	Lower third of humerus, involving elbow joint.	Died from hepatatis October 27, 1863.
36	*Leutz, F.*, Pt., B, 8th Georgia.	———	Wound of elbow.....	———	Excision of elbow.....	Discharged December 30, 1861.
37	*Long, J.*, Pt., F, 11th North Carolina, age 27.	Aug. 21, 1864.	Wound of elbow joint.....	———	Excision of joint.....	Retired February 21, 1865. Anchylosis.
38	*Major, D. K.*, Pt., L, Orr's Rifles.	May 5, 1864.	Wound of right elbow.....	———	Excision.....	.....
39	Maguire, J., A, 1st U. S. Mounted Rifles.	Oct. 3, 1862.	Fracture of ulna, involving elbow joint.	———	Excision of three inches of ulna.	Forearm flexed on arm; joint completely anchylosed. Discharged; not a pensioner.
40	Millet, C. H., Pt., L, 1st Pennsylvania Cavalry.	———	Wound of left elbow joint....	———	Resection of joint.....	Disch'd May 14, 1865; not a pensioner.
41	Negele, W., Pt., H, 55th Ohio, age 27.	Aug. 30, 1862.	Fracture of head of left radius.	———	Excision of two or three inches of radius, including head.	Disch'd Jan. 27, 1863; pensioned. Permanent anchylosis; partially flexed.
42	*O'Gready, J.*, Pt., B, 2d Louisiana.	———	Wound of elbow.....	———	Excision of joint.....	Transferred July 18, 1863.
43	*Piper, A.*, Serg't, B, 53d Georgia.	June 1, 1864.	Fracture, opening right elbow joint.	———	Excision, with removal of olecranon, through longitudinal incision, by Surg. J. J. Knott, 53d Georgia.	Complete anchylosis of elbow.
44	Phipps, R., Pt., E, 30th Pennsylvania.	Aug. 30, 1862.	Shot fracture of right elbow...	Sept., 1862.	Excision, by Surg. J. C. Dorr, U.S.V. See CASE 1828, p. 892.	Died September 20, 1862. *Spec.* 202.
45	Reynolds, A. J., Pt., K, 19th Kentucky, age 49.	———	Fracture of left elbow.....	———	Excision of entire elbow joint.	Disch'd Oct. 13, 1863; pensioned. Arm useless. Died Dec. 27, '71.
46	Shauf, H., Corp'l, K, 42d Ohio, age 22.	May 22, 1863.	Fracture of right elbow by grapeshot.	———	Excision of entire elbow joint.	Disch'd Nov. 7, 1864; pensioned. Complete anchyl's and atrophy.
47	*Sisnerson, S. E.*, Pt., A, 54th North Carolina, age 18.	May 10, 1864.	Wound of left elbow joint....	1864.	Excision of joint.....	Discharged December 30, 1864.
48	*Stringfield*, —, Pt., A, 4th Texas.	———	.....	———	Excision of elbow joint.....	Transferred September 25, 1863.
49	Unknown, 1st Serg't, —Pennsylvania, age 25.	May 3, 1863.	Fracture of both condyles of left humerus by a musket ball.	1863.	Both condyles, olecranon process, and head of radius, thro' longitudinal incision, by Surg. J. J. Knott, 53d Georgia.	Fair prospect of recovery with a useful limb.
50	Weitershausen, C. R., Pt., B, 9th Pa. Reserves, age 21.	June 30, 1862.	Wound of right forearm and elbow joint by musket ball.	1862.	Three inches of bones forming joint excised.	Disch'd Sept. 27, 1862; pensioned. Arm hangs useless.
51	Weller, W. J., Pt., E, 78th Ohio, age 20.	May 16, 1863.	Left elbow joint crushed by ball.	1863.	Resection of almost entire joint, by Surg. E. L. Hill, 20th Ohio.	Disch'd Oct. 16, 1863; pensioned. Power of arm greatly impaired.
52	Weston, C. J., Pt., I, 7th Infantry, age 19.	July 2, 1863.	Fracture of right elbow by minié ball; also wound of left knee Dec. 13, 1862.	1863.	Excision of portion of elbow..	Discharged July 9, 1864. Use of arm permanently impaired.
53	Wilkins, N., Pt., D, 99th Illinois, age 22.	May 17, 1863.	Fracture of right elbow joint..	———	Excision of entire joint.....	Disch'd Oct. 13, 1863; pensioned. Some use of fingers if arm is assisted.

Further facts regarding the fifty-three excisions at the elbow of uncertain date are summed up in the foot-note.[1]

RECAPITULATION.—In the eight preceding tabular statements, six hundred and twenty-six cases of excisions at the elbow on account of the immediate or remote effects of shot injury have been enumerated and the result recorded except in ten instances. Among the six hundred and sixteen cases, there were one hundred and forty-two deaths, or a mortality of 23.7 per cent., or one-tenth of one per centum greater than the fatality of the series of amputations in the upper arm. The extent of the resections in the several groups is set forth in the subjoined table, which indicates very clearly that, upon an average, the more complete excisions were the least hazardous to life:

TABLE CXV.

Statement of the Parts Excised in Six Hundred and Twenty-six Instances of Excisions at the Elbow for Shot Injury.

The increasing relative frequency with which the operation was resorted to as the war progressed, has been adverted to on page 846, in treating of the primary excisions. TABLE CXVI shows that this remark applies to each of the groups, and that the results were perhaps less favorable toward the close.

[1] Of the 44 patients who recovered 30 were discharged, and 22 of these were pensioned; 5 returned to modified duty, and 9 were exchanged or furloughed. Three patients (CASES 3, 6, and 28, of TABLE CXIV) are reported to have recovered with useful arms, 7 with partial mobility, 15 with complete anchylosis, 2 with partial anchylosis, 6 with useless arms, and the results in 11 cases are not specified. The method of operating was specified in 6 instances only,—straight incision in 5, and T-shaped in 1.

The period of the year in which the operation was practised was ascertained in over eleven-twelfths of the cases. It appears from the figures in the following table that more than half of the operations were done in the warm months of May, June, and July, with a death-rate of 27.4 per cent., or rather higher than the average.

In three-fourths of the cases the ages of the patients were recorded, and the results apparently indicate that the operation was borne better by the younger men of military age; but in the one hundred and thirty-one cases in which the age was undetermined the death-rate is sufficiently high to counterbalance this proportion in favor of the younger men, provided it be assumed that a majority of the undetermined class belonged to the groups of patients under thirty years. Without such assumption the figures are consistent with the doctrine that surgical interference is more hazardous to life as age advances.

Excisions at the Elbow in the Confederate Service.—I am under a large debt of obligation, in which every student of the subject will share, to Dr. Howell L. Thomas,[1] of Richmond, Virginia,[1] for the use of the register of cases of resection compiled by him from the records of the military hospitals and files of the Surgeon General's Office, in Richmond. This register comprises memoranda of one hundred and eighty-four operations of excision at the elbow. Forty-six of these were found to be identical with cases included in the preceding tables.[2] A summary of the facts ascertained regarding the remaining one hundred and thirty-eight cases is presented in the succeeding tabular statement.[3] Detailed abstracts of a few cases are subjoined, examples being selected of the seven varieties of the operation usually recognized, viz: the resection of the joint ends of the three bones,—of the ends of the humerus and ulna,—of the humerus and radius,—of the articular extremity of the humerus alone,—of the ends of the ulna and radius,—of the ulna alone,—and of the radius alone. The joint ends of the three bones were excised in the first case:

Case 1829.—"Private *G. W. Collins*, Co. B, 40th Georgia, aged 28 years, was wounded November 25, 1863, the ball entering two inches below the elbow joint, passing upward and forward, fracturing the articular ends of the bones forming the elbow joint, and making its final exit through the pectoral muscles. The injury resulted in anchylosis. On March 14, 1864, Surgeon J. C. Logan, of Cassville, Georgia, made an H-shaped incision on the posterior aspect of the elbow and sawed off the articulating ends of the humerus, ulna, and radius. On April 1st the patient was doing quite well; the wound was still suppurating freely; there was considerable motion in the joint, with healthy granulations at the wound."

In the two following cases, the humero-cubital and humero-radial articulations, respectively, were resected:

Case 1830.—"Private *C. H. Perry*, Co. D, 11th Georgia, aged 17 years, was wounded July 2, 1863, the ball entering half an inch above the angle of the elbow and emerging an inch below the angle on the inner side of the external condyle. Surgeon J. L. Cabell reported that a resection of the elbow was made on July 20th, by a longitudinal incision extending two inches above and below the point of the elbow, a few lines to the outer side of the ulnar nerve, and a transverse cut crossing to the external condyle, making a T-shaped incision. Three-fourths of an inch of the inferior articular extremity of the humerus, the olecranon process, and the head of the ulna were removed. The operation was followed by considerable fever, which passed off on the fourth day. The arm was first placed upon a wire splint, and on July 23d was supported on a pillow until August 1st. Cold applications were continuously employed, and ice for several days. Early in August he could move and raise the arm without pain. The flaps of the transverse incision had retracted from a quarter to a third of an inch only, and those of the longitudinal cut from a half to three-fourths of an inch, the interspaces being filled by healthy granulations. In August, the record states: 'Arm has continued to improve with the exception of an accidental injury. The transverse incision has cicatrized except at its external angle, and the vertical incision for half its length. The patient can flex the forearm on the arm so as to bring the hand to his mouth, and can make partial pronation and supination.'"

Case 1831.—Private *S. M. Taylor*, Co. I, 2d Louisiana, aged 24 years, formerly a farmer, was wounded at Sharpsburg, July 2, 1863, in the left elbow. Surgeon W. C. N. Randolph reported from Lynchburg that: "The ball entered the posterior portion of the elbow, passed obliquely forward and outward, fractured the external condyle, and opened the joint. The patient did well until August 8th, when disorganized synovial fluid was discharged from the anterior orifice and serous effusions commenced in the tissues covering the joint, which increased daily, until the joint was three times its natural size. On August 12, 1863, resection was performed by Moreau's method, removing two and a half inches of the inferior articular extremity of the humerus, a portion of the head of the radius, and incrusting cartilage of the articular surface of the ulna and radius, the cartilage being removed by the rongeur. The soft parts were then brought together with silver sutures; the arm was bent at an obtuse angle and placed on a pillow, and the wound was treated by continuous irrigation for four days. By this time the serous effusion and swelling had in a great measure subsided and the general condition of the patient was good. He steadily improved, and recovered with limited motion of the joint."

---

[1] The painstaking and conscientious statistician whose very important contribution to the history of excisions at the shoulder for shot injury was presented (at pp. 660–667) in the Third Section of this Chapter.

[2] The patients having either been treated in Union hospitals, or entered on records delivered to the United States at the conclusion of the War.

[3] These results have the greater value since little can be learned from other sources of the results of excisions of the elbow by the Confederate military surgeons. In an extract from an official Report of the Sickness and Mortality in the Armies of the Confederate States for 1863 (*Confederate States Med. and Surg. Jour.*, Oct., 1864, Vol. I, p. 155), Surgeon F. Sorrel, C. S. A., inspector of hospitals, presents a table said to "exhibit the general results of . . . resections thus far collected and carefully prepared from reports throughout the Confederacy." This table includes 54 excisions at the elbow, the result as to fatality determined in each instance. Of 25 primary excisions, 3 were unsuccessful; of 29 secondary excisions, 6 were unsuccessful. Seven patients recovered with useful joints. Surgeon General L. Warren, of North Carolina, published (*Epitome of Pract. Surg.*, 1863, p. 299) a "Consolidated Table of Capital Operations performed in and around Richmond from June 1st to August 1, 1862," which comprises 6 excisions at the elbow—a fatal primary case; 2 intermediary cases, of which 1 recovered; 3 secondary cases, of which 1 recovered. Chisolm (J. J.) (*A Manual of Mil. Surg.*, 3d ed., Columbia, 1864, p. 377) gives a consolidated table of resections, collated from records in the Surgeon General's office at Richmond, from June 1, 1862, to February 1, 1864, by Surgeon H. Baer, P. A. C. S., which includes 54 excisions at the elbow, and in every particular, except the period said to be covered by the return, appears to be identical with that of Inspector Sorrel. In a *Report on Wounds of Large Joints*, made to the *Confed-*

Of ninety-two operations in which the parts removed are specified, fifteen were complete excisions in the strict anatomical sense, the articular extremities of the three bones having been removed. In nine, the humero-cubital joint ends were removed; in one, the humero-radial; in eight, the upper ends of the ulna and radius; in twenty-one, the upper extremity of the ulna alone; and in nine, the head of the radius. Forty-six other operations, reported as exsections of the elbow joint, or by equivalent terms, comprise, doubtless, a fair proportion of complete excisions. The three foregoing cases illustrate the first three groups, the four following abstracts exemplify the more partial excisions:

CASE 1832.—"Private *H. L. Ballow*, Co. A, 16th Alabama, aged 28 years, was wounded on September 20, 1863, receiving a ball in the lower end of the humerus. On October 6th, the fractured lower extremity of the humerus was excised by Surgeon S. E. Chaillé, P. A. C. S. The patient did well, and was furloughed December 22, 1863."

CASE 1833.—"*A. H. Traylor*, Co. D, 5th Texas, aged 21 years, was wounded September 21, 1863, and reported by Surgeon Charles E. Michell, of Marietta, as having received a gunshot wound of the right arm, with a portion of the elbow joint excised. The head of the radius and articular portion of the ulna were removed on the day of the injury, the operation being done on the field, by longitudinal incision. November 30, 1863, the patient is doing well, and the incision is nearly healed."

CASE 1834.—"Private *D. Herren*, Co. F, 48th Mississippi, aged 28 years, was wounded May 12, 1864, *vulnus sclopeticum* of right elbow joint, with fracture of the coronoid process of the ulna. Surgeon A. G. Lane performed a resection of the articular extremity of the ulna soon after the injury. On June 30th, the patient was doing well; on July 20, 1864, he was furloughed, the incision having nearly healed."

CASE 1835.—"Lieutenant *A. S. Erwin*, of Phillips's Legion, received a shot wound near the elbow September 20, 1863, at the battle of Chickamauga. Surgeon W. F. Westmoreland, P. A. C. S., performed resection of the head of the radius, on the field, the day of the injury. On Oct. 11th, the patient had an attack of hæmorrhage, which was suppressed; he made a good recovery."

The result as to fatality, determined in one hundred of the hundred and thirty-eight cases of this series as 19 per cent., is far more favorable than that indicated by the returns already discussed, a result to be anticipated in view of the circumstances under which the cases of this series were collected.[1] The ratios in which the various methods of operating and the several periods for operation were selected, approximate closely to the corresponding proportions in the Union returns. There was, also, apparently the same uniformity in the methods of after-treatment. There is frequent mention in the abstracts of placing the limb after operation upon "a well-padded angular splint," or upon "a tin trough splint" (possibly Bond's splint,[2] FIG. 651), and of "keeping the arm flexed at an obtuse angle of 130° or 140°." The use of cold irrigation or of ice-bags is so often alluded to that it is probable that this resource was employed more generally, in this class of cases, than in the Union hospitals. The importance of early passive motion, commenced as soon as suppuration is diminished and before cicatrization is complete, is referred to by several reporters. Repeated declarations are met with in favor of complete resections in preference to removal of the parts only of the articulation injured; although this rule, seemingly accepted in theory, was often disregarded in practice. The most important recorded facts of each of the one hundred and thirty-eight cases are condensed in the succeeding tabular statement.

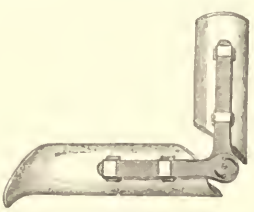

FIG. 651.—Bond's elbow splint.

erate States Association of Navy and Army Surgeons, and published in the *Southern Medical and Surgical Journal* for 1866, Vol. XXI, p. 203, Dr. J. B. READ, of Savannah, publishes a list of resections of the elbow from the files of the Confederate Surgeon General's office, making the whole number 45 cases: 22 primary *with* 3 deaths, and 23 secondary *with* 6 deaths. This is obviously an erroneous version of Dr. SORREL'S table, the 9 fatal cases being deducted from the successful series instead of being added to them. Dr. READ misinterprets his 22 primary operations with 3 deaths as giving a death-rate of 35, instead of 13.6 per cent., and the 23 secondary operations with 6 deaths as having a mortality ratio of 20, instead of 26.6 per cent. The *Manual of Military Surgery, prepared for the use of the Confederate States Army by order of the Surgeon General*, Richmond, 1863, gives instructions for performing the operation, from M. CHASSAIGNAC and Professor PIRRIE, and recognizes partial excisions as proper when only a portion of the joint is injured; but does not refer to any observed results.

[1] Many mutilated soldiers assembled at Richmond either to await the action of retiring boards, to procure apparatus, or to seek for employment; hence observations on amputations and resections at that centre are liable to show a larger proportion of recoveries than the just average.

[2] BOND (H.), *Description of a new Splint for Dressing Diseases and Injuries of the Elbow Joint*, in *Am. Jour. Med. Sci.*, 1857, Vol. XXXIV, p. 344. This splint is manufactured by Gemrig, 109 South Eighth street, Philadelphia.

TABLE CXIX.

Summary of One Hundred and Thirty-eight Cases of Excisions at the Elbow after Shot Injury, practised in the Confederate Army.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	*Allen, J. H.*, Pt., G, 34th Alabama, age 31.	July 28, 28, '64.	Right; joint through V incision.
2	*Allen, O.*, Pt., G, 14th Alabama.	May 3, 3, '63.	Fractured portion. July 15, tumefaction and suppuration dimin'g.
3	*Baggott, R.*, Pt., H, 20th North Carolina.	May 19, 20, '64.	Resection of elbow joint.
4	*Ballard, G. W.*, Pt., H, 5th Alabama, age 23.	May 5, 22, '64.	Left; joint through T incision. Died June 19, 1864.
5	*Ballow, H. L.*, Pt., A, 16th Alabama, age 21. See CASE 1832, p. 895.	Sept. 28, Oct. 6, '63.	Excision of fractured end of humerus. Furloughed Dec. 22, '63.
6	*Bell, D. F.*, Pt., H, 12th Virginia Cavalry.	June 9, Jul. 19, '63	Left; three inches lower end of humerus. Furl'd Nov. 9, 1863.
7	*Brendle, G. S.*.....	———	Excision of elbow joint. Died of pyæmia.
8	*Brock, M. E.*, Lieut., B, 1st Florida Cavalry.	July 1, 1, '64.	Left; condyles and olecranon process.
9	*Butler, J. T.*, Pt., K, 36th Georgia, age 18.	July 21, 21, '64.	Excision of elbow joint.
10	*Cahill, W. H.*, Pt., F, 7th Virginia Cavalry.	——— Mar. 19, 1863.	Right: articulating extremities of bones through U incision. Recovered promptly.
11	*Caig, N.*, Pt., G, 55th Alabama, age 21.	July 20, 21, '64.	Excision of right elbow joint. Sent to hospital.
12	*Caldwell, J. W.*, Pt., E, 44th Georgia, age 19.	May 3, 3, '63.	Right; portions of humerus, radius, and ulna. Furl'd June 17, '63.
13	*Cannon, T. J.*, Pt., G, 53d Georgia.	May 6, 18, '64.	Left; joint excised thro' straight incision. Furl'd July 29, 1864.
14	*Carper, J.*, Pt., C, 36th Virginia, age 19.	June 7, 12, '64.	Left; portions of humerus, radius, and olecranon. Furl'd Sept. 5, 1864. Considerable motion.
15	*Caskie, J. D.*, Pt., D, 1st South Carolina, age 40.	May 6, 1864.	Excisions of heads of radius and ulna. June 23, doing well.
16	*Chester, J. W.*, Capt., E, 3d Alabama.	Sept. 19, Oct. 4, '64.	Left; outer condyle of humerus. Died October 12, 1864.
17	*Clements, D. F.*, Pt., K, 41th Georgia, age 22.	May 30, 1864.	Left; inner condyle of humerus. Furloughed July 31, 1864.
18	*Clements, J. T.*, Serg't, F, 46th Georgia.	June 20, 1864.	Excision of head of radius.
19	*Cockrell, R. H.*, Pt., I, 6th Virginia, age 28.	May 12, 13, '64.	Excision of two and a half inches of ulna, including olecranon.
20	*Collins, G. W.*, Pt., B, 40th Georgia, age 28. See CASE 1829, p. 894.	No. 25, '63 Mar. 14, 1864.	Excision of articulating surfaces of bones of elbow thro' H incision. April 1, doing well.
21	*Conroy, M.*, Pt., D, 15th Louisiana, age 36.	Aug. 30, 31, '62.	Excision of joint. Recovered.
22	*Cooksey, J. D.*, Pt., D, 1st South Carolina, age 37.	May 6, 6, '64.	Right; through H-shaped incis'n; typhoid fever. June 30, still under treatment.
23	*Coughman, D. T.*, Pt., F, 15th South Carolina.	July 2, Aug. 21, 1863.	Left; olecranon process, head of radius, and one inch of lower articular end of humerus. Recovered; very fair use of limb.
24	*Credille, J. M.*, Lt., F, 4th Georgia.	Nov. 22, 24, '64.	Left; head of ulna and internal condyle of humerus.
25	*Davis, A. T.*, Corp'l, H, 1st South Carolina, age 22.	May 5, 1864.	Olecranon, head and three inches of ulna, and one-half inch of head of radius. July 31, joint anchy'd.
26	*Davis, J. J.*, Serg't, G, 47th Tennessee, age 35.	July 26, 26, '64.	Right; excision of joint. Died August 14, 1864.
27	*Dunlop, L. D.*, Pt., E, 19th South Carolina, age 20.	Aug. 31, 31, '64.	Left; condyles of humerus, head of radius, and olecranon, through H incision.
28	*Ellis, A.*, Lieut.-Col., 34th N. C., age 36.	Sept. 19, 19, '64.	Excision of elbow joint.
29	*Elmore, V. S.*, Pt., K, 46th Virginia, age 22.	June 17, 17, '64.	Right; excision of joint.
30	*Erwin, A. S.*, Lieut., Phillips' Legion. See CASE 1835, p. 895.	Sept. 20, 20, '63.	Excision of head of radius. Oct. 11, hæmorrhage; recovered.
31	*Forster, W. M.*, Corp'l, D, Palmetto S. S.	May 6, 6, '64.	Left: excision of joint. June 22, doing well.
32	*Foster, G. W.*, Pt., I, 4th Texas, age 27.	Oct. 7, 8, '64.	Right; excision of joint. Furloughed November 20, 1864.
33	*Frazier, S. W.*, Pt., G, 2d Mississippi, age 28.	July 3, 26, '63.	Left; two inches of head of ulna. Recovered.
34	*Freeman, W. J.*, Serg't, D, 16th Va., age 31.	July 30, 1864.	Right; elbow joint and one inch of humerus. Died Aug. 29, 1864.
35	*Friday, J. C.*, Pt., C, 4th Alabama.	May 6, 6, '64.	Left; condyle and three inches of ulna.
36	*Furguson, W. C.*, Pt., I, 19th Arkansas, age 29.	July 2, 1864.	Right; ulna and inner half of humerus, thro' H-shaped incision.
37	*Gasque, W. B.*, Pt., A, 21st S. C., age 21.	Aug. 21, 1864.	Right; excision of elbow joint. Doing well.
38	*Gauett, W. E.*, Pt., E, 20th Mississippi, age 18.	July 23, 23, '64.	Right; excision of joint. August 31, doing well.
39	*Greenlaw, H. C.*, Pt., F, 5th Arkansas, age 20.	Sept. 19, 19, '64.	Right; head of radius and ulna.
40	*Gregory, J. F.*, Pt., B, 39th N. C., age 27.	Dec. 31, 1862, Jan. 5, 1863.	Head of ulna and part of inner condyle of humerus, by Surg. R. Battey, P. A. C. S. February 13, arm amputated.
41	*Griffin, W.*, Pt., C, 35th Georgia.	June 22, 22, '64.	Excision of elbow joint.
42	*Griffin, W. A.*, Serg't, C, 2d Georgia.	Aug. 3, 11, '64.	Right; external condyle of humerus; gangrene.
43	*Gudding, F. G.*, Pt., H, 10th Alabama, age 21.	May 12, 13, '64.	Excision of elbow joint. Aug. 23, wound healed with fair motion.
44	*Guiger, H. H.*, Corp'l, B, 1st South Carolina, age 24.	May 6, 1864.	Left; head of radius and ulna, through straight incision. Aug. 6, good motion in joint.
45	*Haney, J. L.*, Serg't, C, 9th Tennessee.	Sept. 20, Oc. 14, '63.	Excision of humerus just above condyles. Mar. 1, '64, doing well.
46	*Hardwick, J. A.*, Pt., K, 44th Alabama, age 27.	Sept. 20, Oc. 19, '63	Excision of elb. joint; (gangrene.) Furloughed Nov. 26; doing well.
47	*Harper, E. G.*, Pt., I, 32d Tennessee, age 22.	June 22, 22, '64.	Condyles of humerus, three inches of ulna, and two inches of radius, through T incision.
48	*Hartman, A. F.*, Pt., C, 21st Mississippi, age 30.	———, Aug. 9, Second'y	Three inches of ulna and articular surfaces of radius and humerus. Recovery, useful joint.
49	*Herron, D.*, Pt., F, 48th Mississippi, age 28.	May 12, 1864.	Excision of ulna at elbow joint. July 30, furl'd; nearly healed. See CASE 1834, p. 895.
50	*Herener, H.*, Pt., G, 31st Virginia, age 24.	May 31, Jne 1, '64.	Excision of joint through straight incision. Recovery.
51	*Hickerson, J.*, Pt., B, 2d Arkansas.	July 22, 23, '64.	Right; condyles of humerus. Furloughed Oct. 6, 1864.
52	*Hill, J. T.*, Pt., A, 16th Georgia, age 21.	May 25, 1864.	Left; through T incision. Died July 8, 1864.
53	*Hill, W.*, Pt., H, 18th Georgia, age 19.	Oct. 19, 1864.	Left; excision of humerus at elbow joint. Jan. 1, '65, unfavorable.
54	*Hook, J. A.*, Pt., I, 28th Alabama, age 19.	Sept. 20, 20, '63.	Excision of elbow joint.
55	*Hopper, E. G.*, Serg't, I, 32d Tennessee, age 22.	June 22, 22, '64.	Left; excision of joint. Aug. 1, 1864, not doing well.
56	*Hoyle, J. C.*, Pt., A, 14th Alabama.	May 3, 3, '63.	Excision of elbow joint. Furloughed July 24, 1863.
57	*Hudson, J. H.*, Pt., I, 9th Va. Cav., age 22.	Oct. 14, 14, '63.	Left; excision of joint. Furloughed January 26, 1864.
58	*Huff, J.*, Pt., G, 45th Georgia, age 18.	May 5, 7, '64.	Left: through T-shaped incision. Recovery with fair motion.
59	*Hulse, J. V.*, Serg't, K, 6th Arkansas, age 26.	July 21, 21, '64.	Right; excision of joint. Aug. 31, doing well.
60	*Hurd, P.*, Sergeant-Major.	Sept. 19, Oc. 12, '63.	Right: lower end of humerus and olecranon. Nov. 30, doing well.
61	*Hurt, J. L.*, Pt., B, 3d Georgia, age 26.	June 5, 5, '64.	Excision of elbow joint. Furloughed August 3, 1864.
62	*Ingram, F.*, Pt., C, 49th Georgia, age 21.	May 6, 6, '64.	Excision of elbow joint. Recovery.
63	*Jenkins, E.*, Pt., K, 1st Virginia Cav., age 22.	May 14, 15, '64.	Left; excision of portions of bone. Died August 24, 1864.
64	*Johnson, D. J.*, Pt., E, 1st Alabama, age 44.	Sept. 19, Oct. 2, 1863.	Right; four and a half inches ulna, olecranon, and small portion outer condyle. Oct. 31, nearly healed.
65	*Jones, O.*, Pt., E, 3d Florida, age 45.	Sept. 20, Oct. 19, 1863.	Four inches of humerus, including articular extremity; hectic. Died October 26, 1863.
66	*Keen, W. L.*, Pt., F, 31st Georgia, age 27.	May 6, 6, '64.	Resection of joint. Recovered. Furloughed July, 1864.
67	*Lawton, B. T.*, Lieut., E, 11th S. C., age 32.	June 24, 24, '64.	Right; excision. Aug. 1, doing well.
68	*Lawyer, A.*, Pt., A, 11th Virginia Cavalry.	May 8, 1864.	Head and one-fourth inch of shaft of radius.
69	*Leatherwood, W. W.*, Pt., K, 2d Arkansas.	Nov. 24, Dec. 8, 1863.	Epitrochlea and all fragments of bone excised. Dec. 31, almost healed.
70	*Leonard, G.*, Pt., B, 63d Virginia, age 37.	Sept. 20, Oct. 5, 1863.	Four inches shaft of ulna, olecranon, and condyle, linear incision. Nov. 1, doing well.
71	*Leonard, J.*, Pt., D, 5th Confederate, age 24.	June 24, 1864.	Right; part of ulna, including olecranon.
72	*Little, E. P.*, Pt., I, 10th Alabama, age 21.	May 6, Jne 1, '64.	Right; excision of joint. Aug. 13, nearly well.
73	*Martin, G. W.*, Serg't, C, 19th Ala., age 48.	Sept. 20, Oct. 2, '63.	Olecranon and one inch of shaft, and spicular. Nov. 1, sloughing.
74	*Maxwell, A. J.*, Pt., I, 9th Texas.	Dec. 31, '62 Jan. 4, '63.	Two and a half inches of ulna. March 4, doing well.
75	*McCully, G.*, Capt., A, 54th Tennessee.	July 22, Au. 23, '64	Right; excision of elbow joint. Furloughed October 18, 1864.
76	*McGee, J. W.*, Pt., A, Hampton's L'n, age 19.	Aug. 30, Sep. 1, '62.	Excision of elbow joint. Died September 7, 1862.
77	*McGhee, M. M.*, Lieut., 2d Arkansas, age 27.	May 8, 11, '64.	Left; excision of olecranon process. Returned to duty.
78	*McLelland, R. C.*, Capt., D, 20th Mississippi.	July 2, 2, '64.	Excision of external condyle.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
79	*Meadows*, —, Pt., Virginia regiment.	June 2, 1864.	Excision of elbow joint; haemorrhage. Died June 11, 1864
80	*Mobley, J. H.*, Pt., D, 47th Georgia, age 27.	Sept. 20, Oct. 23, 1863.	Right; elbow joint; also spiculæ from ilium. Died November 10, 1863, of pyæmia.
81	*Mooney, J. W.*, Serg't, F, 13th Mississippi, age 25.	May 6, 6, '64.	Excision of joint. Furl'd July 11, 1864. Can use only thumb, middle, and index fingers.
82	*Moore, E. H.*, Pt., A, 2d Kentucky.	Sept. 20, Oct. 8, '63.	Resection of two inches of radius. November 24, arm amputated.
83	*Moore, R. R.*, Pt., H, 30th Georgia.	Sept. 20, 1863.	Resection of three inches of ulna, two inches of radius, and the condyles and one inch of humerus. Furloughed Nov. 26, 1863.
84	*Morris, N.*, Pt., H, 8th Georgia.	Nov. 22, 25, '64.	Right; external condyle of humerus.
85	*Moseley, J.*, Serg't, C, 35th Mississippi, age 31.	Aug. 11, 11, '64.	Left; articular ends and upper thirds of both bones. Died August 31, 1864, of pyæmia.
86	*Nall, M.*, Pt., A, 16th Mississippi, age 22.	Aug. 13, 13, '64.	Resection of right elbow joint.
87	*Nelson, A. J.*, Pt., H, 8th Arkansas, age 25.	Dec. 31, 1862. Jan. 5, 1863.	Left; olecranon and three and a half inches of shaft, thro' straight incision, by Surg. A. H. Snead. March 1, nearly healed.
88	*Newton, W.*, Pt., A, 4th Alabama.	Sept. 20, Oct. 6, 1863.	Right; elbow, four inches shaft of ulna, and olecranon. November 1, doing well.
89	*Nichols, E.*, Pt., D, 2d Florida, age 21.	Oct. 14, 14, '63.	Right; elbow, through a V flap. Furloughed December 9, 1863.
90	*Ogburn, J. M.*, Pt., B, 33d Alabama, age 22.	Sept. 20, Oct. 13, 1863.	Resection of olecranon, head of radius, and articular end of humerus through an L incision. Dec. 31, almost entirely healed.
91	*Owen, W. B.*, Chaplain, 17th Miss., age 30.	May 11, 11, '64.	Excision of left elbow joint.
92	*Perry, C. H.*, Pt., D, 11th Georgia, age 17. See Case 1830, p. 894.	July 2, 20, '63.	Resection of three-fourths of an inch of articulating end of humerus, olecranon process, and head of ulna thro' T incision.
93	*Pillgrimm, E.*, Pt., D, 44th N. C., age 40.	Oct. 14, Nov. 1, 1863.	Left; olecranon and head of radius. November 12, erysipelas. December 4, 1863, recovered.
94	*Plunkett, R.*, Lieut., K, 54th Virginia, age 30.	June 22, 22, '64.	Resection of elbow joint.
95	*Poindexter, W. W.*, S'g't, E, —, age 29.	May 14, 24, '64.	Resection of head of radius; complete anchylosis of joint.
96	*Powell, J. T.*, Lieut., G, 19th Virginia, age 22.	July 3, 1863.	Resection of one and one-fourth inches of articulating end of humerus, olecranon, head of ulna, and one-fourth inch of radius.
97	*Pupwood, J. H.*, Pt., E, 5th Texas Cav., age 20.	May 25, Jul. 12, '64	Resection of right elbow joint.
98	*Reeves, A.*, ...	———	Secondary resect'n of elbow joint. Died of pyæmia.
99	*Roden, I. B.*, Pt., E, 7th Louisiana, age 35.	May 19, 19, '64.	Excision of olecranon.
100	*Rodgers, J. P.*, Pt., G, 4th Alabama.	July 9, 10, '61.	Resection of joint. Furloughed August 14, 1861.
101	*Rosse, C.*, Pt., Virginia Reserves, age 17.	June 20, 22, '64.	Resection, by Surg. Randolph.
102	*Ruddell, J. R.*, Pt., E, 18th Texas, age 19.	June 22, Jul. 27, '64	Resection of right elbow joint. Furloughed November 24, 1864.
103	*Russell, J. A.*, Pt., H, 57th N. C., age 24.	Dec. 13, 14, '62.	Resection of three inches of ulna of half its thickness.
104	*Saunders, G.*, Lieut., D, 26th Miss., age 22.	June 2, 2, '64.	Resection of elbow joint.
105	*Scott, J. R.*, Pt., C, 6th Louisiana.	June 14, 15, '63.	Resection of condyles of humerus and heads of radius and ulna (Moreau's method).
106	*Shaw, L. W.*, Ensign, 10th S. C., age 23.	July 28, 28, '64.	Left; through curved incision.
107	*Sherdin, H.*, Pt., H, 34th Georgia, age 24.	Aug. 31, 31, '64.	Resection of radius.
108	*Shewmake, V. P.*, ——, age 24.	July 1, 2, '64.	Resection of upper third of ulna; sec. hæmorrhage; amp. arm July 13; gangrene. Died July 20, '64.
109	*Ship, J. C.*, Pt., K, 60th Georgia, age 35.	Sept. 19, 20, '64.	Resection of right elbow joint; erysipelas.
110	*Shultz, J.*, Pt., I, 17th Mississippi.	May 6, 6, '64.	Resection of right elbow joint. Recovered.
111	*Sims, W. H.*, Serg't, F, 6th Florida, age 36.	Sept. 19, Oc. 10, '63.	Resection of elbow joint. Died October 21, 1863, of pyæmia.
112	*Smith, J. W.*, Pt., C, 6th Kentucky.	Jan. 2, 12, '63.	Left; portion of ulna.
113	*Southwell, N. C.*, G, 47th Georgia.	Se. 19, '63, M'y 12, '64	Resection of joint thro' straight incis'n. Died May 21, '64, pyæm.
114	*Stancil, C.*, Serg't, B, 44th N. C., age 22.	Aug. 25, 26, '64.	Resection of olecranon process. Recovered.
115	*Stark, J.*, Pt., E, 46th N. C., age 19.	May 5, 7, '64.	Resection of right elbow joint. Furloughed July 30, 1864.
116	*Strong, E. L.*, Pt., F, 48th Miss., age 21.	May 12, 12, '64.	Resection of inner condyle of humerus. Furloughed July 20, '64.
117	*Sudditt, E. M.*, Pt., H, 6th Arkansas, age 30.	June 21, 21, '64.	Resection of olecranon; also contused wound of abdomen.
118	*Taylor, S. M.*, Pt., I, 2d Louisiana, age 21.	July 2, Aug. 12, 1863.	Left; two and a half inches articulating end of humerus, portion head of radius, remov'g cartilage from articu. surfaces radius and ulna (Moreau's method). Recovered with limited motion in joint.
119	*Taylor, W. A.*, Pt., 1st Arkansas, age 20. See Case 1831, p. 894.	July 20, 1864.	Right; head and one-half inch of shaft of radius; tumefaction; suppuration. Aug. 31, doing well.
120	*Thomas, J. M.*, Pt., L, Cobb's Legion, age 38.	July 12, Au. 9, '63.	Resection head of radius; ball removed. Recovered.
121	*Thompson, A. W.*, Pt., C, 6th Arkansas, age 27.	July 22, 22, '64.	Excision of left elbow joint. Died August 25, 1864.
122	*Tidwell, A. S.*, Serg't, D, 8th Arkansas, age 20.	Sept. 19, Oct. 9, '63.	Resection of elbow joint. Died Oct. 29, 1863, of pneumonia.
123	*Tisdale, B. D.*, Pt., F, 18th Tennessee.	July 29, 29, '64.	Resection head of left radius.
124	*Tolerson, A. J.*, Lieut., C, Holcomb's Legion, age 23.	Nov. 5, 6, '64.	Left; upper extremity of radius and ulna; erysipelas, with sloughing.
125	*Tomlinson, J. H.*, Pt., A, 2d Arkansas, age 30.	Sept. 20, Oc. 23, '63.	Resection of head and three inches of ulna.
126	*Traylor, A. H.*, Pt., D, 5th Texas, age 21.	Sept. 21, 21, '63.	Right; heads of radius and ulna. See Case 1833, p. 895.
127	*Trawick, T. A.*, Pt., B, 6th Alabama, age 20.	Sept. 19, Oct. 15, 1864.	Right; articulating surfaces of radius and ulna, and two and a half inches lower end of humerus.
128	*Treble, J. C.*, Lieut., F, 56th Georgia.	July 22, 22, '64.	Resection of ulna at elbow.
129	*Tull, J.*, Pt., F, 22d Ga., age 37.	June 22, 22, '64.	Resection of left elbow joint.
130	*Vestal, O. D.*, Pt., E, 26th N. C., age 22.	Oct. 14, 1863.	Left; fractured end of upper portion and lower extremity of humerus. Recovered with good use of arm.
131	*Wainstael, V.*, Serg't, I, 15th Louisiana, age 35.	May 15, 31, '64.	Resection of two inches of ulna with olecranon process.
132	*Webster, A. E.*, Pt., B, 28th Georgia, age 22.	Sept. 3, 15, '63.	Resection olecranon in fragments and spiculæ. Furl'd Sept. 20, '63. Wound healed; false luxation.
133	*Whelan, P.*, Pt., C, 18th Mississippi.	July 2, 3, '63.	Resection of two inches of left ulna. Recovered.
134	*Wilburn, W. B.*, Lieut., C, 7th Miss., age 28.	Aug. 1, 19, '64.	Entire resection left elbow joint. Furloughed October 20, 1864.
135	*Williams, W. J.*, Pt., F, 45th N. C., age 26.	June 1, 2, '64.	Right; condyles and olecranon process. Died August 1, from typhoid fever.
136	*Williamson, M. L.*, Pt., B, 7th Georgia Cav.	June 11, 28, '64.	Right; three inches upper end of ulna.
137	*Willis, T.*, Pt., K, 4th Florida, age 19.	Sept. 2, 2, '64.	Resection of right elbow joint; also shell wound of hypogastrium.
138	*Woodward, H.*, Pt., E, 19th S. C., age 19.	Sept. 20, 20, '64.	Resection of elbow joint. Sent to General Hospital Nov. 28, 1864.

Eighty-one of the hundred and thirty-eight patients above enumerated recovered, nineteen died, and thirty-eight are not accounted for.[1] In two cases of recovery, and in one fatal case, recourse was had to ulterior amputation. The fatal terminations are ascribed to pyæmia in six cases; to pneumonia, hectic fever, hæmorrhage, gangrene, typhoid fever, and diarrhœa, each in one case; to the effects of injury, in general terms, or to causes not specified, in seven cases.

Seventy-four of the operations were primary; and forty-five of these, of which the result is known, include seven deaths, or a mortality of 15.5 per cent. The element of

[1] Twenty-three are recorded as "recovered," 28 as "doing well," 28 as "furloughed," 1 as "returned to duty," 1 as "convalescent," 2 as "sent to general hospital," and 36 are not accounted for.

uncertainty introduced by the twenty-nine undetermined cases, detracts from the significance of the results of this series.[1] Thirty-four of these excisions were intermediary, of which thirty with known results include five fatal cases only, a death-rate of 16.6 per cent., a remarkably favorable exhibit for such operations practised during the inflammatory period.[2] The group of eleven secondary operations includes three deaths, giving the exceptionally high mortality ratio for excisions at the elbow at this period of 27.2.[3] Nineteen operations of uncertain date comprise five in which the result is unknown, ten recoveries, and four fatal cases, a percentage of mortality in the determined cases of 28.5.[4] The operation appears to have grown in favor as experience was acquired, three-fifths of the cases bearing the date 1864. Dr. Thomas specifies the limb interested in seventy-four instances; these operations were on the right side in forty, on the left in thirty-four cases.[5]

Surgeons H. McGuire and J. B. Read, P. A. C. S., have published *ex professo* their views on shot wounds of the larger joints. The former refers briefly to excisions at the elbow;[6] the latter is more explicit,[7] and reviews the indications, operative method, after-treatment, and results of resections of this joint, fortifying his positions by citations from Drs. Stromeyer and Macleod.

[1] Of the 38 recoveries after primary excision, 2 were excisions of the three joint ends, 2 of the end of the humerus, 2 of the end of the ulna and radius, 5 of the upper end of the ulna alone, 2 of the head of the radius; in 25 cases the parts excised are not specified. In the 7 fatal primary excisions, it is known that 1 was a humero-cubital excision, 1 a removal of the upper end of the radius and ulna, and 1 of the upper end of the ulna. Of the 29 cases with unknown results, 3 were complete excisions, 3 humero-cubital, 2 of end of humerus, 1 of joint ends of radius and ulna, 3 of ulna, and 2 of radius.

[2] Of the 25 cases of recovery after intermediary excision, 3 were complete excisions, 4 of the humero-cubital articulation, 3 resections of the articular extremity of the humerus, 1 of the ends of the ulna and radius, 8 of the upper end of the ulna alone, and 2 of the head of the radius. The extent of exsection was noted in 2 of the 5 fatal cases, which were resections of the condyle of the humerus. In the 4 cases undetermined as to fatality, the condyles of the humerus were excised in 2, the upper extremity of the ulna in 1, the upper extremity of the radius in 1.

[3] Of the 8 cases of recovery, 4 were complete excisions, 1 humero-radial, 1 of the end of the humerus, 1 of the end of the ulna, and 1 unspecified. The parts removed in the 3 fatal cases are not recorded.

[4] The 10 cases of recovery include 2 total excisions, 2 of the end of the humerus, 3 of the end of the ulna and radius, 1 of the head of the radius, and 1 of the end of the ulna. The end of the humerus was excised in 1 of the 4 fatal cases; in 3 the parts excised are not specified. Of the 5 cases with undetermined result, 1 was total, 1 humero-cubital, 1 of end of humerus, 1 of end of ulna, and 1 of end of radius.

[5] Of the 40 excisions at the right elbow, 4 resulted fatally; of the 34 at the left elbow, 6 were fatal,—the excisions at the left elbow, according to this imperfect return, giving less favorable results than those on the right side.

[6] Dr. H. MCGUIRE, in a *Lecture on Gunshot Wounds of the Joints* (*Richmond Med. Jour.*, 1866, Vol. I, p. 147), after remarking that "gunshot wounds of the larger joints almost invariably demand operative interference," adverts cursorily to shot lesions of the elbow, observing that: "In excision at the elbow, the arm is especially useful when you can save the insertion of the biceps and brachialis muscles."

[7] READ (J. B.) (*Report on Wounds of Large Joints*, in *Southern Med. and Surg. Jour.*, 1866, Vol. XXIII, p. 203) declares that the operation should "always be primary . . . intermediary operations are inadmissible." Complete excision, by the removal of all the articular facets, is enjoined, and the simple straight incision is pronounced the simplest and best method. The limb must be kept flexed at an angle of 130° or 140°, the most favorable position should anchylosis ensue.

EXCISIONS AT THE ELBOW IN OTHER CAMPAIGNS.—It is of interest to compare the results here detailed of this comparatively modern operation, introduced into military surgery only of late years, with the results observed in other campaigns.

TABLE CXXI.

Showing the Results of Cases of Shot Fracture of the Elbow treated by Excision on the Occasions named and from the Authorities quoted.

ACTION, ETC.	TOTAL.	RECOVERY.	DEATHS.	RESULT UNKNOWN.	PERCENTAGE OF FATALITY.

By lumping these figures with those derived from the American war-experience, a large total of excisions at the elbow for shot injury would be obtained,* and one could emulate those statisticians who rejoice in piling up large numerical aggregates, regardless of the varied circumstances under which they were accumulated, and without criticism of their

[1] BAUDENS, *Des plaies d'armes a feu*, 1849, p. 227. In the days in July, 1848, in Paris, BAUDENS successfully excised, at Val de Grace, the condyles of the humerus for shot fracture in the case of Villiard, and performed the same operation in the case of Jacquemin, another garde-mobile, who succumbed from purulent absorption. Professor ESMARCH overlooked these two instances when he asserted (*Über Resectionen*, u. s. w., S. 72) that this operation was not practised in the disorders of 1848–49, in *Paris*, Italy, Baden, and Hungary. [2] ESMARCH (F.) (*Über Resectionen nach Schusswunden*, Kiel, 1851) gives the most complete record, but many of the cases are alluded to in the writings of LANGENBECK and STROMEYER. [3] HUBBENET (C. v.), *Die Sanitätsverhältnisse der Russischen Verwundeten*, 1854–56, Berlin, 1871, p. 182. [4] CHENU (J. C.), *Campagne d'Orient*, Paris, 1865, p. 504. [36] SCHINZINGER (A.), *Das Reserve Lazareth Schwetzingen*, Freiburg, 1873; 3 cases. [37] SCHÜLLER (M.), *Kriegschir. Skizzen*, Hannover, 1871, p. 12; 3 cases (2 fatal). [38] SOCIN (A.), *Kriegschir. Erf.*, 1872, p. 153, 10 cases (3 fatal). [39] STEINBERG, *Die Kriegs Lazarethe und Baracken von Berlin*, 1872, p. 148; 27 cases (7 fatal). [40] STOLL, *Bericht*, u. s. w., in *Deutsche Mil. Zeitschrift*, 1874, B. III, p. 193, 2 cases (1 fatal). [41] CHENU (J. C.), *Aperçu Hist. Stat. et Clin. pendant la guerre de* 1870–71, Paris, 1874, p. 492.

* It would be possible to swell this list by a few isolated excisions at the elbow for shot injury, as, for example, the successful decapitation of the ulna for shot fracture by GOERKE, in 1793; MOREAU'S two complete excisions for caries following shot wounds, in 1794; Dr. H. H. TOLAND'S unsuccessful excision for caries after shot fracture, at San Francisco, in 1856; a humero-ulnar excision by Assistant Surgeon H. A. DUBOIS, U. S. A. (*Circular* 3, S. G. O., 1871, p. 225); and a late successful complete excision by Dr. C. HEETER (LANGENBECK'S *Archiv.*, 1867, B. VIII, S. 101). An omniverous collector might add the four cases in my view apocryphal ascribed by Dr. O. HEYFELDER and others to LARREY and to PERCY.

relative authenticity and value; such are perverters of the legitimate uses of the numerical methods, who purvey for not over-fastidious systematic writers those "largest collections of facts of this nature with which we are acquainted" appended to their descriptions of special injuries,—who, with cool effrontery, profess to decide, from their heterogeneous integrations, within a small decimal whether in any given circumstance amputation, resection, or temporization should be selected. In American civil practice,[1] excision at the elbow has

[1] In the United States, Dr. JOHN C. WARREN is believed to have first practised excision of the elbow, October 16, 1834 (*Records of Mass. Gen. Hosp.*, quoted by R. HODGES, *op. cit.*, p. 46). The result was fatal (VELPEAU, *Nouv. Élém. de Méd. Opérat.*, Paris, 2ème éd., 1839, T. II, p. 699). June 5, 1835, Dr. T. HARRIS, U. S. N., repeated the operation successfully in the case of Mrs. Plunkett, aged 26 years, with caries of the left elbow following a fall (*A Case of Excision of the Elbow Joint*, in *Am. Jour. Med. Sci.*, 1836, Vol. XIX, p. 341). Dr. GORDON BUCK (*New York Jour. of Med. and Surg.*, 1841, Vol. IV, p. 330) successfully excised the right elbow in 1841, for suppurative arthritis, in a seaman, J. Wharton, aged 26 years. He also successfully removed, October 29, 1842, the olecranon, for anchylosis, in the case of J. McCormick, aged 28 years (*Am. Jour. Med. Sci.*, 1843, Vol. V, p. 297); and again excised the elbow successfully, for caries, in the case of B. Foley, aged 25 years (*N. Y. Jour. of Med. and Surg.*, 1846, Vol. VII, p. 58). Dr. JOSEPH PANCOAST, in 1842 (*Med. Examiner*, 1842, Vol. I, p. 609), operated successfully, for caries. An operation by Dr. W. J. WALKER, of Charlestown, is described in Dr. J. B. S. JACKSON'S *Desc. Cat. of the Anatomical Museum of the Boston Soc. for Med. Improvement*, Boston, 1847, p. 41, *Spec.* 181: a very interesting and successful case of removal of two inches of the lower extremity of the right humerus for injury, in the case of a drover, aged 53 years, in August, 1845. Dr. H. J. BIGELOW (*Am. Jour. Med. Sci.*, 1849, Vol. XVII, p. 29) exhibited, August 14, 1848, at a meeting of the Boston Society for Medical Improvement, the bones of an elbow removed for scrofulous caries two days previously. Dr. J. O. STONE (*New York Jour. of Med. and Surg.*, 1851, Vol. VI, p. 300) successfully removed the condyles of the humerus, in the case of Mary Lally, aged 26 years, with a compound fracture, in November, 1850. CAMPBELL (H. F.) (*Surgical Cases*, in *Southern Medical and Surgical Journal*, 1851, N. S., Vol. VII, p. 387) relates a case of compound fracture of the olecranon with luxation of the radius, in a negro of 60, beaten with a cudgel, who recovered with good motion of the joint. Dr. S. SMITH (*A Case of Exsection of the Elbow Joint*, in *American Medical Gazette*, 1855, Vol. VI, p. 338) records a successful excision of the elbow for caries, in the case of M. Mullino, aged 18. Professor H. H. SMITH (*New York Journal of Medicine*, 1855, Vol. XIV, p. 310) successfully excised the elbow for caries in 1854, in the case of a lad of 16. The following surgeons have also practised excisions of the elbow joint: POST (A. C.) (*Caries of Elbow Joint, Exsection*, in *New York Jour. of Med.*, 1856, Vol. I, p. 209) successfully excised the elbow for caries in a lad of 14, and in May, 1866 (*Med. and Surg. Rep.*, 1866, Vol. XIV, p. 411), presented to the New York Academy of Medicine a young lady whose elbow he had successfully excised ten years previously for caries following injury. BELLAMY (C. E.) (*Am. Jour. Med. Sci.*, 1856, Vol. XXXII, p. 375), Cath. S———, aged 28; caries, successful. BLACKMAN (G. C.) (*Western Lancet*, 1856, Vol. XVII, p. 726), Catherine Greary, aged 24; caries, successful. KIMBALL (G.) (*Excision of the Elbow Joint in a case of lacerated Wound of the Articulation*, in *Boston Med. and Surg. Jour.*, 1856, Vol. LIII, p. 513), W. F———, aged 24; successful. HITCHCOCK (A.) (*Excision of Elbow Joint*, in *Boston Med. and Surg. Jour.*, 1857, Vol. LV, p. 12), H. Lawrence, aged 47, railway accident; successful. BIGELOW (H. J.) (*Excision of the Elbow Joint*, in *Boston Med. and Surg. Jour.*, 1857, Vol. LV, p. 122), two cases, males; caries, successes. AYRES (D.), a successful *Case of Excision of the Elbow Joint*, in a child of twenty months, in 1857 (*Am. Med. Gaz.*, 1858, Vol. IX, p. 267). BAUER (L.) reported a case of *Perfect Anchylosis of Elbow Joint, Resection of entire Joint with a view of establishing a movable Articulation; Remarks on the value of that operation* (*Am. Med. Gazette*, 1858, IX, p. 718). BRAINARD (D.) (*Resection of two and a half inches of the lower end of the os humeri, the same extent of the upper end of the radius, and nearly all of the ulna; Recovery with a useful member*, in *Chic. Med. Jour.*, 1858, I. N. S., p. 435). TOLAND (H. H.) relates (*Pacific Med. and Surg. Jour.*, San Francisco, 1858, I, p. 70) the case of P. McMahon, aged 40, who received, June 4, 1854 a shot wound of the right elbow, which resulted in caries, for which excision was performed in 1856. The operation was unsuccessful, and amputation was resorted to November 5, 1856. The patient died of phthisis in November, 1857. This secondary excision at the elbow is apparently the first instance in which the operation was practised for shot injury in this country. FREER (J. W.) (*Resection of the Elbow Joint and Ulna; Recovery with useful member*, in *Chic. Med. Jour.*, 1858, I, N. S., p. 632). Dr. D. H. AGNEW (*Med. and Surg. Rep.*, 1859, Vol. II, p. 18) successfully excised the elbow joint for caries in a colored boy, aged 15. SMITH (S.) (*Exsection of Elbow*, in *New York Jour. of Med.*, 1859, Vol. VIII, p. 258), Catherine Kearns, aged 36; injury by fall, recovery. Also reported in *Am. Med. Times*, 1860, Vol. I, p. 213. WOOD (J. R.) (*Am. Med. Times*, 1860, Vol. I, p. 212) has recorded five cases of excision of the elbow for scrofulous caries: Thompson, age 10, in April, 1852, recovery with motion; Hughes, aged 14, June, 1856, rapid recovery with free motion; Rudd, aged 18, November, 1859, recovery with motion; Curry, aged 23, November, 1859, recovery with fistulæ; Jones, aged 40, in 1859, recovery after amputation. WHALEY (*Exsection of the Elbow Joint*), case of R. Cahl, a lad of 11; caries, success (reported by Dr. G. A. OSTRANDER). HUSTEDT (N. C.) records, in the *Trans. of the Med. Soc. of New York*, 1862, p. 327, the history of a girl of 14, with *Caries of Elbow Joint; Excision, with Recovery of Useful Arm*. BARTON (E.) (*Resection of the Elbow Joint*, in *Boston Med. and Surg. Jour.*, 1863, Vol. LXVII, p. 32), R. French, aged 61, injured by a circular saw; recovery with motion. WARREN (J. MASON) (*Surgical Observations*, etc., 1867, p. 410), removal of external condyle of humerus for compound fracture from a railway accident, in a man of 24 years, November 27, 1864. RANKIN (J. D.) (*Resection of the Elbow Joint*, in *Galveston Med. Jour.*, 1867, Vol. II, p. 874), compound dislocation, in case of W. Payne, a lad of 6; intermediary excision, recovery with motion. HODGES (R. M.) (*Excision of Elbow Joint for Deformity*, in a girl of 14, in *Boston Med. and Surg. Jour.*, 1867–8, Vol. LXXVII, p. 315). ASHHURST (J., jr.) (*Resection of Elbow*, in *Am. Jour. Med. Sci.*, 1868, Vol. LV, p. 42), a man of 58 years; caries, fatal. TODD (S. J.) (*Compound Fracture of Ulna; Resection of Elbow Joint*; case of C. S., a mulatto of 35; wound, primary excision, recovery with motion; *Am. Jour. Med. Sci.*, 1868, Vol. LV, p. 122). DUBOIS (H. A.), successful humero-cubital excision three days after shot injury in a soldier, aged 26, June 7, 1867 (*Circular 3, S. G. O.*, 1871, p. 225). ROPES (F. C.) (*Compound Comminuted Fracture into Elbow, Resection*; Italian barkeeper, aged 34; primary excision, recovery after consecutive amputation; *Boston Med. and Surg. Jour.*, 1869, Vol. II, p. 41). THAXTER (*Excision of Elbow*, reported by G. B. SHATTUCK, in *Boston Med. and Surg. Jour.*, 1869, Vol. II, p. 377), D. D. T———, aged 47, injured by saw; consecutive amputation, recovery. BAUER (L.) (*Total Exsection of Elbow Joint*, in *St. Louis Med. and Surg. Jour.*, 1870, Vol. VII, p. 193), F. H———, a man of 30; caries, successful. ASHHURST (J., jr.) (*Excision of the Elbow*; man of 25; caries, death from meningitis; in *Am. Jour. Med. Sci.*, 1870, Vol. LX, p. 148). HILLER (F.) (*Resection of Elbow Joint*; in case of W. Hunter, aged 24; caries after injury, recovery with motion; in U. S. (Homeopathic) *Med. and Surg. Jour.*, 1870, Vol. V, p. 164). DAWSON (W. W.) (*Excision of the Elbow*, in a negro man with syphilitic disorganization of the joint; recovery with motion; in *The Clinic* (Cincinnati), 1873, Vol. III, p. 283). HOMANS (J.) (*Excision of Elbow*, in a man of 250 pounds, who fell from a roof; death from laceration of the liver and kidney; in *Boston Med. and Surg. Jour.*, 1871, Vol. VII, p. 247). RICHARDSON (*Chic. Med. Times*, 1873, p. 338) relates a successful primary excision of condyles and olecranon in a man of 54, with compound fracture. BIGGAR (H. F.), *Exsection of Elbow*, two cases: Mrs. S., aged 30, caries; J. S., aged 39, caries after dislocation; recoveries with motion; in *Ohio Med. and Surg. Rep.*, 1874, Vol. VIII, p. 94 (reported by Dr. H. C. FROST). BEDDOW (C. K.) (*Resection of Elbow Joint*, in a lad of 10, in the *Medical Record*, 1873, Vol. VIII, p. 319). LOGAN (S.) (*Resection of the Elbow Joint*, W. F., negro laborer of 23; syphilitic caries, excision, recovery with anchylosis; in *New Orleans Med. and Surg. Jour.*, 1875, Vol. III, p. 171). ASHHURST (J., jr.) (*Excision at the Elbow*, in *Proceedings of College of Physicians of Philadelphia*, in *Philadelphia Med. Times*, 1875, Vol. V, p. 539) records eight cases in which he had excised the elbow,—two have been cited above; the third case, of J. K., a girl of 7, with arthritis from injury, recovered with partial anchylosis; the fourth case, J. C., an Englishman of 51, compound dislocation with fracture, death from delirium tremens; the fifth case, arthritis from injury, R. A., a lad of 10, recovery with motion; the sixth case, G. P., a lad of 4, recovery with motion, death a year and a half subsequently from constitutional disease; seventh case, J. S., a lad of 6, syphilitic caries, death from intracranial syphilis; eighth case, C. K., a boy of 6, with anchylosis and arthritis, recovery with motion. The foregoing references include 58 excisions at the elbow with 6 deaths, or 10.3 per cent., but several of the deaths were from causes foreign to the operation.

proved so safe as to almost confirm Syme's famous declaration[1] that "carious joints may be cut into with the same impunity as ordinary abscesses, and cut out with no more danger than what attends amputation, or rather not so much, since the balance of action will be less disturbed, *cæteris paribus*, when the limb is allowed to remain. In military practice, in this country, however, a brilliant success can hardly be claimed for the operation. Although the point is open to argument, I fear that the substitution of this resection for amputation effected no saving of life.[2] The operation would appear to have given more favorable results in the hands of the Confederate surgeons than were observed in the Union armies, judging merely by the reported terminated cases; but the incompleteness of these returns precludes the possibility of any exact estimate of the aggregate results really obtained by the Confederate surgeons. From the best accounts that can be had, it is almost certain that neither in the northern nor southern armies was there achieved any near approximation to the success, either in the proportion of lives or of useful limbs preserved in excisions at the elbow,[3] that rewarded the German surgeons in Schleswig-Holstein in 1848–50. But the excisions in those campaigns marked a new epoch in military conservative surgery. The operations were done, and the after-treatment conducted, either person-

[1] SYME (J.) (*Three Cases in which the Elbow Joint was successfully excised, etc., Edin. Med. and Surg. Jour.*, 1829, Vol. XXXI, p. 261). Other remarks by this eminent teacher are contained in his *Treatise on the Excision of Diseased Joints*, Edinb., 1831, Chapt. V, and in his *Principles of Surgery*, 1842, and *Observations on Clinical Surgery*, 1861, p. 51.

[2] It may be asserted, on the one hand, that the mortality of the aggregate of excisions at the elbow in the Union armies was slightly greater than the mean mortality of all the amputations in the continuity of the upper arm. Secondly, that the mortality of *primary amputations* in the upper and middle thirds of the upper arm for shot injury did not exceed 13.6 per cent. (see TABLE CII, p. 824); whereas the series of either complete or partial primary excisions at the elbow for the same cause was more than 21 per cent. (see TABLE CVI, p. 847). On the other hand, it may be urged that the amputations in the arm for shot injury of *the elbow joint* had a fatality of 24.3 per cent. (see TABLE CV, p. 829), and that the experience of the American War on this question is opposed to the conclusions arrived at by most enlightened and sagacious observers in several European campaigns.

[3] M. DENUCÉ in his article *coude* (in the *Nouveau Dictionnaire de Médecine et de Chirurgie pratique*, Paris, 1869, T. IX, p. 808) ascribes to BOUCHER, of Lisle, the merit of first treating shot comminution of the elbow conservatively by extracting all large splinters. BOUCHER'S interesting cases in the Memoirs of the French Academy of Surgery (1753, T. II, p. 292) are cited in the foot-note to p. 830 *ante*. WACHTER (*Diss. chir. de articulis extirpandis*, Gröningen, 1810, p. 17), and after him O. HEYFELDER, and others ascribe the same practice to J. U. BILGUER, in the Seven Years' War (1756–63). It is true that BILGUER (*Chir. Wahrnehmungen*, Berlin, 1763, SS. 407–483), in three of his fourteen cases of shot injury of the elbow treated conservatively with success (already cited in the foot-note to p. 832 *ante*), mentions an instance, case 4 (p. 407), in which the olecranon was carried away by a cannon ball; case 6 (p. 408), in which "detached fragments were removed from the tissues by the knife;" and case 25 (p. 452), in which 26 necrosed fragments exfoliated; but expressly mentions in regard to case 6, the only one in which there was any operative interference, that "the sharp points were covered with dry dressings, but not removed." GÖRKE, in 1793, excised the head and part of the shaft of the ulna in the case of a soldier wounded in the elbow joint by a cannon ball. The soldier refused to have the arm amputated. The wound healed in five months. The arm was shortened and anchylosed (RUST'S *Theo-prakt. Handbuch der Chir.*, Berlin, 1831, B. V, S. 631). This is the earliest reference I find to this case, which is the first example of a formal excision at the elbow for shot injury, and is cited a year later by JÆGER in his chronological conspectus of resections (Erlangen, 1832), and later by TOROLD (*De Art. Cubiti Resect.*, Berlin, 1855), and others. MOREAU (*père*), in 1794, twice successfully excised the elbow for caries following shot injury. In the first case (Obs. VIII), the joint ends of the three bones were removed; in the second (Obs. IX), the condyles of the humerus and head of the radius were excised (see P. F. MOREAU'S *Essai sur l'emploi de la resection des os*, 1816). Dr. HODGES asserts (*op. cit.*, p. 47) that Baron LARREY urged this excision on his surgeons, a recommendation that cannot be found in the writings of the master, who has little to say of any injuries of the elbow except sabre wounds, and most distinctly advocates amputations at the elbow when the joint is wounded. (His strong language on this point is quoted in the foot-note on p. 828.) The misapprehension is probably due to a passage in PERCY'S article on *Resections* (*Dict. des Sci. Méd.*, 1820, T. XLVII, p. 549), in which he states that it was the old chieftain of military surgery who first suggested to his colleagues to have recourse to resections, and emboldened his co-operators, who still . . . "from timidity, routine, or indifference," often amputated under his very eyes. I think PERCY is here referring to LARREY'S advice regarding shot injuries of the *shoulder*. In his essay of 1803, enlarged in 1815, and translated into English and German, MOREAU states that: "In the armies, resection at the elbow has been practised by Baron PERCY, whose procedures, on account of the variety of shot injuries, must vary according to the loss of substance." VELPEAU and many others have attributed to PERCY one or more excisions at the elbow on the authority of this statement, and Dr. O. HEYFELDER (*Lehrbuch der Resect.*, Wien, 1863, S. 247) goes so far as to particularize three successful excisions for shot injury. His French editor, M. BECKEL, seems to recognize that some authority for this audacious statement is requisite, and cites (*Traité de Resect.*, 1863, p. 190) the article *Resection*, by PERCY and LAURENT, in the forty-seventh volume of the *Dictionnaire des Sciences Médicales*, where it is stated, in commenting on MOREAU'S resections at the elbow, that: "The armies witnessed a multitude of similar or analogous operations, practised with almost constant success on soldiers with the elbow comminuted by large projectiles or disorganized by balls," but not a single concrete case is given; and PERCY would assuredly have adduced an example if he had operated for shot injury, for he soon after relates a case in which he ["l'un de nous"] excised the elbow for a comminuted fracture. The only authentic instances of excision at the elbow for shot injury in the last century were the resection of the upper part of the ulna by GÖRKE, in 1793, and the two excisions for caries following shot injury, by MOREAU, the elder, in 1794. In the present century, although the operation was strongly advocated by GUTHRIE (*Treatise on Gunshot Wounds*, 3d ed., 1827, p. 251), no attempt at excision at the elbow for shot injury appears to have been made until April, 1836, when BAUDENS, in the case of a recruit whose left olecranon was shattered by a ball in an engagement in Algeria, united, by an incision an inch and a half long, the entrance and exit wounds "afin d'en extraire toutes les pièces d'os mobiles et *de resequer* à l'aide de la scie les angles aigus qui couronnaient la tête du cubitus, en sorte que son apophyse disparût en totalité" (*Clin. des Plaies d'Armes à Feu*, 1836, p. 452, Ob. VI). Notwithstanding the success with which excision at the elbow for disease had been practised by SYME, it was not until 1848 that the operation was fairly introduced in military surgery. Professor ESMARCH'S memorable tabular statement (*Ueber Resectionen nach Schusswunden*, 1851, p. 137) shows that the operation was done twice in that year by Professor B. v. LANGENBECK; in 1849, by Dr. STROMEYER on seven occasions, on four occasions by Dr. ESMARCH, on four by Dr. SCHWARTZ, twice by Dr. GÖZE, and once by Drs. B. v. LANGENBECK, NIESE, HANSON, MARCUS, and DOHRN. In 1850, the operation was repeated twice by Dr. STROMEYER, twice by Dr. SCHWARTZ, four times by Dr. DOHRN, twice by Dr. BARTELS, twice by Dr. HERRICH, and by Drs. NIESE, GÖZE, and KUNCKEL, each in one case.

ally or under the immediate direction of masters of the art, upon patients who were not exposed to the perils of transportation. In the Crimean War the excisions at the elbow practised by the British surgeons had equally gratifying results; but the Russians had little success with the operation, and the French, none. In the Danish War, of 1864, the German surgeons were much less successful in their resections of this joint. In the late Franco-German war, the average results obtained by the German surgeons are not discouraging, when the circumstances of the campaigns are considered. But the results which M. Chenu reports from the French armies are simply appalling, and, if taken alone, would fully justify Professor Sédillot's recent declaration, that resections at the elbow should be altogether rejected in the present state of war surgery.[1] It is impossible to call in question the accuracy of the returns of M. Chenu, the eminent surgical historiographer and statistician of the last three great wars in which France has engaged. The terrible fatality his last volumes present, is everywhere corroborated by the fragmentary reports that have been published.[2] There is no other explanation to be given of such deplorable and inexcusable loss of life than that offered by Professor Sédillot, which is quoted in the foot-note. The organization of the French medical staff in the late war was such that the surgeons were powerless to give directions in their own department, or to secure the comforts essential for the welfare of their wounded, since they were subordinated to a stolid body of line officers ignorant of their necessities. This miserable system, which it is sought to enforce in our own Navy, and which not a few would like to introduce into our Army, brought about results so obviously disgraceful and horrible,[3] that it has been radically reformed by the French republican government.

CONCLUDING OBSERVATIONS ON EXCISIONS AT THE ELBOW.—The period of election

[1] SÉDILLOT (*Du traitement des fractures des membres par armes de guerre*, in *Gaz. méd. de Strasbourg*, 1870, and *Arch. gén. de méd.*, 1871, VI^e série, T. XVII. p. 98 et p. 411): "Nous avons exposé les motifs qui nous avaient fait rejeter cette opération dans les conditions actuelles de la chirurgie de guerre, et nous ne les rapellerons pas." The "motifs" elsewhere explained are: "Triste à avouer? Les chirurgiens n'ont pu encore, *malgré toutes leur réclamations et l'évidence des désastres auxquels on les condamne, placer leur blessés dans des conditions salubres, et l'encombrement et les endémies infectieuses paralysent leurs efforts et les privent d'une des plus belles ressources de leur art.*"

[2] PONCET (F.) (*Contrib. à la Relat. Méd. de la Guerre*, de 1870–71, in *Montpellier Médicale*, Mars, 1872) records 3 cases of excision at the elbow for shot injury of which 2 were fatal. TACHARD (E.) (*Reflexion pour servir à l'Hist. de la Chir. en Campagne*, in *Gaz. des Hôp.*, 1871, p. 231) tabulates 5 resections at the elbow, 3 fatal. MACCORMAC (W.) (*Notes, etc., op. cit.*, 1871, p. 39) tabulates 11 excisions at the elbow, 4 primary with 1 death, 7 secondary with 5 deaths. DESPRÈS (A.) (*Rapport de la Septième Ambulance*, 1871, p. 58) records 4 resections at the elbow with 2 deaths. ARNAUD (in GRELLOIS. *Blocus du Metz*, 1872. p. 353) gives a fatal excision of the elbow. COUSIN (*Ambul. de la Presse Française, Service de* M. DEMARQUAY, *l'Union Méd.*, 1872, p. 126) relates a fatal case of complete excision. FELTZ and GROLLEMUND (*Rel. Clin. sur les Ambul. Haguenau*, in *Gaz. Méd. de Strasbourg*, 1872, p. 224) and M. SÉDILLOT (*Arch. Gén. de Méd.*, 1871, T. XVII. p. 411) relate single fatal instances. BRIGHAM (C. P.) (*Quelques Obs. Chir.*, Paris, 1872, p. 40) also gives an unsuccessful complete excision. M. A. CHIPAULT (*Fractures par Armes à feu*, 1872, pp. 128, 138) narrates, at length, 2 successful complete excisions at the elbow joint.

[3] These expressions are not exaggerated. In the unimpeachable testimony of Professor SÉDILLOT, even stronger language is employed. In accounting for the frightful mortality of the wounded at Haguenau, he says: "Supposez, comme ne l'ont que trop prouvé les lamentables statistiques du Dr. Chenu, dont les travaux ont été couronnés par l'Académie des sciences, que les blessés soient laissés sans eau potable, sans aliments convenablement choisis et préparés, sans médicaments, sans moyens de pansements, au milieu d'une telle puanteur qu'on était obligé, pour *la masquer*, de brûler du bois vert dans les salles,—et vous comprendrez les effroyables mortalités qui ont eu lieu."

[4] HODGEN (J. T.), *St. Louis Med. and Surg. Jour.*, 1867, Vol. IV. p. 500. *An Apparatus for Suspending the Superior Extremities in case of Extensive Injuries about the Wrist, Forearm, and Elbow.* 1 1, movable hooks on the wire frame 2 2, to which cords, A A, passing through pulleys, 3 3, are attached; 4, pulley for cord B; 5 and 6, pulleys for cord C; 7, sand-bag.

[5] The cut is copied from SOCIN (*Kriegschir. Erf.*, 1872, S. 120), who calls this the "American splint." *a*, iron wire frame; *b*, webbing strips; *c*, drainage tube. Dr. LOSSEN (*Deutsche Zeitschrift für Chir.*, 1873, B. II, S. 57) declares that SOCIN erroneously terms this splint "American," since it was devised by Professor VOLKMANN. It is obviously derived from Professor N. R. SMITH'S wire splint for the lower extremity.

for excisions at the elbow for shot injuries has been hitherto regarded as an unsettled question.[1] I believe that the evidence, when fully analyzed, will demonstrate that this resection conforms to the general rule in shot fractures of the limbs, that primary operations are preferable whenever it is certain that recourse must eventually be had to operative interference.[2] We have seen[3] that Medical Director Tripler regarded this as the best rule. It is to be regretted that a committee of surgeons of high standing, but without much experience in this particular branch of surgery, distributed through the armies a document recommending an opposite line of conduct, and essayed to strengthen their position by what we cannot but regard as an undoubtedly unintentional misinterpretation of the experience of the Schleswig-Holstein surgeons.[4] A great cause of misapprehension on the subject is the confounding of the intermediary and secondary operations. It is undoubted that of those patients who have sufficient power of vital resistance to pass through the stage of inflammation and suppuration a larger proportion will survive severe surgical operations than would recover

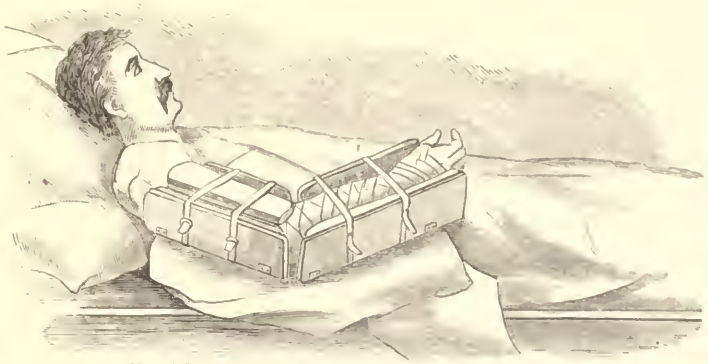

FIG. 653.—BUTCHER'S dressing for excision at the elbow.[5]

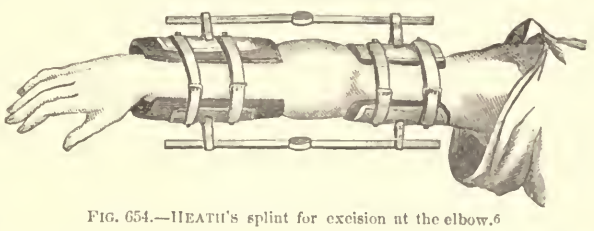

FIG. 654.—HEATH'S splint for excision at the elbow.[6]

[1] BILLROTH (TH.) (*Chir. Briefe aus den Kriegs-Lazarethen*, u. s. w., Berlin, 1872, S. 224): "According to present experience regarding the end-results after elbow resection, we cannot implicitly endorse the primary resection. The statistics accessible at present, it is true, are *quoad vitam* in favor of primary resection as compared with secondary; but the numbers appear to me too small to arrive at a definite conclusion; and would we place any great value on such limited statistics, we would be compelled, from the facts known to us at present, to pronounce in favor of non-operative treatment."

[2] Facts rather than authorities are of weight in determining this question; but it is of interest to observe that the majority of surgeons of much experience with this operation are in favor of early interference, and insist that if excision is not practised immediately it shall be delayed until after the inflammatory phenomena have entirely disappeared. J. F. HEYFELDER, for instance (*Über Resectionen und Amputationen*, Breslau and Bonn, 1854, S. 150), treating of excision at the elbow, remarks: "Regarding the time for the performance of this resection, it will be seen that, as in amputations after shot wounds, a favorable result of the operation is so much more to be expected the earlier the resection is performed, whereas, when inflammation has already appeared, it is preferable to delay the operation until the inflammation has been subdued, which may be accomplished by the application of ice."

[3] APPENDIX to PART I, *Med. and Surg. Hist. of the Rebellion*, p. 60. In a note to General Orders No. 30, of October 3, 1861, promulgated from General MCCLELLAN'S headquarters, it is stated that: "The Medical Director desires that exsection of the shoulder and elbow joints shall be resorted to, in preference to amputation, in all cases offering a reasonable hope of success."

[4] *Report of a Committee of the Associate Members of the Sanitary Commission on the Subject of Excision of Joints for Traumatic Cause*, Cambridge, 1862, signed by Drs. HOWARD, TOWNSEND, WARE, J. MASON WARREN, CABOT, DALE, and HODGES. The general statements are made that: "The fact cannot be concealed that excisions, hardly excepting even those of the humerus and of the elbow, are operations not likely to succeed in the hospitals of an army under any circumstances," and that "exeisions of large joints are never to be practised on the battle-field." The committee then lays down rules for the excisions of the several joints, uniformly advocating delayed operations, a precept already advocated by the reporter, Dr. HODGES (in his well-known Boylston prize essay *On the Excision of Joints*, Boston, 1861), whose conviction in favor of secondary excisions had been established, he says, before he "learned that the experience of the Schleswig-Holstein surgeons had led them to a similar conclusion." Now nothing can be clearer than that the experience of the Schleswig-Holstein surgeons led to a directly opposite conclusion. Dr. ESMARCH says of excisions at the elbow (*Über Resectionen*, 1851, S. 89): "As regards the space of time between the reception of the injury and the operation, a similar relation exists as in resection of the shoulder joint, and indeed as in amputation of the larger limbs," previously stated, S. 49, thus: "It is advisable to resect early, if possible directly after the reception of the injury, or within the first twenty-four hours." Professor ESMARCH is avowedly expressing not only his own opinions, but those of the Prussian chief-surgeon B. von LANGENBECK, and the Hannoverian chief surgeon LOUIS STROMEYER. In the passage quoted from STROMEYER'S work (*Ueber die bei Schusswunden vorkommenden Knochenverletzungen*, Freiburg, 1850, S. 39) that, "as regards the result, it is of no consequence whether the resection has been performed in the first forty-eight hours or after the full development of suppuration," the professor is undoubtedly speaking as to the result in relation to the mobility and usefulness of the limb, for the whole tenor of the context is in advocacy of early interference and in opposition to expectant measures. That such was Dr. STROMEYER'S later conviction is well known, for in speaking of the less favorable results of the elbow excisions at Langensalza (*Erfahr. über Schusswunden*, in Jahre, 1866, S. 48), he ascribes as the cause the larger proportion of delayed operations. Professor LANGENBECK did not publish directly his opinion on this point; but it was well known through his disciples. Dr. HARALD SCHWARTZ says (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, S. 219): "Regarding the time of operations, primary operations, within the first twenty-four hours, are decidedly preferable;" and MAAS (*Kriegschir. Erf.*, Breslau, 1870, S. 82) says: "The operation is always to be practised as early as possible."

[5] BUTCHER (R. G.), *Essays and Reports on Operative and Conservative Surgery*, 1865, Pl. XV, and page 197.

[6] HEATH (C.) (*The Lancet*, 1857, Vol. II, p. 546, and *Manual of Minor Surgery*, 4th ed., 1870, p. 227). Four padded iron plates are connected by hinged steel rods.

from the same operations practised when they were in robust health; but it is known that a large number perish before inflammation abates; and the real question is, whether life is exposed to greater jeopardy by immediate interference or by delay.

The extent to which the bones should be removed in attempts to save the limb by resection is another grave question, on which it may be hoped the observations here accumulated may throw some light. The doctrine that complete resections give more favorable results both in preserving life and utility of limb is generally conceded, and is confirmed by the experience here recorded. The view of Baudens, that excision should only be practised when one of the joint ends is injured, is entirely abandoned. There can be little doubt that removal of the head of the radius, for example, or of one of the condyles, or the upper extremity of the ulna, is much more liable to be followed by anchylosis or by destructive inflammation than the excision of the entire joint. But it is not a settled question whether, when the joint is exposed, and the ligamentous attachments have been freely divided, and the injury is found confined to the lower end of the humerus, it is safer to saw off the uninjured extremities of the radius and ulna, or whether, if the joint ends of the bones of the forearm alone are comminuted, it may be necessary to remove the condyles of the humerus. In excision for white swelling, Syme has shown that it is wisest to remove all the articular extremities, for the cartilages and subjacent porous bone are already diseased. But in operations for injury, it would seem *a priori* that there was not the same object in inflicting additional injury by a section of healthy bone, and the deduction seems to be sustained by facts, excellent results having been obtained when the joint ends of either the upper or forearm have been removed after complete exposure of the joint, and the uninjured portions of the articulation have been unmolested. The method of operating most frequently

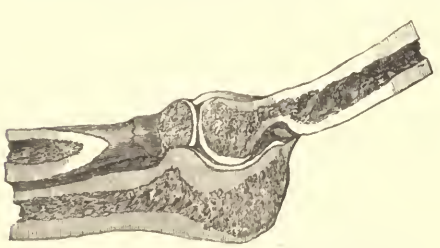

FIG. 657.—Section showing the relations of the bones of the elbow in the median line. [After ANGER.][1]

[1] The section gives an excellent idea of the relations of the elbow joint. It is a reduction from a drawing by M. BICE for Dr. B. ANGER'S admirable *Traite iconographique des maladies chirurgicales*, p. 148, FIG. 35. It was obtained, Dr. ANGER informs us, from a preparation injected with hyposulphite of soda, and then mummified; it represents the bones only of the elbow joint, divided antero-posteriorly and vertically, nearly in the median line.

adopted by both Confederate and Union surgeons appears to have been by a single longitudinal incision parallel with the radial border of the ulnar nerve, extending a convenient distance above and below the olecranon, as originally proposed by Park, and commended by Langenbeck, Gross, and Ashhurst.[1] Not a few, however, preferred the methods of Moreau or Liston, or crucial or lunated incisions. The ⊣-shaped incision of Liston undoubtedly affords an easy mode of exposing the joint, and nothing can be more lucid and satisfactory than Dr. Esmarch's description of the operation by this method,[2] which he and Dr. Stromeyer prefer; but I can bear the same testimony as Dr. Lücke, who declared, after observing a large number of elbow joint resections, that he had seen none in which the parts could not be readily removed through a single straight incision. The immediate after-dressing was regarded as of not less essential importance than the later after-treatment. Various ingenious appliances for suspending or supporting the limb in a favorable position, and affording at the same time facilities for dressing, devised by Drs. Hodgen, Bauer, Bond, Ahl, and others, have been figured on preceding pages. Perhaps nothing so perfectly meets the indication as the Stromeyer-Esmarch bracketed splint, shown on page 888. When a loose dangling limb results, some support is required by an artificial apparatus. That of Dr. E. D. Hudson, figured in PLATE LIV in connection with the portrait of the patient for whom it was devised, and of another who used it with advantage to assist his "dangle-joint,"[6] is similar in principle, and perhaps less complicated and cumbrous than those employed by the European surgeons, and figured by Lœffler (FIG. 658), by Dr. von Langenbeck, and by Dr. Socin (FIG. 659). The advantages derived from such apparatus are but limited.

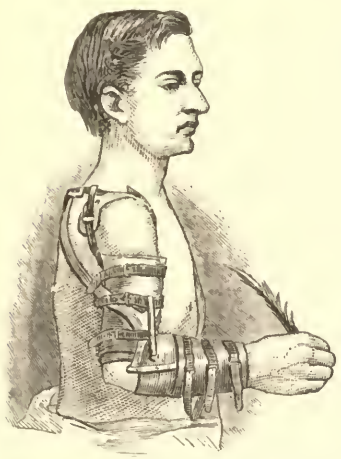

FIG. 658.—Apparatus commended by B. v. LANGENBECK.[3]

[6] LÖFFLER (F.) (*General Bericht über den Gesundheitsdienst im Feldzuge gegen Dänemark*, 1864, Berlin, 1867, S. 269) remarks: "Therefore it will be seen that of 28 recoveries after resection of the elbow joint in the campaign of 1864, 20, or 71 per cent., resulted in dangle-joints. Dangle-joints without supporting apparatus are of little use, even if the hand and fingers are capable of voluntary motion. The supporting apparatus, at least as now constructed, does not, as a rule, materially increase the usefulness of the limb, and frequently it cannot be worn at all, as it should be worn to be useful. . . . Nevertheless the possessor of a dangle-arm rejoices that he has not lost the member by amputation, and has so much the more reason for it, as the artificial substitute for losses on the upper extremity serve as little more than ornamental appendages. But the surgeon, to-day, must consider the question from another point. He must compare the recoveries with anchylosis and recoveries with a loose dangling limb." Further on (*op. cit.*, p. 272) he observes; "There is not a single case of complete anchylosis after resection of this joint in the campaign of 1864,—a happy exhibit if it were not overshadowed by 71 per cent. of cases of dangle-joint (although no one operated or aimed to operate otherwise than subperiosteally). It is true, we find now

There was a numerical predominance of injuries and operations on the left side,[1] slight, but too decided to be likely to be counterbalanced by any determination of the few cases in which the side interested was unspecified. The excisions at the left elbow had less favorable results in the proportion of 4 per cent.

I regret that the information collected respecting the end-results of the cases of elbow excisions is often so vague, and even contradictory, as not to be susceptible of expression in a condensed shape, and also that there is not space to record all the definite facts that have been obtained. In a considerable number of cases, however, the condition of the pensioners many years subsequent to operation has been recorded, and sometimes illustrated by copies of photographs. I hope to revert to this subject, and to submit ample details in the *Third Surgical Volume*. PLATE XLV, opposite, illustrates the later history of two deferred excisions,[2] resulting in loose flail-like joints, which were to some extent benefited by Dr. Hudson's apparatus.

In the course of this Section, many of the more important writings on the subject have been referred to. Some of the special monographs are enumerated below.[3]

---

and then, among the cases of recovery, thickening of the sawn ends, even osteophytic after-formations of normal protuberances; but nowhere is a prolongation of the sawn end by new bone-formation in the axis demonstrated, while cases of shortening by necrosis of the ends of the bones are not wanting."

[1] The series of 623 excisions at the elbow comprises 470 recoveries,—229 operations practised on the right, and 228 on the left elbow; not specified, 13; and 146 fatal operations,—60 on the right, and 75 on the left, with 11 unspecified cases; also 10 excisions with unknown results,—5 on the right, 3 on the left side, and 2 unspecified. It will be observed that of 600 cases in which the side involved was known, 294 were excisions at the right, and 306 at the left elbow; of 289 of the former with known results, 60 or 20.7 per cent. were fatal; of 303 excisions at the left elbow with known results, 75 or 24.7 per cent. were fatal. Compare Note 5 on page 900.

[2] The left-hand standing figure in PLATE LIV represents the appearances of the limb in the case of Private J. F. Hertzog, 47th Pennsylvania (CASE 53, of TABLE CX, p. 876), from a photograph taken three years after a complete intermediary excision at the right elbow for shot comminution, by R. B. BONTECOU, U. S. V, and contributed to the Museum by Dr. E. D. HUDSON. Dr. HUDSON has given a full account of the case, with wood-cut illustrations, in his pamphlet *Save the Arm*, New York, 1864, p. 6. It was an example of "dangle-joint," he says, for which he originated his first apparatus for excision at the elbow. With the aid of this appliance (which is figured in the plate) the pensioner could flex and extend the forearm, holding a ten-pound dumb-bell. The functions of the hand were good when the pensioner was paid in 1874, twelve years after the operation. The second, or sitting figure, is from a photograph of Private Martin V. B. Keller, 1st Pennsylvania Reserves (CASE No. 16, TABLE CXII, p. 889), taken three years after a complete secondary excision of the elbow joint for caries following shot perforation, by Dr. JOHN H. PACKARD. This was another example of "dangle-joint," in which the apparatus supplied by Dr. E. D. HUDSON, who contributed the photograph, proved of some service. Dr. PACKARD received, in 1870, letters from this pensioner, who, in June, 1875, was in good health.

[3] Besides the general treatises on excision or resection of joints, of which many have been cited, the student can refer to the following special papers on elbow joint resection: THORE (A. M.) (*De la résection du coude, et d'un nouveau procédé pour la pratiquer*, Thèse. Paris, 1843) collects 82 cases of excision of the elbow: 14 for injury—12 recoveries and 2 doubtful; 68 for disease—48 recoveries and 20 fatal; and adds 3 cases operated on by himself, of which 1 proved fatal. PLATE LIV.— RESULTS OF RESECTIONS AT THE ELBOW FOR SHOT INJURY

Fig 1. Case of Private J F Hertzog
(See page 876)

Fig 2 Case of M V B Keller
(See page 889

AMPUTATIONS AT THE ELBOW JOINT.—Forty examples of this operation are found on the returns, and the results were very satisfactory, since the ratio of mortality was far less than in amputations in the continuity of the upper arm.[1] Of thirty-nine determined cases, but three, or 7.6 per cent., terminated fatally, although five patients recovered only after submitting to re-amputation—three in the continuity of the upper arm, two by disarticulation at the shoulder.

Amputation at the elbow was first practised in this country July 4, 1821, by a military surgeon,—Surgeon James Mann, U.S.A.,—the operation being the fourth of the kind recorded in surgical annals.[2]

As indicated in TABLE CV, amputation at the elbow has been seldom practised for shot injuries directly interesting the joint; but more commonly for grave mutilations of the forearm, in which the only alternatives were disarticulation or amputation in the upper arm. In six only, of the forty cases, were the bones of the elbow fractured.

There are two accidents of war in which this operation[3] is often especially indicated, viz.: when a portion of the forearm is carried away by a large projectile, or when the forearm of an artilleryman is pulpified by the premature explosion of his gun while he is ramming the cartridge. In these cases, even if the limb is dismembered a little above the wrist, there are often such deep-seated lacerations that it is desirable to get above the tendinous and muscular insertions in removing the limb. Twelve of the forty disarticulations of this series were necessitated by one or the other of these forms of injury.

---

[1] At the date of publication of Circular No. 6, S. G. O., 1865, but *nineteen* amputations at the elbow had been found on the returns. These presented a gratifying uniformity of success (Circ. 6, p. 46). Twenty-one other authentic examples of the operation were subsequently reported, besides cases described as "amputations at the elbow," that proved, on investigation, to have been in reality amputations in the continuity, in the lower third of the humerus.

[2] Probably few readers of this work will fail to recall the terms in which Professor GROSS (*A System of Surgery*, 5th ed., 1872, Vol. II, p. 1110) adverts to this operation, expressing surprise that until recently it was performed so seldom, in view of "what an admirable stump it leaves, what little risk it involves, and how promptly the parts usually heal."

[3] The bibliography of this operation has been studied in an inaugural dissertation by ERNST F. L. THOMAS, of Gotha, (*Ueber die Exarticulation des Vorderarmes*, Würzburg, 1861), and in an extended monograph by Professor C. W. F. UHDE, of Brunswick (*Die Abnahme des Vorderarms in dem Gelenke* Braunschweig, 1865). The first recorded amputation at the elbow was by AMBROISE PARÉ, in 1536 (it is recorded in the Paris edition of 1575, in Chapter XXX of the *Livre des Contusions*, p. 413; *Histoire memorable d'une mortification advenue à un soldat, auquel le bras fut coupé à la jointure du coude;* in GUILLEMEAU'S edition of 1582, at Chap. XXV, p. 379; in the Latin Frankfort edition of 1594, at Chapter XXV, p. 373; in UFFENBACH'S *Thesaurus*, of 1610, Lib. XI, Cap. XXV, p. 279; in JOHNSON'S English translation of 1634, Lib. XII, Chap. XXV, p. 463; in the Lyon edition of 1652, at Chap. XXXVII, p. 309; in MALGAIGNE'S edition of 1840, in the XXVIII Chapter of the tenth book, T. II, p. 233), in a case of a soldier at Turin, whose left forearm became gangrenous after a lacerated wound by harquebuse ball. PARÉ recalls the precept of HIPPOCRATES, in the fourth section of his book Περι αρθρων (*Œuvres d'Hippocrate*, éd LITTRÉ, T. IV, p. 285), in favor of amputations at the joints in gangrene, and describes the rapid recovery of the patient, despite an intercurrent attack of tetanic spasms. MATTHIAS GOTTFRIED PURRMANN (*Funffzig sonder-und wunderbahre Schuss-Wunden-Curen*, Franckfurt und Leipzig, 1721, S. 3, and *Chirurgia Curiosa*, Frankf. und Leipzig, 1699, p. 651,—the allusion omitted in COWPER'S English translation of PURRMANN. London, 1706, p. 211) relates, with disapprobation, an unsuccessful amputation at the left elbow joint, performed in 1671, by CHRISTIAN RAMPHTUN, surgeon of the Götz regiment of foot, in the case of a musketeer, Christian Andersohn, wounded at Castle Türkshausen, by a falconet-shot. Great inflammation ensued, and cramps and convulsions on the third, and death on the fifth day. Although in his *Essai sur les Amputations dans les Articles* (*Mém de l'Acad. de Chir.*, 1774, T. V, p. 747), which still remains the basis of all modern dissertations on the subject, BRASDOR had described and commended exarticulations at the elbow, the operation remained in desuetude for nearly a century and a half, when it was revived, in 1819, by CAJETAN TEXTOR (*Der Neue Chiron*, Sulzbach, 1823, B. I, S. 126; see also, for a description of the mode of operation, SCOUTETTEN'S oval method being commended, TEXTOR'S *Grundzüge der Chirurg. Operationen*, Th. I, S. 420), in the case of a laceration, from blasting, of the left forearm of H. Keller, aged 41 years, who made a good recovery. In 1822, Dr. JAMES MANN (the distinguished author of *Medical Sketches of the Campaigns of* 1812–'14, Dedham, 1816) printed, in the seventh volume of the *Medical Repository*, a paper entitled *Observations on Amputations at the Joints*, which appears to have attracted less attention than it merited in this country, although it has been much cited by European surgeons. It is an excellent argument in favor of amputations in the contiguity, showing a great familiarity with the literature of the subject, and embracing an account of a successful primary amputation at the elbow, in the case of an artillery soldier at Fort Independence, whose right forearm was carried away July 4, 1821, by the premature discharge of a cannon. Ignorant of MANN'S important paper (since he was "not aware that the operation had been attempted at the elbow joint since it was performed by AMBROSE PERÉ"), Dr. J. KEARNEY RODGERS (*New York Med. and Phys. Jour.*, 1828, Vol. VII, p. 85) reports a successful amputation at the right elbow joint by antero-posterior flaps, in the case of a negro of 35 years, with a laceration of the forearm from the discharge of a musket at near range. Although Baron D. J. LARREY at first disapproved of amputations at the elbow, observing (*Mém. de Chir. Mil.*): "Nous ne parlerons de l'extirpation de l'avant-bras à son articulation avec le bras, parce qu'elle ne peut être utile au sujet qui serait dans le cas de la subir et qu'elle serait rarement suivi de succès" yet he subsequently (*Clin. Chir.*, 1836, T. V, p. 202) cited the recovery of Sergeant-major Labuerrasse, whose right forearm was torn off at the elbow, in 1793, by a cannon ball, remarking, "ce succès prouve que l'on peut, dans quelques cas, pratiquer l'amputation du membre thoracique dans l'articulation huméro-cubitale." DUPUYTREN (*Leçons orales de clin. chir.*, 2ème ed., 1839, T. II, p. 343) warmly advocated amputations at the elbow, and the editors of SABATIER-DUPUYTREN (*De la Méd. Op.*, 1832, T. IV, p. 653), MM. SANSON and BEGIN, speak as if the master frequently practised the operation ("Sept ou huit fois avec succès"), although none of the individual cases are recorded. DUPUYTREN proposed a well-known anterior flap operation and the division of the olecranon by the saw, in place of BRASDOR'S more complex procedure. LISTON also (*Practical Surgery*, 3d ed., 1840, p. 366) declared that the operation might be performed with advantage, and that he had done it "more than once on the living body, and should be disposed to repeat it in favorable cases." V. WALTHER, according to ZANDERS (*Die Ablösung der Glieder in den Gelenken*, Düsseldorf, 1831), and JAEGER (*Hand-*

Primary Disarticulations.—Twenty-eight of the forty disarticulations at the elbow were primary—operations with but one fatal result,—in a patient who submitted to a simultaneous amputation of the left leg. Sixteen of the primary disarticulations were at the right, and twelve, including the fatal case, at the left elbow.

CASE 1836.—Priyate C. McDavitt, Co. K, 19th Massachusetts, aged 23 years, was wounded at Fredericksburg, December 13, 1862. Assistant Surgeon V. R. Stone, of the regiment, recorded: "Gunshot fracture of arm; amputated. Transferred to General Hospital." Surgeon H. Bryant, U. S. V., recorded the man's admission to Lincoln Hospital, Washington, December 23d, with "amputation in consequence of compound comminuted fracture of both bones of right forearm by minié ball, and slight flesh wound of left leg." The patient was subsequently transferred to Lovell Hospital, Portsmouth Grove, whence he was discharged May 28, 1863, and pensioned. Examiner B. T. Shaw, of Boston, June 4, 1863, certified: "Was wounded by a ball which caused a compound comminuted fracture of his right forearm, which required amputation at the elbow joint. He was also wounded by a minié ball in the calf of the left leg at the same time, badly injuring the muscles and tendons, so that he is lame." In March, 1864, the pensioner was furnished with an artificial limb by M. Lincoln, of Boston, who described the amputation as having been performed by the "circular method (though very uncertain)." Dr. B. B. Breed, of Lynn, Mass., late surgeon U. S. V., in answer to a request of the Surgeon General, U. S. A., communicated, July 19, 1863: "I have examined the case of C. McDavitt, late private, Co. K, 19th Massachusetts. McDavitt is a man of good intelligence, and after his discharge from the 19th received a commission in the 4th Massachusetts Heavy Artillery. His arm was amputated for gunshot fracture of the forearm at the elbow joint. The arm is very thin, and bears marks of numerous cicatrices where collections of pus have been opened. The skin is drawn rather tightly over the condyles, and is thin and tender. He thinks the stump would have been much sounder if the amputation had been performed two inches higher. His principal objection to the operation is, however, that in fitting an artificial limb the maker was obliged to make the joint two inches below the extremity of the stump, thus making an awkward and useless limb. He has only worn it for a few days, and states that it is as 'good as so much cord-wood, and no better.' It proved a great encumbrance, and not of the slightest benefit. The operation was performed by Surgeon N. Hayward, 20th Massachusetts," etc. In a communication dated July 21, 1863, the pensioner stated that "his arm was amputated on the day following the injury," and that "the stump healed up about four months after his discharge from service, and had given no trouble since." The pensioner was paid September 4, 1875.

---

wörterbuch der gesammten Chirurgie, Leipzig, 1836, B. I, S. 363–368), and LANGSTAFFE, according to UHDE (*l. c.*, S. 64), practised this operation for disease. BAUDENS (*Clinique des plaies d'armes à feu*, 1836, p. 579) insisted on the utility or the operation in military surgery, and reported a successful case, L——, 15th Carbineers, together with some instructive criticisms on the methods of operating. Baron PIROGOFF advocated the operation (*Zeitschrift für die gesammten Medicine von* OPPENHEIM, Hamburg, 1842, S. 567, and *Rapport mé l. d'un Voyage au Caucase*. St. Petersburg, 1849, pp. 175–182), and reported three cases, with one death. In the revolution in Paris, in 1848, MALGAIGNE especially, and JOBERT, defended this amputation, and each of them practised it in two instances of shot wounds (MALGAIGNE, *Gaz. Méd.*, 1848, Nos. 32–35, and *Méd. Op.*, 7ème ed., 1861, p. 311; JOBERT, *Gaz. Méd.*, 1848, No. 37). BAUDENS also (*Plaies d'armes à feu, Discussion a l'Academie de Méd.*, 1849, p. 222) reports a fatal disarticulation at the elbow, of June 23, 1848, the case being complicated by a penetrating shot wound of the chest, for which reason, doubtless, it has been rejected by Dr. UHDE. Dr. STEINER, a Baden regimental surgeon, in 1849 (B. BECK, *Die Schusswunden im Kriege* 1848–49, Heidelberg, p. 328), Dr. H. SCHWARTZ (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, S. 222) in 1849, and M. E. SOULÉ (*Gaz. des Hôp.*, 1851, p. 114) in 1850, each successfully disarticulated at the elbow in cases of shot injury; and Dr. PFRENGER, of Coburg (UHDE, *l. c.*, p. 6), had a successful case in 1855. This brings us to the extraordinary series of exarticulations at the elbow ascribed to M. SALLERON during six months' service in the Crimean War. Professor UHDE (*l. c.*, S. 64) and M. LEGOUEST (*Chir. d'Armée*, 1863, p. 723) state that M. SALLERON had twenty-six disarticulations at the elbow with five deaths. In M. SALLERON'S own report (*Des Amp. Prim. et des Amp. Consec.*, dans *Recueil de Mém. de Méd. de Chir. et de Phar. Mil.*, 1858, T. XXI, p. 283, et T. XXII, p. 240), however, only twenty cases are tabulated—three primary and sixteen consecutive amputations for shot injury, with three deaths among the deferred operations, and, in addition, one fatal case of amputation at the elbow for compound fracture. M. SALLERON does not claim to have practised all of these operations in person; but describes them as treated at Dolma-Bagtché Hospital, at Constantinople. It is known that M. LEGOUEST (*Chir. d'Armée*, 1863, p. 724, et 2ème éd., 1872, p. 557, and letter of M. LEGOUEST, Nov. 8, 1863, in UHDE, *l. c.*, p. 61) had one successful disarticulation at the elbow for shot injury, that M. MAUPIN (*Souvenir d'Orient, Amp. prim. et consér. faites en Orient*, 1857, p. 17, et *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, 1857, 2 ème série, T. XIX, p. 292) had two such successes, and that M. MAILLEFER also practised the operation. Indeed, M. CHENU (*Rapport, etc., Camp. d'Orient*, 1865, p. 291) details by name the cases of twenty-six (26) French Crimean pensioners who had undergone disarticulation at the elbow, and mentions a twenty-seventh case of recovery, the patient being discharged cured. But, in his tabular statement, M. CHENU gives the formidable offset of fifty-two (52) deaths (p. 289), instead of twenty-one deaths as recorded by M. LEGOUEST; but it seems impossible to arrive at a precise estimate of the total number of the operations and their results, unless the statements of the official reporter, M. CHENU, be accepted,—*i. e.*, seventy-nine operations with fifty-two deaths, or a mortality rate of 65.8 per cent. M. SALLERON, after the Italian War of 1859, is said (UHDE, *l. c.*, p. 66) to have had three amputations at the elbow, with one death. Signor PARAVICINI had one successful and one fatal case in the same campaign (PARAVICINI, *L'Ospitale militaire a Santa Maria di Loreto*, etc., Milano, 1860, p. 27); and DEMME (*Studien*, u. s. w., 1861, S. 237, Dritter Fall) records another successful case, in a soldier wounded at Solferino. In his *Campagne de Kabylie*, 1854–6–7, Paris, 1862, p. 317, M. A. BERTHERAND tabulates two amputations at the elbow, one resulting fatally. CHENU (*Camp. d'Italie, op. cit.*, 1869, T. II, p. 609) tabulates six cases of disarticulation at the elbow for shot injury, with five deaths; two of the cases just cited from SALLERON are probably included in this return. UHDE (C. W. F.) (*Die Abnahme des Vorderarms in dem Gelenke*, Braunschweig, 1865, S. 51) records a primary successful exarticulation at the elbow in the case of Severidt, aged 24 years, wounded by machinery, August 28, 1862, and, in the following year (*l. c.*, S. 56), the same surgeon reports an unsuccessful operation in the case of a woman of 34 years, injured by machinery, October 12, 1863. M. MARTENOT, of Lyons, communicates to Dr. UHDE (*l. c.*, S. 56) a successful secondary exarticulation at the elbow, June 14, 1863, for compound fracture three months previously. BECK (B.) (*Chir. der Schussverletzugen*, 1872, S. 143) records a successful intermediary amputation at the elbow for comminution of the radius followed by uncontrollable haemorrhage. HORWITZ (P. J.) (*Annual Rep. of the Chief of the Bureau of Medicine and Surgery of the United States Navy for* 1863) records two successful amputations at the elbow practised by naval medical officers during the Rebellion. SOCIN (A.) (*Kriegs.-chir. Erfahr.*, 1872, S. 153) records two successful exarticulations at the elbow at the hospital at Carlsruhe. Dr. J. C. CHENU, in his *Aperçu Hist. Stat. et Clin. pendant la guerre* 1870–71, Paris, 1874, T. I, p. 492, tabulates an extraordinary number of 133 disarticulations at the elbow for the effects of shot injury, with 101 deaths, or the excessive death-rate of 75.9 per cent. Probably the cases referred to in the following authors are included in M. CHENU'S appalling return: TACHARD (E.) (*Reflexions servir à l'histoire de la chir. en campagne, Gaz. des Hôp.*, 1871) enumerates five cases of amputation at the elbow, with three deaths. MACCORMAC (W.) (*Notes, etc., op. cit.*, p. 95) records two secondary fatal elbow amputations at Asfeld, in October and November, 1870. M. LEPLAT (in *Grellois, Hist. Méd. de Blocus de Metz*, 1872, p. 348) mentions two successful amputations at the elbow, at the ambulance de l'esplanade. M. ARNAUD (*Ibid.*, p. 353) records two successful exarticulations at the elbow at the engineer barracks.

In several instances, there were complaints that the stumps formed by disarticulation at the elbow were ill-suited for the adaptation of an artificial limb:

Case 1837.—Sergeant S. C. Clobridge, Co. G, 115th New York, aged 22 years, was wounded in the right forearm at Chapin's Farm, September 29, 1864. He was admitted to the field hospital of the 2d division, Tenth Corps, where amputation at the elbow joint was performed. On the following day he was admitted to the base hospital at Point of Rocks, where Surgeon H. P. Porter, 10th Connecticut, noted: "Gunshot wound of arm. Patient transferred to General Hospital October 26th." Assistant Surgeon E. McClellan, U. S. A., reported his admission to the Fort Monroe Hospital on October 27th, with "amputation of right arm," and his departure from the hospital "on furlough January 27th." Three months afterward the patient entered Ira Harris Hospital, Albany, whence Assistant Surgeon J. H. Armsby, U. S. V., contributed the cast represented in the annexed wood-cut (Fig. 660). On July 18, 1865, the patient was discharged from service and pensioned. Several weeks afterward he was furnished with an artificial limb by the National Leg and Arm Company, of New York. In a communication dated Albany, New York, August 10, 1866, the pensioner recounted the facts of his case as follows: "I was wounded by a piece of a shell, the larger part of my right forearm being completely carried away, resulting in the amputation of my arm at the elbow (unjointed). I was immediately taken to the field hospital, about one mile distant, where Surgeon C. Macfarlane, of my regiment, performed the operation of amputation. The operation was circular, and said by many to be a good one. I was then sent to City Point, where my arm was treated by different surgeons whose names I am not acquainted with; the attention I received there was the very best. The dressing consisted of oakum and cold water. After about two weeks treatment at this hospital I was sent to Fortress Monroe, where—I am very sorry to say—I received poor care from both doctors and nurses. I was soon attacked with gangrene, which had the awful effect always following that disease. They then used a wash termed disinfectant, which soon checked the disease, but not until about one-half inch of the entire end of the stump had sloughed off, leaving my arm in a much worse state than when first amputated. Creasote was then used freely by one doctor, while another bandaged with cold water; the latter process I liked the best. They soon, however, commenced to use simple syrup, which was the principal dressing used till my arm healed. It was about the middle of February, 1865, when I received a furlough to visit my home at Saratoga. On my arrival home I found that my arm was much worse than when I started from Fort Monroe, being on the road so long without dressing it. The proud flesh showed itself, for which the doctor applied caustic. But my arm not seeming to do well at all, I effected a transfer to Albany, where I received treatment at the Ira Harris U. S. A. General Hospital. * * * My arm is now healed, but very tender from the effects of the gangrene. * * * For this reason my artificial arm is of no possible use to me. I have now had it about one year, but have not worn it more than a dozen times at the most." Drs. Ferguson, Smith, and Hogan, of the New York City Examining Board, December 9, 1874, certified: "The right arm has been amputated through the elbow joint." This pensioner was paid September 4, 1875.

Fig. 660.—Cast of stump of right arm after amputation at the elbow. *Spec.* 2854.

Case 1838.—Private J. Caseman, Co. D, 25th Kentucky, aged 32 years, received a gunshot wound of the left forearm at Nashville, October 3, 1863. He was admitted to Hospital No. 8, whence Acting Assistant Surgeon O. J. Vincent contributed the following detailed history: "He was shot by a drunken guard at the barracks, and was immediately brought to this hospital for treatment. There had been considerable hæmorrhage. The wound was through the upper third of the forearm, the radius being shot through, cutting it off, and the ulna shot through; the radial and interosseous arteries wounded. Amputation was decided upon. Administered tincture of opium a drachm and whiskey two ounces. After the patient had rallied, chloroform was given, and amputation at the elbow performed by Acting Assistant Surgeon T. J. Karber, as follows: Anterior flap taken from forearm; internal condyle and portion of outer condyle sawed off, leaving the olecranon with the triceps attached; vessels well secured after the posterior flap was made; flaps adjusted and secured by sutures. The patient bore the operation well, was placed in bed, given tincture opii one-half drachm and spirits two ounces, and permitted to rest. October 4th, patient rested well through the night; has some fever this morning; tongue coated; gastric irritation with vomiting; pulse accelerated; arm somewhat swollen; pain slight; bowels constipated. 5th, constipation continues, also the gastric irritation; tongue furred; headache; thirst; fever. Gave an enema of salt and water. 6th, gastric irritation continues, also fever and furred tongue; suppuration commenced. Gave enema of salt and water. Slight evacuation of bowels took place. Gave two ounces of sulphate of magnesia and dressed arm with cold water. 7th, full evacuation of bowels has taken place; patient feels better; symptoms of excitement subsiding; suppuration continues with considerable fetor; some sloughing at corresponding point with the inner condyle. Used a wash with chlorinated solution of soda and continued the dressing. 8th, fever subsiding; suppuration increasing and fetid. Continued the dressing. No changes were made in the treatment, the wound doing well up to October 21st, when the ligatures came away, and the wound was dressed with adhesive straps. 27th, patient somewhat restless; hardness and soreness near the point of the inner condyle. 28th, patient has had a severe chill; erythema on posterior portion of arm; fever; nausea; headache; furred tongue; rapid pulse and thirst. Gave pills of mercury eight grains. 29th, patient has had another severe chill. Dressed the arm with cloths saturated with a mixture consisting of camphor water one pint, tincture opii one ounce, and glycerine two drachms. 30th, gave sulphate of magnesia two ounces. Patient has evacuation of bowels. Erythema extends to back; arm is better. 31st, erythema extends still farther and to opposite side of back. Continued dressing, and gave sulphate of quinine twelve grains per diem. Wound improving. November 1st, case convalescing; patient feels comfortable. 18th, patient has been improving gradually up to the present date." Surgeon W. C. Otterson, U. S. V., in charge of the hospital, reported that the patient left "on furlough January 25, 1864." He entered the Marine Hospital, Cincinnati, February 6th, and was discharged from service May 18, 1864, and pensioned. In his application for commutation for an artificial limb he described the stump as having "shrunk away very considerably." The pensioner died September 24, 1874.

The next case illustrates the group in which disarticulation at the elbow is required, in artillerymen using the rammer, by disorganization of the forearm from the premature explosion of a cannon. The patient submitted to secondary disarticulation at the shoulder:

CASE 1839.—Private C. H. Alexander, Battery B, Maryland Light Artillery, aged 35 years, was wounded at Malvern Hill, July 1, 1862. Acting Assistant Surgeon J. A. Draper furnished the following history from Chester Hospital: "While loading one of the guns it accidentally went off, carrying away the greater portion of his right forearm. The remaining portion of the shattered bones were taken off by an amputation at the elbow joint, in which the operator removed the olecranon process but left the condyles intact. The next morning the patient was taken prisoner and removed to Richmond, where he remained three weeks. He was admitted to this hospital on the 29th of July. According to the patient's statement, he had no power whatever over the arm since receiving the injury, and the stump had been exceedingly painful since the operation. When admitted, the stump was in a swollen and exceedingly painful condition, with a discharge sometimes of a sanious and sometimes of a serous character. After a long and careful course of treatment by Acting Assistant Surgeon L. Fassitt, the stump healed and became reduced to its natural size, but the patient gained no power over the limb. Dr. Fassitt having gone away, the patient came under my care about the 1st day of October. I found the stump still very painful, so much so that the patient could sleep only when under the influence of morphia. The deltoid muscle was greatly atrophied, the capsular ligament completely relaxed, and the stump, so far as motion was concerned, hung dead by the patient's side. On consultation with the surgeons attached to the hospital it was thought proper to amputate at the shoulder joint. The operation was performed by the oval flaps of Larrey, on the 9th of October. The flaps were closed in the ordinary manner, and dressed with a wash containing acetate of lead and opium. The patient has steadily recovered without an untoward symptom. On dissecting the stump the radial nerve was found bulbous from the lower end to above the middle of the arm, and the ulnar nerve pressed against the inner condyle by the adherent skin." The specimen, represented in the adjacent wood-cut (FIG. 661), was contributed by the operator; and the lower half of the humerus only is preserved, the extremity being somewhat eroded, while on the posterior surface of the outer condyle there is a thin deposit of callus. The patient was discharged from service January 31, 1863, and pensioned. He was paid September 4, 1875. I has been ascertained that Assistant Surgeon J. S. O'Donnell, Purnell's Maryland Legion, was the operator at the first amputation. [Compare the entry of this case, in TABLE XLVIII, Case 1, p. 647.]

FIG. 661.—Lower half of right humerus after disarticulation at the elbow. *Spec* 271.

Among the primary disarticulations there were three other examples of re-amputations; these were in the continuity, one intermediary and two secondary—one at the middle and two at the upper thirds.[1]

Intermediary Disarticulations.—Five patients submitted to early intermediary disarticulation at the elbow; two were amputated on the third, one on the fifth, one on the seventeenth, and one on the twenty-first day from the date of injury. All recovered; but, in the following instance, only after submitting to secondary amputation at the shoulder joint. Four were discharged and pensioned; the fifth, Bush, was a deserter when wounded.

CASE 1840.—Private J. C. Eldridge, Co. H, 4th Tennessee Cavalry, aged 20 years, was wounded in the left forearm and hand by the accidental discharge of his pistol, while disembarking with his regiment from a steamer at Memphis, February 16, 1865. He was admitted to the Washington Hospital, where he was operated on by Surgeon D. Stahl, U. S. V., who made the following report: "The ball entered at the posterior surface of the forearm, lower third, and emerged at the upper end of the metacarpal bone of the thumb, causing compound fracture of the ulna, radius, and carpal bones, the ulna being very badly shattered and split up. March 5th, constitutional condition of patient very debilitated and showing typhoid symptoms; pulse 130, small and weak; tongue dry; the wound discharging an offensive sanious fluid. Amputation at the elbow joint was performed by circular operation. Hardly any hæmorrhage occurred. Chloroform was used, and three ligatures were applied. The patient reacted promptly. The treatment consisted of punch and porter and cod-liver oil. The wound was dressed with permanganate salts." On May 15th, the patient was transferred to the Gayoso Hospital, where he was mustered out of service September 12, 1865. In his application for pension he stated that, owing to gangrene having set in, the arm was re-amputated by the same operator—Surgeon Stahl—at the shoulder joint, on June 28, 1865. Drs. T. H. Roddy and C. H. Smith, of Hamilton county, Tennessee, December 22, 1866, certified that they carefully examined Eldridge and found that he had suffered "amputation at the left shoulder joint." The pensioner was paid September 4, 1875.

Four of the intermediary disarticulations were on the left, and one on the right side. In one of the intermediary cases (CASE 6, TABLE XXII) symptoms of tetanus supervened, which were relieved, by Acting Assistant Surgeon Bowen, by division of the median nerve, which had been included in the ligation of the brachial. An interesting abstract of this case has been published.[2]

[1] Viz: CASE 29, p. 914, of Pt. H. Peters, 4th Artillery: compare CASE 165, TABLE LXXVI, p. 757;—CASE 6, of Serg't W. H. Bower, 1st New York Artillery: compare CASE 11, TABLE LXXXIV, p. 777;—CASE 18, of Pt. C. Herman, 1st Massachusetts: compare CASE 61, TABLE LXXXVI, p. 785.

[2] BUTLER (W. H.), *Remarks on Tetanus, with Histories of Nine Cases*, in *Am. Med. Times*, 1863, Vol. VII, p. 159.

Secondary Disarticulations.—There were two secondary disarticulations at the elbow. One (CASE 4, TABLE CXXII) a fatal case, reported without details. The other, narrated below, was a re-amputation on account of gangrene, with protrusion of the ends of the ulna and radius, after an intermediary amputation in the forearm, which failed to arrest the progress of gangrene following a shot wound of the fingers. A sound stump resulted from the disarticulation at the elbow. The two secondary operations were of the right elbow.

CASE 1841.—Private M. Burroughs, Co. A, 148th New York, aged 18 years, was wounded at Cold Harbor, June 2, 1864. Assistant Surgeon C. A. McCall, U. S. A., reported his admission to Mount Pleasant Hospital, Washington, June 6th, with "Gunshot wound of right hand." On June 10th, the patient entered McDougall Hospital, New York, where Acting Assistant Surgeon F. H. Hamilton, jr., recorded the following history: "He was wounded by a rifle ball entering the hand on the palmar surface, passing obliquely through, and making its exit on the dorsum. The metacarpal bones of the little and ring fingers were broken and badly comminuted. The wound looked well until the 15th of June, when it was attacked with hospital gangrene. On the first examination of the condition of the wound sloughing had produced an ulcer two inches in diameter, and the hand and forearm were much inflamed. Pure nitric acid was applied twice, which nearly arrested the disease. On June 27th, the patient was seen by Assistant Surgeon H. M. Sprague, U. S. A., in charge, and amputation being advised, it was performed by him the same day. The operation was by double flaps at the lower third of the forearm. The constitutional state of the patient at the time of the operation was in good condition and not much reduced. The stump looked well until about the 2d of July, when it was discovered that gangrene was present and the sutures had given away. The stump was laid open and the bones bare, and pure nitric acid applied, which stayed the progress somewhat. July 16th, since the last application of nitric acid—on July 2d—two applications have been made of bromine one part to three parts alcohol. The bones are now protruding one inch and the gangrene is nearly arrested. The general state of the patient is not very much prostrated, considering the nature of the wound and its result. He is receiving generous diet, with tonics and stimulants." Re-amputation was subsequently performed at the elbow joint, the precise date of which operation has not been ascertained. The patient was discharged from service August 26, 1864, by reason of "loss of right forearm, amputated at the elbow joint." In the following year he was furnished with an artificial forearm by J. M. Grenell & Co., of New York, who in their surgical statement described the case as a "flap amputation at the elbow joint." In his application for commutation the pensioner stated that he wore the artificial limb only a few times; that it was heavy and made the stump sore, etc.; also that the stump was then—in 1870—in a sound condition. Assistant Surgeon Sprague, the operator at the first amputation in this case, is also alleged by the pensioner as having performed the subsequent disarticulation at the elbow joint. The pensioner was paid September 4, 1875.

Disarticulations of Uncertain Date.—In five of the amputations at the elbow, the period intervening between the date of injury and operation could not be ascertained. Two of the disarticulations were on the right and two on the left side. In the fifth case, this point was not noted. One case, a shot comminution of the ulna, proved fatal.

RECAPITULATION.—Of forty patients who submitted to disarticulation at the elbow for shot injury, thirty-six recovered, three died, and the ultimate history of one case could not be traced. Eighteen operations were on the left, twenty-one on the right side, and one undetermined. Circular and flap incisions were employed in about equal proportion in the instances in which the method of operation was mentioned. Thirty-six of the patients were Union, and four Confederate soldiers. The forty cases of the four groups appear below:

TABLE CXXII.

Summary of Forty Cases of Amputation at the Elbow Joint for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	REMARKS.
1	Adams, I. R., Pt., D, 11th Michigan, age 18.	Sept. 20, 1863.	Grapeshot wound of right forearm; tissues disorganized.	Sept. 23, 1863.	Circular amputation	Discharged November 1, 1863; pensioned.
2	Adams, L., Pt., A, 20th New York, age 21.	April 2, 1865.	Compound comminuted fracture of right forearm, involving elbow joint, by shell.	April 2, 1865.	Flap amputation; extensive slough; much constitutional prostration.	Discharged August 30, 1865; pensioned. Healthy stump.
3	Alexander, C. H., Pt., Battery B, Maryland Light Artillery, age 35.	July 1, 1862.	Right forearm carried away. Compare CASE 1, TABLE XLVIII, p. 647.	July 1, 1862.	Amputation, by Asst. Surg. J. S. O'Donnell. See CASE 1839, p. 912.	Oct. 9, re-amputation at shoulder joint. Discharged Jan. 31, 1863; pensioned. A. M. M., *Spec.* 271.
4	Allen, N. P., Pt., H, 22d Illinois.	Dec. 31, 1862.	Fracture of right radius and ulna.	March, 1863.	Amputation at elbow.....	Died March 16, 1863.
5	Ballman, A., Corp'l, C, 52d New York, age 38.	May 18, 1864.	Shot wound of left forearm, involving elbow joint.	May 18, 1864.	Amputation, by Surg. M. Fraehlich, 52d New York.	Furloughed July 7, 1864. Not a pensioner.
6	Bower, W. H., Serg't, L, 1st New York Light Artillery, age 35.	Aug. 21, 1862.	Shell fract. of left forearm. See CASE 11, TABLE LXXXIV, p. 777.	Aug. 21, 1862.	Flap amputation.	Stump healed. Disch'd Nov 10, 1862; pens'd. Re-amputation.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
7	*Boutright, J.*, Pt., G, 2d Louisiana.	1862.	Shot wound of left forearm....	1862.	Amputation at left elbow.....	Furloughed October 8, 1862.
8	Burgin, J., Pt., B, 22d Indiana, age 35.	Oct. 8, 1862.	Shot wound of right forearm..	Oct. 10, 1862.	Amputation, by Surgeon G. W. Phillips, 75th Illinois.	Discharged Dec. 28, 1862; pensioned. Stump healthy.
9	Burroughs M., Pt., A, 148th New York, age 18.	June 2, 1864.	Comminuted fracture of metacarpal bones.	June 27, 1864.	Amputated by Asst. Surg. H. M. Sprague, U. S. A. See Case 1841, p. 913.	Discharged August 26, 1864; pensioned.
10	Bush, E., Pt., A, 104th New York, age 24.	Nov. 23, 1863.	Ball entered between the radius and ulna at left wrist; intense pain and swelling; colliquative diarrhœa.	Dec. 14, 1863.	Antero-posterior flap operation, by Surg. E. Bentley, U. S. V.	Discharged April 20, 1864. Rejected as a pensioner.
11	Caseman, J., Pt., D, 23d Kentucky, age 32.	Oct. 3, 1863.	Fracture of left radius and ulna.	Oct. 3, 1863.	Amp'd, by A. A. Surg. T. O. Karber. See Case 1837, p. 911.	Discharged May 18, 1864; pensioned. Died Sept. 23, 1874.
12	Clobridge, S. C., Serg't, G, 115th New York, age 18.	Sept. 29, 1864.	Portion of right forearm carried away by a shell.	Sept 29, 1864.	Amputation, by Surg. C. Macfarlane, 115th New York.	Discharged July 18, 1865; pensioned. Case 1838, p. 911.
13	Burkee, J. H., Capt., A, 146th New York, age 26.	May 1, 1863.	Frac. of both bones left forearm and divis'n of ulnar and radial arteries: also w'd of abdomen.	May 2, 1863.	Circular amputation, by Dr. Todd, 52d Georgia, and Dr. Watts, of North Carolina.	Discharged May 17, 1864; pensioned.
14	Eldridge, J. C., Pt., H, 4th Tennessee Cav., age 20.	Feb. 16, 1865.	Shot frac. left ulna, radius, and carpal bones by pistol ball.	Mar. 5, 1865.	Circular amputation, by Surg. D. Stahl, U. S. V.	Discharged September 12, 1865, pensioned.
15	Gallagher, P., Pt., I, 1st Infantry.	June 15, 1863.	Shell wound of left forearm ..	June 15, 1863.	Amputation, by A. Surg. J. W. Van Brunt, 103d Illinois.	Discharged August 27, 1863; pensioned. Sound stump.
16	Gates, A., Pt., I, 97th New York, age 35.	May 10, 1864.	Shot wound of left hand; metacarpal bones badly comminuted. May 10, amp. fourth finger; hand and lower third of forearm gangrenous; arm œdematous to shoulder.	May 15, 1864.	Amputation, by Surgeon E. Bentley, U. S. V., by circular flaps; five ligatures applied.	Discharged September 2, 1864; pensioned. Healthy stump.
17	Gould, G. W., Pt., I, 8th New York H. A., age 21.	June 16, 1864.	Shot fracture of left forearm, involving elbow joint.	June 16, 1864.	Ant.-post. flap amputation, by Surg. M. F. Regan, 164th N. Y.	Disch'd Oct. 22, 1864; pensioned. Stump very tender (1870).
18	Herman, C., Pt., E, 1st Massachusetts, age 44.	June 30, 1862.	Shot wound of right forearm..	June 30, 1862.	Amputation at elbow joint. See Case 61, Table LXXXVI, p. 785.	Discharged Sept. 5, 1862; pensioned. Re-amputated in middle third; good stump.
19	Hinkle, R., Corp'l, F, 67th Ohio, age 24.	Oct. 13, 1864.	Shot fracture of right forearm	Oct. 13, 1864.	Amputation, by Surg. J. Westfall, 67th Ohio.	Discharged April 8, 1865; pensioned. Good stump.
20	Johnson, W. C., Pt., B, 4th Delaware, age 50.	Feb. 28, 1863.	Shot wound of right wrist, passing toward elbow.	Feb. 28, 1863.	Amputation, by Surg. D. S. Hopkins, 4th Delaware.	Discharged May 17, 1863; pensioned. Stump healed.
21	Kress, W. B., Pt., H, 75th Indiana, age 30.	June 18, 1864.	Shot fracture, involving right elbow joint.	June 18, 1864.	Amputation, by Surgeon C. S. Arthur, 75th Indiana.	Disch'd Nov. 29, 1864; pensioned. Stump perfectly sound.
22	Kurtz, M., Pt., I, 53d Pennsylvania, aged 20.	May 12, 1864.	Fracture of right ulna, implicating elbow joint.	May, 1864.	Amputation at elbow joint....	Died June 3, 1864, from exhaustion.
23	*McAuliffe, J.*, Pt., I, Cobb's Legion.	1864.	Shot wound.....	1864.	Amputation at right elbow joint.	Furloughed November 18, 1864.
24	McDavitt, C., Pt., K, 19th Massachusetts, age 25.	Dec. 13, 1862.	Shot compound comminuted fracture of both bones of right forearm; also flesh wound of left leg.	Dec. 14, 1862.	Circular amputation, by Surg. N. Hayward, 20th Massachusetts. See Case 1836, p. 910.	Disch'd May 28, 1863; pensioned. Stump healed but tender; lameness of left leg.
25	Montgomery, T., Lieut., A, 170th New York, age 28.	May 18, 1864.	Wound of left forearm by a cannon ball. (Wound of neck, July 1, 1861.)	May 18, 1864.	Amputation.....	Discharged October 18, 1864; pensioned. Stump healed.
26	Moore, H. G., Pt., K, 148th Pennsylvania, age 33.	June 3, 1864.	Comminution of bones of right forearm by shell and laceration of soft tissues.	June 3, 1864.	Flap amputation, by Surgeon G. L. Potter, 145th Pennsylvania.	Discharged June 1, 1865; pensioned. Sound stump.
27	Murphy, J., Serg't, E, 47th New York, age 23.	Aug. 16, 1864.	Shell wound of middle third of left forearm, fracturing bones to elbow joint; joint opened.	Aug. 16, 1864.	Amp'n at elbow joint and condyles of humerus removed, by Surg. J. R. Everhart, 97th Pa.	Disch'd July 7, 1865; pensioned. Stump very tender (1870).
28	Newman, E., Pt., A, 8th N. Y. Heavy Art., age 19.	June 3, 1864.	Shell wound of right forearm.	June 4. 1864.	Amputation by circular incisions, by Surg. C. H. Pegg, 8th New York Heavy Art.	Disch'd Jan. 28, 1865; pensioned. Stump sore and tender (1870).
29	Peters, H., Pt., D, 4th Art., age 22.	Jan. 30, 1863.	Shell wound of left forearm ..	Jan. 30, 1863.	Flap amputation at elbow joint. Sloughing. See Case 165, Table LXXVI, p. 757.	Feb. 16, re-amp. in upper third by flap. Disch'd July 28, 1863; pensioned; stump healed.
30	Pullem, F., Pt., A, 109th Colored Troops, age 21.	Dec. 5, 1864.	Shot fracture of left wrist and forearm.	Dec. 8, 1864.	Amputation.....	Discharged April 14, 1865; pensioned. Good stump.
31	*Rowan, S. W.*, Corp'l, A, 2d South Carolina.	1862.	Shot wound.....	1862.	Amputation at left elbow joint.	Furloughed December 19, 1862.
32	Selley, G., Pt., B, 117th New York, age 48.	Jan. 15, 1865.	Shot fracture of upper third of left forearm.	Jan. 15, 1865.	Circular amputation, by Surg. G. C. Jarvis, 7th Connecticut.	Disch'd Aug. 2, 1865; pensioned. Died July 27, 1869.
33	*Sexton, S. J.*, Pt., H, 2d North Carolina Battery.	July, 1863.	Wound.....	1863.	Amputation at elbow joint...	.....
34	Spaulding, E. A., Pt., K, 8th N. Y. Heavy Art., age 17.	June 3, 1864.	Fracture of right forearm by minié ball.	June 3, 1864.	Flap amputation, by Surg. M. Rizer, 72d Pennsylvania.	Discharged October 3, 1864; pensioned. Sound stump.
35	Stoltz, B., Lieut., A, 15th New York Art., age 38.	Mar. 31, 1865.	Shot fracture of left forearm..	Mar. 31, 1865.	Circular amputation, by Surg. T. M. Flandrau, 146th N. Y.	Discharged July 8, 1865; pensioned.
36	Stone, E. J., Pt., H, 1st New York Artillery, age 25.	June 18, 1864.	Right forearm blown off by explosion of gun.	June 18, 1864.	Amputation, by Asst. Surg. C. F. Haynes, U. S. V., by the oval flap method.	Discharged Aug. 26, 1864; pensioned. Healthy stump.
37	Sullivan, J., Pt., A, 30th Michigan.	April 10, 1865.	Right forearm blown of by premature discharge of cannon.	April 10, 1865.	Amputation, by Surg. J. Willett, 30th Michigan.	Discharged June 30, 1865; pensioned. Healthy stump.
38	Truair, A. N., Pt., M, 8th N. Y. Heavy Art., age 43.	June 3, 1864.	Compound comminuted fracture of right radius and ulna.	June 3, 1864.	Flap amputation, with removal of internal condyle of humerus, by Asst. Surgeon C. H. Pegg 8th New York H. A.	Discharged December 6, 1864; pensioned. Sound stump.
39	Vivlamore, F., Pt., M, 6th N. Y. Artillery, age 23.	July 12, 1864.	Right ulna shattered, radial artery lacerated, and extensive laceration of soft parts.	July 12, 1864.	Amputated by the lateral flap method, by Surg. C. H. Porter, 6th N. Y. Artillery.	Disch'd Mar. 18, 1865; pensioned. Stump sound but tender.
40	Wimpdler, S., Pt., C, 9th Ohio.	Nov. 25, 1863.	Shot wounds of left forearm and foot.	Nov. 25, 1863.	Amputation at elbow joint, and leg at lower third.	Died December 9, 1863.

The Chief of the Bureau of Medicine and Surgery of the United States Navy has published[1] two cases of disarticulation at the elbow practised with success by naval medical

[1] Horwitz (P. J.). *Annual Report of the Chief of the Bureau of Medicine and Surgery of the United States Navy for* 1866, embracing a statement of the casualties in the Navy from 1860 to 1866.

officers during the War; but without further particulars. Medical Inspector F. Sorrell, C. S. A., reported[1] seven cases of disarticulation at the elbow for shot injury practised in the hospitals of the Confederate Army of Northern Virginia at the close of 1863, with two fatal results. There were four primary operations with one death, and three secondary operations with one death. The recorded experience of the War on this point from all sources, therefore, sums up forty-nine cases, with five deaths and one undetermined result.

Concluding Observations on Injuries of the Elbow.—Of the third mode of treatment of shot injuries at the elbow,—by amputation in the continuity of the arm,—which was adopted in nearly one half of the cases we have reviewed, since the subject has been fully discussed in Section IV of this Chapter, I will not revert further than to point out that the fatality of the amputations practised for injury of the elbow joint was slightly greater than the mortality rate of amputations done for injuries of the upper arm or forearm, as there were two hundred and seventy-two deaths in eleven hundred and nineteen determined cases. Doubtless the constitutional reaction is much graver when a large joint is penetrated than when the injury is confined to the continuity. Moreover, a large proportion of the amputations for elbow joint injuries are practised at the lower third of the arm, where, as we have seen, amputations give undeniably less favorable results than at the upper third,—a curious fact, partly explicable, perhaps, by the anatomical complexity of the tissues divided in the section just above the elbow, as shown in M. Anger's cut, Figure 656, on page 906.

Comparing the three methods of dealing with shot injuries of the elbow, by expectation, excision, and amputation, we observe that many surgeons accept the rule presented on the high authority of Professor Esmarch,[2] that "in all injuries of this kind it is the duty of the surgeon to assist nature by an operation." But facts adduced in the first part of this Section prove that there are many exceptions to this rule; and while, on page 844, the reader has been warned not to exaggerate the favorable results which statistical returns assign to the expectant plan, it would appear that in numerous instances it is nevertheless justifiable to adopt that plan, a view to which several surgeons of the widest experience on the subject now incline.[3] Indeed the present danger would seem to be that the early brilliant successes obtained by excision may cause that mode of treatment to be overrated,

---

[1] Sorrel (F.) (*Report on Gunshot Wounds*, in *Confed. States Med. and Surg. Jour.*, 1864, Vol. I. p. 153). Surgeon J. J. Chisolm, P. A. C. S., gives the same report (*Manual of Mil. Surg.*, 3d ed., 1864, p. 361) as including the cases reported from all of the Confederate armies to February 1, 1864.

[2] Esmarch (F.) (*Ueber Resectionen nach Schusswunden*, Kiel, 1851, S. 77) says: "Halten wir es für die Pflicht des Wundarztes, bei allen Verwundungen dieser Art der Natur durch eine Operation zu Hülfe zu kommen." And Dr. Stromeyer's precept is equally unqualified: "In *all cases* where I recognized a [shot] injury of the bones of the elbow joint, I did not hesitate to allow the resection of the joint to be performed" (*Über die bei Schusswunden vorkommenden Knochen-Verletzungen*, Freiburg, 1850, S. 36), and further on (S. 38): "Je mehr Resectionen des Ellenbogengelenks ich selbst machte, oder unter meiner Aufsicht machen liess, desto weniger konnte ich mich dazu entschliessen, Zerschmetterungen des Ellenbogengelenks durch Kugeln der Natur zu überlassen, wie Guthrie dies zuweilen gethan zu haben scheint." And Maas (H.) (*Kriegschir. Beiträge aus dem Jahre 1866*, Breslau, 1870, S. 82) insists that "Shot fractures of the elbow joint without exception demand the resection of the joint." Professor Albert Lücke, of Bern, also (*Kriegschir. Fragen und Bemerk.*, 1871, S. 44) seems disposed to reject expectant conservative treatment altogether. He puts the question thus: "What can be accomplished by expectant treatment? What by excision at the elbow joint? Under the former method, the healing process is undoubtedly very slow. This might unconditionally be submitted to, if better end-results were obtained. But in the most favorable cases we only achieve a stiff joint with the limb in a favorable position, by this treatment; and the more the bone is comminuted, the greater the extent of callus formation, and the function of the joint is destroyed. Excision, opportunely practised, preserves the functional mobility of the joint, promotes quick healing, and lessens the danger from consecutive bleeding and suppuration. There are cases of anchylosis after elbow resection, it is true; but they are infrequent. There are also those bugbears, the dangle-joints, so sedulously held up to ridicule by the opponents of excision. But, in my experience, these never occur *except* from great carelessness in the after-treatment, as in the instance of the Danes, resected in 1864, by the Prussian surgeons. I consider the point, already adverted to by Ollier of employing early ferudization of the muscles very important."

[3] Langenbeck (B. v.) (*Chirurgische Beobachtungen aus dem Kriege*, Berlin, 1874, S. 163) remarks that: "The numerous cases of the last wars indicate that there must be many shot injuries of the elbow joint where resection can be avoided, and it is to be deplored that we generally do not soon enough learn the nature of the injury in such cases." Ruppreciit (L.) (*Militärärztl. Erfahrungen*, Würzburg, 1871, S. 68) observes: "It is easy, after a complete shot comminution of the elbow joint, to decide on amputation in the continuity, or, if the splintering does not extend too far, to resort to primary resection (which I prefer to delayed operations, whether complete or partial excision be contemplated); nevertheless, it is to be deplored that the advantages of resection should ever be so enthusiastically regarded, and the dangers of inflammatory reaction of these injuries viewed with such exaggerated apprehension, as to lead to the danger that the expectant conservative treatment of such injuries should be liable to exist only in name."

and the resources of expectation and amputation to be undervalued. That excision should *always* be preferred to amputation in shot injuries of the elbow cannot be conceded. Apart from the graver lacerations by large projectiles, which render amputation imperative, there are many cases in which longitudinal fissuring of the shaft of the humerus, or lesions of the vessels and nerves, render immediate amputation advisable; for the cases in which it is alleged that excision has succeeded after ligation of the brachial are not sufficiently numerous or explicit to be accepted as precedents; and there is not a reasonable prospect of success by resection when the bones are crushed for some distance from the joint, or when the circulation and innervation are seriously disturbed and would be further impaired by the necessary interference with the collaterals in the course of the incisions for resection. Some surgeons, on the erroneous assumption that the extent of the lesions always corresponds with the magnitude of the projectiles inflicting them, would make the nature of the missile the criterion in deciding between excision and amputation.[1] While it is desirable to be as sparing as possible in the resection of the joint ends, and to respect the muscular attachments as much as practicable, and partial excisions[2] may possibly be sometimes justifiable, as a rule they are inadvisable, and, at all events, should not be practised without that free division of the ligamentous attachments of the joints, which mainly deprives the wound of its danger. That primary excisions are preferable to deferred operations, is as well established as the superiority of primary amputations.[3] The general rules for the management of shot injuries of the elbow I have sought to formulate below.[4]

[1] Dr. ANTONIO RESTELLI (*Note ed Osservazioni cliniche di chirurgia militare*, in *Ann. univers. di Medicina*, 1849, Vol. CXXX, Fasc. 389, p. 241) appears to assume that, while all shot injuries of the elbow joint require operative interference, excision will suffice for injuries from musket balls, while wounds from grapeshot, shell-fragments, etc., demand amputation: "Le fratture comminutive delle estremità articolari del cubito, se da sola palla da fucile, talvolta richieggono la sola recezione, e se vi sono complicazioni o la ferita sia da mitraglia, pezzo di bomba, ecc., si deve eseguire l'amputazione."

[2] SCHÜLLER (M.) (*Kriegschir. Skizzen aus dem Deutsch-Franz Kriege*, Hannover, 1871, S. 46), after relating a partial excision at the elbow for shot injury, practised on the advice of his colleagues, adds: "I believe that facts fully justify me in the opinion that such incomplete resections are unadvisable. They lead almost uniformly to anchylosis, generally after tedious suppuration, maintained by the partially removed synovial membrane of the ridges and recesses of the joint. The peril of partial resection is probably due more to this fact than to an improperly flexed position during the after-treatment, as STROMEYER contends. In my case, at least, death ensued, although I allowed the arm to remain on the STROMEYER-ESMARCH splint in a slightly flexed position. The important feature as to prognosis in the partial resections appears to me—*where* and *how much* was resected? Whether sufficient drainage of the wound-secretions was possible, and especially whether extensive fissures and concussions exist." Professor S. D. GROSS states (*System, op. cit.*, 5th ed., 1862, Vol. II, p. 1087) that "STROMEYER and ESMARCH have conclusively shown, contrary to the opinion generally received, that partial excisions are followed by better results as regards the mobility of the joint than total operations." The professor will thank us for calling attention to this oversight. Dr. ESMARCH enforces a precisely opposite view. His language is quoted in full in the note on page 862 *ante*. He declares that "where the bones are only injured to a small extent, we ought not to be content with a partial resection of the wounded parts," etc. Dr. STROMEYER (*Ueber die bei Schusswunden*, 1850, S. 38) advises very sparing interference with the uninjured parts; but by no means advocates partial excisions, or admits that they "are followed by better results as regards the mobility of the joint than total operations." It is true that, after Langensalza, Dr. STROMEYER (*Erfahr. über Schusswunden*, 1867, S. 49) argues that with proper after-treatment good results may be had after incomplete excisions, as of the olecranon process alone. BAUDENS (*Mem. sur les plaies d'armes à feu*, in *Gaz. des. Hóp.*, 1849, T. 1, Ser. 3, p. 38) observes: "Les fractures des extrémités articulaires du coude sont à la fois des cas de résection ou d'amputation, selon la gravité de la lésion. Je pense que, si la résection peut être limitée à l'extremité articulaire de l'un des trois os du coude, il n'y a pas à hésiter à y recourir. Des deux militaires auxquels j'ai réséqué l'extrémité articulaire inférieure de l'humérus, l'un est mort un mois après l'opération, l'autre est radicalement guéri."

[3] NEUDÖRFER (J.) (*Die Endresultate der Gelenkresectionen*, in *Wiener Med. Presse*, 1871) asserts that: "In all joint injuries where the suppuration is attended with danger to life, resection is fully justifiable, even where the operation amounts to a very perilous interference and no complete cure can be anticipated. But to justify interference the danger, the hazard, to life must have actually begun. Suppuration in itself does not constitute inevitable danger to life. . . . In this view, primary resection cannot be advised, as at the outset after the injury no sign of danger to life is apparent. Favorable statistical statements of mortality of primary resection, according to my view, can never be used as an argument in favor of that operation." Which is much like arguing that a wounded artery should not be tied until the patient is in deliquium, or that a fire in a house should not be extinguished until the conflagration has made some headway.

[4] The practical conclusions that appear to me deducible from the foregoing investigations are: 1. That in shot wounds in young healthy subjects, attended with slight injury of the articular extremities of the bones of the elbow, such as fractures of the olecranon, of the outer condyle, or of the trochlea, without much splintering and without lesion of important vessels or nerves, it is justifiable, in many instances, to attempt an expectant conservative treatment, keeping the injured extremity in entire rest, after removing any detached fragments or foreign bodies, in a semi-prone and very slightly flexed position, employing ice or other cold applications. If the inflammatory action becomes intense, the wound should be freely enlarged and the joint cavity fully laid open, and easy escape provided for the altered wound secretions by position and drainage-tubes. The strength should be sustained by a tonic regimen, and when the inflammatory stage has completely abated, and not before, if healing is slow, secondary excision or amputation may be hopefully resorted to. Unless all the favorable conditions mentioned are present at the outset, it would be safer to resort to primary excision or to amputation. 2. In grave shot comminutions with lesion of the principal vessels or nerves, amputation should be practised immediately after the reception of the injury. 3. In severe shot fracture without extensive lesions of the soft parts, the joint should be freely exposed by a longitudinal posterior incision, and the full extent of the fracture ascertained. Unless there is extraordinary fissuring, the injured joint ends should then be sawn off as close to the limits of injury as possible, save that the bones of the forearm should be shortened to the same level. If the splintering extends very far, or if there is reason to believe that the humeral vessels are injured though not wounded, the incisions should be so modified as to convert the operation into an amputation.

Section VI.

WOUNDS AND OPERATIONS IN THE FOREARM.

In conformity with the plan pursued in the previous sections of this Chapter, our discussion of the returns of wounds of the forearm[1] will be restricted to those inflicted by the weapons of war or by the procedures of the surgeon. A summary of the numerous examples of burns, frost-bites, simple and compound fractures produced by other causes than shot, and other cases grouped as miscellaneous injuries, will be relegated to chapters in the Third Surgical Volume. The forearm is much exposed in action. Besides the great number of instances in which it is wounded independently, we have seen, in Chapters V and VI, how projectiles striking the chest or abdomen implicate also the forearm. It is, perhaps, more liable to sword wounds than any other region, especially when raised to protect the head or upper parts of the person. Serrier,[2] whose synoptical table on the relative frequency of shot wounds in the different regions of the body, derived from an analysis of seven hundred and eighty-four cases, is often quoted as authoritative, places the wounds of the forearm tenth in his list. From an analysis of returns[3] from the Union armies of over one hundred thousand cases of shot wounds in which the seat of injury in all wounded men brought from the field is carefully noted, it may be safely inferred that the proportion of wounds of the forearm is probably between four and five per cent. of the whole number received in action that are not immediately mortal.

[2] SERRIER (L.) (*Traité de la Nature, des Complications, et du Traitement des Plaies d'Armes à Feu*, Paris, 1844, p. 31). The 784 cases derived from the works of H. LARREY, JOBERT, LAROCHE, DUPUYTREN, BAUDENS, and others, were distributed thus: Leg, 100 cases; thigh, 97; face, 61; arm, 60; hand, 57; chest, 53; abdomen, 52; shoulder, 42; cranium, 37; forearm, 36; knee, 35; foot, 29; elbow, 23; hip, 22; neck, 22; genito-urinary organs, 18; ankle joint, 15; shoulder joint, 13; hip joint, 6; spinal column, 4; wrist joint 2.

[3] The blank form for a *Classified Return of Wounds and Injuries Received in Action*, of the Army Medical Department, is printed on p. XV of the Introduction to the First Surgical Volume. In the last year of the War it was filled up with commendable fidelity. It does not comprise the seats of injury in those killed in battle.

Punctured and Incised Wounds.—The cases found on the returns, of stabs and cuts implicating the soft tissues of the forearm, have been noticed at page 432 *et seq.* in the first Section of this Chapter; a few instances of sabre cuts involving the bones remain.

Sabre Wounds.—Seven instances were reported of sword cuts dividing one or both bones of the forearm. Two of them, associated with sabre cuts of the skull, have been already detailed.[1] Evidently the forearm, especially its ulnar border, is most exposed to sword cuts when raised to protect the head. Of the other five cases it is curious to observe that two recovered with pseudarthrosis, corroborating the old observation that sections of bone by cutting weapons[2] are slow to consolidate. LaMotte cited several instances of this,[3] and M. Legouest has observed two examples, one of which is represented in the annexed wood-cut (Fig. 662). Another instance of non-union after the division of the bones of the left arm at the lower third by a sabre, was preserved in Hutin's collection at the *Hôtel des Invalides*, in which both the ulna and radius[4] were divided.

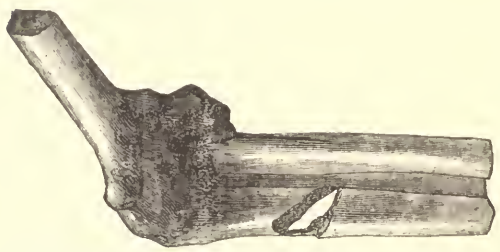

Fig. 662.—Division of the ulna by a sabre cut. [From a specimen at the Museum of Val-de-Grace, figured by M. Legouest.]

Case 1842.—Private R. R. Knapp, Co. E, 6th Cavalry, aged 23 years, received a sabre cut over the right wrist and a pistol ball in the left thigh, at Funkstown, July 7, 1863. He was captured, and his wounds were dressed by Surgeon Jackson, of the Confederate army. On August 8th, he was paroled and admitted to the hospital at Annapolis. Acting Assistant Surgeon S. J. Radcliffe reported: "A sabre wound of the right forearm one and a half inches above the articulation of the ulna, cleaving the bone through, which resulted in loss of use of the little and ring fingers." The patient was discharged at St. Mary's Hospital, Detroit, September 13, 1864, on account of "shot wound penetrating the left knee joint, resulting in permanent anchylosis; also, because of sabre wound of right forearm, producing fracture of the ulna, resulting in false joint." Examiner J. S. Hildreth, of Chicago, reported, October 30, 1867: "The bony parts have not united; the action of the hand is uninjured thereby, but the use of the wrist is, to a certain extent, impaired." On Sept. 5, 1873, the Chicago Board certified that "the ulna fracture remains ununited." The disability for the fracture of the ulna is rated three-fourths. This pensioner was paid June 4, 1875.

Case 1843.—Moses Spangler, company and regiment not reported, was wounded in October, 1862. He was admitted to the hospital at Quincy, Illinois, February 15, 1863, with a fracture of the ulna. Surgeon R. Nichols, U. S. A., reported that Spangler stated "that his arm was fractured by a blow from a rebel sword; *no union* when admitted; general health good." On March 1, 1863, a starch bandage was applied, with benefit. The patient was laboring under hypertrophy of the heart. A full diet and elixir calisaya" were prescribed. He was returned to duty May 25, 1863. No pension record.

---

[1] Cases of Sergeant T. Connolly and A. Shurey, related in Section I, Chapter I, of the *First Surgical Volume*, pp. 5 and 22.

[2] M. Legouest justly remarks (*Chir. d'Armée*, 2ème éd., 1872, p. 460): "Ces lésions sont plutôt des plaies des os que de véritables fractures."

[3] LaMotte (Guillaume Mauquest) (*l. c.*, 2e ed., 1732, T. IV, Obs. 383, 384, 385, pp. 303–315) taught by these examples that while it would be thought *a priori* that a cut bone would unite more readily than a broken bone, the reverse was true, and his explanation was that the clean section permitted the fragments to ride upon each other readily, while the asperities and irregularities of the broken bone, fitting into each other, were more conducive to immobility: "J'auvois crû qu'un os coupé auroit été infiniment plus aisé à guérir, que lorsqu'il est rompu, parce qu'étant coupé les extrêmitez de l'os se rapprochent plus facilement, et qu'étant plus unies, la matiére du callus fait mieux son effet que quand l'os est fracturé, l'inégalité des extrêmitez paroissant s'opposer à l'union; mais l'expérience m'a fait connoître que ces extrêmitez si unies se dérangent au moindre mouvement, et frottent l'une contre l'autre; en-sorte que ce callus ne se forme que tres-difficilement, par la peine qu'il y a à les tenir en repos, quelque attention que j'eusse à le faire, et le blessé à y contribuer, parce qu'il ne faut qu'une toux un peu forte, ou un eternuement, pour tout dérangeur; au-lieu qu'un os fracturé ne peut être sans inégalitez, et ces inégitez étant une fois bien réduites, elles s'enchâssent et s'emboëtent si éxactement les unes dans les autres, que la matiére du callus s'y conserve plus aisément, et a plus de facilité à en faire la réünion que quand il est coupé."

[4] In that delightful work, *The Life and Opinions of General Sir Chas. James Napier, G. C. B.*, by Lieut.-General Sir W. Napier, in Volume IV Sir Charles is reported as saying: "Hunter (General), who is here, told me a curious thing: Showing me a large sword, which cut off his arm at Bruthpoor, when leading the assault, he said that on the rampart a giant, in complete armor, whirling this sword, met him. Hunter held his sword up in defense, but, to use his own words, the giant sent it with a *whirr* into the air. Hunter then held up the scabbard, but the blow went through it and his arm just below the elbow, leaving merely *a bit of skin uncut*. He fell sitting, and held his severed arm in his right hand, while an officer tied a sash above the wound to stop the hæmorrhage; then a surgeon came up, put the *two ends together* and tied them, *and they united*." If this narrative has a flavor of the marvellous, it is easy to cite other examples of union of long bones after complete division by sabre cuts. Instances from Ravaton, Bégin, and others are cited in the foot-note on page 828. An interesting case, in which the shaft of the humerus was severed, is adduced by J. L. Schmucker (*Vermischte Chir. Schriften*, Berlin, 1785, B. I, S. 315), from a report by regimental surgeon Hoffman: A huzzar of the regiment, Möring, aged 30 years, received a sabre cut across the arm four fingers' width above the condyles, severing the humerus entirely. The ends of bone were placed in apposition, the severed muscles fastened by sutures and secured by splints, and the huzzar recovered perfectly in ten months. A still more remarkable example is communicated by Surgeon J. Stevenson, of the Madras army, in Sir George Ballingall's *Cases illustrative of Military Surgery*, in *Edinburg Med. and Surg. Jour.*, 1837, Vol. XLVII, p. 334: On August 29, 1823, Abdoo Brutheem, Jemadar of the Nabob of Masulipatam, received a sabre cut, dividing the belly of the biceps and the shaft of the humerus. The attendants described the stream of blood as profuse and projecting many feet. A turban twisted about the limb with great tightness had completely arrested the hæmorrhage. There was no pulse at the wrist. On the third day the pulse was barely perceptible and tremulous. On the thirteenth day the pulse was stronger, at 68, while in the sound arm it was at 82. The wound was cicatrized on the twenty sixth day, and, on the forty-fifth, the bone was firmly united. The arm proved of little use to him.

In the next case, it is impracticable to determine to what extent consolidation took place:

CASE 1844.—Second Lieutenant T. S. Bonney, Co. A, 129th Indiana, received a sabre wound of the left forearm at Atlanta, August 20, 1864. On November 1, 1864, he was admitted to the Officers' Hospital at Chattanooga, where Surgeon R. M. S. Jackson, U. S. V., noted: "A sabre wound of left forearm, fracturing both bones near the middle." The patient was furloughed November 5th, and discharged from the service December 24, 1864. Not a pensioner.

It is not intended to imply that pseudarthrosis, after complete division of the bones of the forearm by cutting weapons, is the rule, but simply to point out that the frequency of the complication under such circumstances is remarkable and deserving of attention.

A primary and secondary amputation of the forearm, after division of the bones by sabre cuts, are reported:

CASE 1845.—Private William Billows, Co. C, 3d New York Cavalry, aged 30 years, received a sword wound of the left forearm in a cavalry charge near Trenton, North Carolina, May 15, 1862. Surgeon D. F. Galloupe, 18th Massachusetts, states that "the radius and ulna, with nearly all the soft parts, were completely severed by one stroke of the weapon, which was an unusually heavy one, roughly finished at a manufactory in New Orleans." Dr. Galloupe amputated the forearm near the wrist by the circular method, within ten minutes after the casualty occurred. The patient was then taken to New Berne, where he was placed in the hospital of his regiment. The entire wound healed by the first intention; no pus appeared, except in the track of the ligature, and complete recovery took place in eight days after the operation. Not a pensioner.

CASE 1846.—Private Corwin Davis, Co. I, 93d Indiana, stated, in his application for commutation for an artificial limb, that he was wounded at Gainesville, July 27, 1865, by a sabre cut in the left forearm. Two months after the reception of the injury his forearm was amputated five inches below the elbow by Surgeon Agnew, 6th Illinois Cavalry, at the regimental hospital. The stump is sound. This soldier was discharged November 10, 1865, and pensioned.

The comparative rarity of the reception of severe sabre wounds in action in recent wars[1] invests these examples with interest. The sabre cuts implicating the soft parts only of the upper extremity are noticed on page 435 *ante*. It was impracticable to discriminate from the returns the proportion implicating respectively the arm and forearm.

SHOT WOUNDS OF THE FOREARM.—The facts of most importance found on the returns regarding shot wounds of the soft parts of the forearm and the varieties of operative interference called for by such injuries, have been detailed at page 438 *et seq.*, in the 1st Section of this Chapter. Before discussing the shot fractures of the forearm, some examples of contusion and incomplete fracture will be noticed.

CONTUSIONS AND PARTIAL FRACTURES.—Ten cases of shot contusion, and thirty-two of partial fracture of one or both of the bones of the forearm, are reported.

§ *Shot Contusions of the Radius and Ulna.*—The ten cases of shot contusions of bones of the forearm were all of the second class, *i. e.* attended by penetrating wounds. One, followed by excision at the elbow (CASE 1819), is detailed on page 886; another (CASE 1410), treated by intermediary amputation unsuccessfully, is narrated on page 472. Eight are briefly noted here:

CASE 1847.—Private Mathias Weiser, Co. C, 6th Connecticut, aged 33 years, was wounded at Fort Wagner, July 18, 1863, and was sent from Morris Island to Hospital No. 1, at Beaufort, July 19, 1863. Assistant Surgeon C. E. Goddard, U. S. A., reported that the "patient was wounded by a musket ball in the upper third of the left forearm; the ball was removed October 25, 1863. There was some necrosis and exfoliation from the radius." This soldier was furloughed February 7, 1864, and discharged from the service, at Knight Hospital, New Haven, September 7, 1864. Not a pensioner. The ball (FIG. 663), a conoidal bullet, is split from the apex into the body, with the halves separated and rounded and the base somewhat roughened. It was sent to the Museum by Dr. Goddard, and weighs 515 grains Troy.

FIG. 663.—Bullet split on radius.—*Spec.* 4569. 1-1

CASE 1848.—Second Lieutenant Michael Houser, Co. C, 57th Pennsylvania, was wounded at Gettysburg, July 3, 1863. He was sent to Philadelphia, and admitted to the Officers' Hospital July 5, 1863, where Acting Assistant Surgeon Wm. Camac noted a "shot wound of the right forearm; a minié ball struck outer edge of radius about three inches from its upper extremity, passed obliquely across and outward, and made its exit about three inches below; bone not much injured, no bad symptoms, and on August 17th the wound had nearly healed." The patient was returned to duty September 3, 1863.

[1] BECK (B.) (*Kriegschir. Erfahr. während des Feldzuges*, 1866, S. 289) observed a case of nearly complete division of the ulna by a sabre cut. The injury of the bone was very severe, and, aside from periostitis, extensive cellulitis with pus formation supervened, necessitating incisions. After several fragments had exfoliated, recovery took place at the end of ten weeks without impairment of usefulness of the limb.

Professor Nott, of Mobile, has published an interesting case of shot contusion of the ulna,[1] remarking that his experience leads him "to believe that contusion is often quite as bad or worse than gunshot fracture."

CASE 1849.—Private D. C. Thatcher, Co. I, 12th New York, was wounded at Fredericksburg, December 13, 1862, and was admitted to Lincoln Hospital, Washington, December 26, 1862. Surgeon Henry Bryant, U. S. A., noted "*vulnus sclopetarium* of left forearm, the ball grazing the bone." This soldier was returned to duty May 7, 1863. Not a pensioner.

CASE 1850.—Private *John Cook*, Co. A, 37th North Carolina, received a gunshot wound of the right forearm at Ream's Station. The radius was partially fractured and the posterior interosseous nerve injured; extensive sloughing of the muscles of the back part of the forearm and slight exfoliation of bone ensued. The patient was retired February 8, 1865.

CASE 1851.—Private John T. McCartney, Co. E, 14th Pennsylvania Cavalry, aged 22 years, was wounded at Winchester September 19, 1864, and was sent to the Cavalry Corps Hospital, at Winchester, the next day. Surgeon L. P. Wagner, 114th New York, noted: "Gunshot wound of right forearm, a minié ball contusing the ulna a few inches below the olecranon process. Patient's health good; swelling of the arm very severe, with tendency to œdema; improving rapidly." The patient was transferred to the hospital at Frederick City, December 14, 1864, where Assistant Surgeon Helsby, U. S. A., noted that the "patient was nearly well on admission." Returned to duty March 30, 1865, with "good use of arm, flexion and extension improving daily." Examiner J. A. McLane, of Morgantown, West Virginia, certified, April 24, 1866, that the elbow joint was "nearly completely anchylosed and the arm somewhat atrophied." The Wheeling Board reported, September 6, 1872: "Complete anchylosis of elbow joint, and inability to bring the hand to the head or face; arm atrophied." Examiner L. L. Comstock, of Charleston, West Virginia, certified, April 7, 1875, that the "joint is anchylosed at an angle of forty degrees." This pensioner was paid September 4, 1875.

CASE 1852.—Private Allan M. Blanchard, Co. D, 12th Ohio, was wounded at Corinth, October 4, 1862, and discharged May 23, 1863, on account of necrosis. In January, 1867, he was examined, for re-enlistment in the army, by Acting Assistant Surgeon E. M. Powers, who reported a "gunshot wound of the left forearm, injuring the radius and necrosis of the radius, which continued to discharge until five months ago, since which time there has been no discharge; soft parts still red and puckered." This man is a pensioner, but the papers in the case were in use when application was made for information.

CASE 1853.—Private George M. Jacob, Co. D, 8th Maryland, aged 39 years, was wounded at Spottsylvania, May 8, 1864, by a conical ball. He was admitted to the hospital at Fairfax Seminary, May 12, 1864, where Acting Assistant Surgeon H. Allen noted: "Gunshot wound of right wrist, grazing bones of forearm." The patient was furloughed June 17, 1864, and discharged the service, on certificate of disability, July 13, 1864. On January 8, 1866, examiner Thomas Owings, of Baltimore, certified that the "ball fractured the radius near the wrist joint; a considerable portion of bone was lost. The wound has now closed, but several sharp spiculæ of bone are embedded in the callus, their ends protruding in such a way as to interfere with the proper action of the muscles; the right hand is consequently almost useless." This pensioner was paid September 4, 1875.

FIG. 664.—Osteitis from shot contusion of the ulna. *Spec.* 2017. 1/4

CASE 1854.—Private Charles McFadden, Co. B, 40th Ohio, was wounded at Lookout Mountain, November 24, 1863, and was sent from the field hospital, 1st division, Fourth Corps, to the hospital at Tullahoma, November 30, 1863, where Surgeon Benjamin Woodward, 22d Illinois, furnished the following history, viz: "Gunshot flesh wound through left forearm; the wound did well in all respects till the 15th of December, when from some unknown cause it suddenly took on unhealthy action and the arm swelled badly; lead lotion prescribed. December 20th, to this time there has been evidence of periosteal inflammation, elbow joint involved; rigors; high fever; whole arm œdematous; laid open arm in three places, giving exit to large quantities of sanious serum. 24th, pulse 140, small; tongue dry; bronchial respiration; moist rales; evident signs of pneumonia of both lungs. 25th, evidences of pyæmia prominent; put on stimulants, iron and quinine. 26th, arm to shoulder greatly swollen; inflammation extending over shoulder; arm laid open above elbow; no pus, but great quantities of sanious serum. 27th, breathing diaphragmatic; brain oppressed; pus in sputa. Died this P. M. Autopsy twenty hours after death; present, Surgeon W. C. Bennett, U. S. V., and Assistant Surgeon H. Pierce, 150th New York: From the putrid condition of the body no examination was made excepting the thorax; heart normal; twelve ounces of straw-colored fluid in the pericardium; emboli in ventricles, pulmonary artery, and innominata; fibrinous concretions adherent to the columnæ carneæ; lungs full of small abscesses; all of the bronchi contained pus; blood in cava descendens, under the microscope, showed very numerous oil globules; mucous coat of all the large bronchi injected and inflamed; arm removed four inches below the head of humerus, pus flowed from upper part; removed head of bone, glenoid cavity full of pus. *Dissection of bone:* Head of humerus showed in some parts destruction of articular cartilage, as did the edges of glenoid cavity; periosteum of ulna all gone; the greater part of radial periosteum dissected up by pus; all the ligaments and cartilage of elbow destroyed, also all the attachments of muscles. A well-marked prominent case of pyæmia." The specimen was sent to the Museum by Surgeon B. Woodward, and is described (*Cat. Surg. Sect.*, 1866, p. 151) as the bones of the left forearm, showing a necrosed condition of the middle third of the radius and erosion of the articular surfaces of the elbow, after pyæmia, following a flesh wound (and probably contusion of the ulna) of the forearm; it is copied in the annexed wood-cut (FIG. 664).

[1] NOTT (J. C.) (*Contributions to Bone and Nerve Surgery*, 1866, p. 65): Case of General Gracie, wounded at Bean's Station, Tennessee, afterward killed at Petersburg. A musket ball struck the forearm posteriorly two inches below the elbow, grazed the ulna, passed deeply and transversely through the deep flexors, and came out in front of the radius. The field surgeon could detect no lesion of bone. Twenty days after the injury the limb was much swollen and the little and ring fingers were paralyzed; and Dr. NOTT inferred that there had been a contusion of bone and that suppuration and exfoliation were imminent. Abscesses formed, and, at the end of six weeks, two exfoliations were removed, and rapid recovery ensued.

§ *Partial Shot Fractures of the Bones of the Forearm.*—Thirty-two instances were reported in which the bones of the forearm were grooved or chipped, or partially fractured, by small projectiles. The injuries involved the ulna in twelve cases, the radius in fifteen, both bones in one; in four cases the precise seat of the lesion was not specified. The left forearm was implicated in twenty cases, the right in ten, and in two cases this point was not noticed. Twenty-eight cases, of which two resulted fatally, were treated by expectation; in four, amputation in the upper arm was resorted to, unsuccessfully in two instances.[1] Brief memoranda of three of the recoveries and of the two fatal cases, treated by expectation, are subjoined:

Cases 1855–1857.—1. Major H. J. Covell, 6th Colored Troops, wounded in the right forearm, at New Market Heights, September 29, 1864, was sent to Fort Monroe, and thence to Seminary Hospital, Georgetown, and furloughed November 4th. On December 27th, he entered the Annapolis Hospital, and Hospital Surgeon B. A. Vanderkeift, U. S. V., reported: "The ball entered the posterior aspect of the middle third of the right forearm, passing between the ulna and radius, slightly fracturing the radius, and emerged opposite; the wound has healed, requiring no further treatment." Returned to duty January 2, 1865, and discharged April 25, 1865, and pensioned, Assistant Surgeon W. S. Codman, 107th Colored Troops, certifying that the wound produced "such adhesions of the muscles as to render the use of the arm and hand very imperfect." In September, 1873, Examiner W. M. Eames, of Ashtabula, certified that "the ball injured the ulnar nerve, so that the ring and little fingers are now numb, and the tendons of the thumb so adherent in the cicatrix that the power of grasping small objects is quite imperfect." This pensioner was paid September 4, 1875.——2. Pt. S. Ralph, Co. E, 13th New York, was wounded at Bull Run, August 29, 1862. On September 3d, he entered Filbert Street Hospital, Philadelphia, where Acting Assistant Surgeon R. J. Dunglison noted: "Gunshot wound of left forearm through the interosseous space; the ball passed through the posterior portion of the arm and emerged on the opposite side. The patient states that a small portion of bone was removed on the field, but there is nothing in the history or progress of the case to induce a belief that it was more than a mere splinter, without actual fracture. A compress has been placed in the interosseous space to prevent the accumulation of pus, and the forearm has been placed in a straight arm splint. October 1st, case progressing favorably." Transferred April 22, 1863, to Turner's Lane, and mustered out May 13, 1863. On September 30, 1863, he applied for a pension, but has not since been heard from at the Pension Office.——3. Pt. P. Ginglesperger, Co. H, 54th Pennsylvania, was wounded at New Market Heights, May 15, 1864, and sent to the hospital at Cumberland on May 18th. Acting Assistant Surgeon I. D. Skilling noted: "Gunshot wound of the left forearm by a musket ball, which entered the ulnar side three inches above the wrist joint, and passed upward and outward to its exit five inches above, cutting a small sliver from the external border of ulna; fragments of bone came out by ulceration; the patient was treated with cold-water dressings and simple cerate; afterward with resin cerate and poultices; the wound healed favorably, and he was returned to duty, cured, July 13, 1864." This soldier was again wounded in the left wrist at Winchester, September 19, 1864. He was discharged from service on account of the latter wound, September 16, 1865, and pensioned, his claim being based entirely upon the wound of September 19th; that of May 15th seems, however, to be alluded to by Examiner J. Lowman, of Johnstown, who certifies, November 20, 1866, that "one ball entered the left arm posteriorly, disabling the extensor muscles slightly; another ball entered the same arm anteriorly, one inch above the wrist joint, severing the muscles and nerves and leaving all the fingers crippled." Pensioner was paid September 4, 1875.

Pyæmia and tetanus, respectively, were the causes of death in the two fatal cases:

Cases 1858–1859.—1. Pt. J. Fuller, Co. H, 7th Illinois Cavalry, aged 24 years, was wounded, in General Forrest's raid on Memphis, August 21, 1864, and sent to Gayoso Hospital, from a provisional hospital at Fort Pickering, on August 23d. Surgeon F. Noel Burke, U. S. V., reported: "Gunshot wound of left forearm by a conical ball; partial fracture of the ulna. Gangrene appeared September 9th, and was cured by bromine. On October 4th pyæmia developed, and resulted fatally October 11, 1864. About seven days before death the patient took, twice daily, violent paroxysms very much like those of intermittent fever, which were broken by quinine and arsenic. At the time of his death the wounds were nearly healed. *Post-mortem* appearances: Metastatic abscesses in apex of left lung, and in liver, of the size of a hen's egg each; pus remarkably cream-like; spleen three times the ordinary size; a large and firm thrombus in right ventricle."——2. Pt. L. Connerty, Co. B, 203d Pennsylvania, aged 18 years, was wounded at Fort Fisher, January 15, 1865, and was sent from a Twenty-fourth Corps field hospital to Hampton Hospital, Fort Monroe, where Assistant Surgeon Ely McClellan, U. S. A., noted: "Admitted June 19, 1865; gunshot wound of left forearm, middle third, with partial fracture of ulna, by a minié ball; simple dressings." The patient died January 23, 1865, of traumatic tetanus.

Two of the ten cases of contusion, and four of the thirty-two cases of partial fracture, resulted fatally; which seems to show that these lesions, when situated in the ulna and radius, have far less gravity than when they affect the humerus or femur.

Shot Fractures of the Forearm.—The details and results of over five thousand shot fractures of one or both of the bones of the forearm have been satisfactorily ascertained.

[1] As follows: Case of Private Sullivan (Table LXXXVIII. No. 36, p. 790, *Spec.* 3329); Case of Corporal J. Dixon (Table XLV, No. 35, p. 470, and Table LXXXVI. No. 40, p. 785, and *Am. Jour. Med. Sci.*, 1868, Vol. LV. p. 58); these two patients recovered and were pensioned. The two fatal cases are noted as: Private J. C. Thompson (Table LXXXIX, No. 22, p. 791, *Spec.* 3674); Private J. W. Dyas (Table LXXXIII, No. 6, p. 774).

The results as to fatality have been determined in 98.6 per cent. of the cases—in all but 78. The classification of cases according to their treatment by temporization, excision, or amputation, is also very complete, and the ratio of results under the different methods of treatment are the more valuable since there are so few undetermined instances.

TABLE CXXIV.

Descriptive Numerical Statement of the Nature and Treatment of Five Thousand One Hundred and Ninety-four Shot Fractures of the Bones of the Forearm.

MODE OF TREATMENT.	CASES.	BONES OF FOREARM INJURED.																MORTALITY OF DETERMINED CASES.

Aggregates	.....	1,457				1,586				1,291				860				

It will be observed that of the forty-three hundred and thirty-four cases in which the seat of injury was precisely specified, the ulna alone was most frequently implicated; next the radius (in a third, within a near fraction, of the cases); and last in frequency were the cases in which both bones were involved.

SHOT FRACTURES OF THE FOREARM TREATED BY EXPECTATION.—Nearly three-fifths of all the reported cases were treated without operative interference. The average result was satisfactory, but one hundred and ninety-one deaths occurring in twenty-nine hundred and forty-three determined cases,—a mortality rate of 6.4 per cent.

1. FRACTURES INVOLVING BOTH BONES OF THE FOREARM.—The ulna and radius were both interested in twelve hundred and ninety-one instances, or less than a third of the forty-three hundred and thirty-four cases in which the precise seat of injury was specified. As might be inferred *a priori*, this group includes fewer examples of cases treated on the expectant plan than either of the series of fractures involving a single bone, and comprises the large majority of cases treated by amputation.

§ *Recoveries under Expectant Treatment.*—Of three hundred and twenty-three cases of shot fractures of both bones of the forearm treated on the expectant plan, two hundred

and ninety-nine terminated favorably. One hundred and three of the patients returned to full or modified duty; one hundred and ninety-six were discharged.

CASE 1860.—Private B. Koehly, Co. K, 2d Missouri, aged 40 years, was wounded and captured at Chickamauga, September 20, 1863. On October 29th, he entered the First Division Hospital, Annapolis, whence Acting Assistant Surgeon E. C. Malloch reported: "This man was taken prisoner when wounded and carried to Richmond, where he remained three weeks, and was then exchanged and brought to this hospital. He was wounded by a bullet passing through the middle of the right forearm, fracturing the ulna. At the time of admission his general health was good and the wound was perfectly healthy—the wound of entrance quite small, but that of exit very large, with ragged edges. Water dressings were applied to the wound, and the arm was kept in position by means of a splint to the anterior surface of the forearm. November 5th, doing well; six small pieces of bone have come away since he was wounded. 10th, wound looks healthy; patient complains of no pain. 30th, up to this date not an unfavorable symptom has appeared. December 19th, two small pieces of bone could be seen and were easily removed by forceps. 20th, removed another piece of bone and a small piece of lead. 21st, complains of pain in the arm and general uneasiness. 22d, wound does not look healthy; secretion of pus more abundant and rather fœtid. Ordered a mixture of solution of permanganate of potassa two ounces, and water five ounces, to be used locally. 23d, to-day the wound presents a decidedly sloughing appearance, the edges undermined and inflamed, and the whole surface covered with a superficial slough. General appearance of patient changed, face anxious, tongue slightly furred; no appetite; bowels costive; pulse more quick than usual. Ordered the patient to a separate ward, and the arm to be treated with poultices composed of yeast and charcoal, the former lotion being used only as a wash. Prescribed whiskey six ounces, and beef tea *ad libitum*. 24th, the wound, formerly two inches in diameter, has extended half an inch the last two days. 25th, unhealthy action still proceeds; extension of slough quite visible. Complains of very severe pain in arm, which was alleviated by the local application of solution of morphia one grain to an ounce of water. Is unable to sleep, and takes one-third of a grain of morphia at bed-time. The poultices, &c., were continued as before. 26th, general condition unchanged; the wound measures three inches long and two and a half wide. Last night had a slight hæmorrhage, when a slight local application of solution of persulphate of iron was used. Bowels still being costive, three compound cathartic pills were given. 27th, no change; cannot sleep at night. Ordered the following draught at bed-time: Sulphate of morphia half a grain, chloroform eight drops, spirits one ounce, simple syrup four drachms, and water an ounce and a half. 29th, condition as formerly; slept well last night; bowels regular; local applications continued. 31st, appearance unchanged; boundary line of wound several lines more in extent. January 5th, a very perceptible change has taken place; the sloughing process has entirely stopped, except at the upper angle. Ordered the poultices to be discontinued and the parts washed twice daily with alcohol. The wound now measures four inches and a half in its largest diameter, three inches wide, and one and a half inches deep. The extremity of the lower fragment of the broken bone is visible. 8th, feels very much improved; the whole wound appears healthy; complains of very little pain except during dressing; appetite very much improved; can rest well at night. At this date the case, by order of the surgeon in charge, was placed under treatment of Acting Assistant Surgeon H. Loewenthal." On April 9th, the patient was returned to duty at Camp Parole. Subsequently he rejoined his regiment in the field, whence he was discharged July 18, 1864. Examiner E. A. Clark, of St. Louis, February 12, 1867, certified: "Gunshot wound in right arm, fracturing the radius and ulna at their middle. The fracture has united, but the union has taken place conjointly between the two bones, preventing the movements of pronation and supination of the forearm. The ulna at the point of fracture is still in a state of necrosis. There has also been extensive sloughing of the soft parts, so that the extensor tendons of the forearm have become so contracted as to prevent flexion of the fingers," etc. The St. Louis Board reported, September 16, 1873: "There is now atrophy of the forearm, deformity, and almost total loss of grasping power." The pensioner was paid September 4, 1875.

CASE 1861.—Corporal A. Burlingame, Co. D, 64th New York, aged 22 years, was wounded at Fair Oaks, June 1, 1862. Surgeon G. W. Barr, of the regiment, recorded: "Gunshot wound of arm." On June 6th, the wounded man entered Wood Street Hospital, Philadelphia, whence Acting Assistant Surgeon C. B. Voight reported: "He had been wounded in the left forearm by an explosive missile of the size of a musket or rifle ball. It penetrated the limb at the middle, on its front surface, and detonated within with the collision against the ulna. Four or five inches of this bone was blown away by the explosion of the embedded projectile in part, or was subsequently detached and removed in fragments of various sizes. The muscular and other soft textures on the front of the arm participated in the disruption and dissipation of substance and structure. The radius was denuded to some degree but escaped without fracture. The wound also opened freely on the back of the arm. There was, of course, considerable loss of substance. Profuse suppuration kept up for six weeks continuously, but gradually abated, and under careful bandaging, and dressing of charpie imbued with simple cerate in the interior of the wound, with tonics to sustain the powers of the system, the patient was discharged at the end of two months in good general health, the excavation being more than one-half diminished and filled in with healthy florid granulations, promising obliteration within further reasonable space of time. He was a person of muscular and full-sized frame." The patient was discharged, at his own request, July 29, 1862, and pensioned. Examiner F. Findlay, of Franklinville, New York, March 23, 1874, certifies: "A scar about four and a half inches long occupies the middle of the back of the left forearm and indicates the entrance of the ball. It emerged in front of the ulna. It grazed the radius and broke the ulna in its middle third. The upper fragment overlaps the lower; the lower is consolidated with the radius. The entire arm is atrophied; flexion and extension abridged at the elbow; pronation and supination entirely destroyed; the skin is adherent to the back and middle of radius and ulna, the muscles being destroyed; flexion and extension of fingers very imperfect or irregular," etc. This pensioner was paid September 4, 1875.

In the two foregoing instances (in which splinters were removed), and in most cases of fracture of both bones with much comminution, union resulted with various degrees of deformity, and usually with serious impairment of the rotatory movements of the forearm,

especially of supination. Permanent pseudarthrosis was reported in but two of the three hundred and twenty-three cases,[1]—in the radius in one case, in both bones in one:

CASE 1862.—Private W. E. Bunting, Co. C, 68th Pennsylvania, aged 19 years, was wounded at Gettysburg, July 2, 1863, and admitted to the field hospital of the 1st division, Third Corps, where Surgeon J. W. Lyman, 57th Pennsylvania, recorded: "Compound comminuted fracture of right forearm by conoidal ball; simple dressings applied." On July 9th, the wounded man entered Satterlee Hospital, Philadelphia, whence Acting Assistant Surgeon J. H. Hutchinson reported: "Gunshot wound of right forearm. Both bones appear to have been fractured, but were united with some deformity at the time of his admission into my ward, on September 17th. While under treatment in one of the other wards, it was at one time doubtful whether it would be possible to save the arm. There is slight caries of the ulna, but it is not considered advisable to interfere. General health excellent. October 1st, no change. November 10th, arm continues in very much the same condition. November 23d, all the motions of the hand are preserved, while those of the forearm are gone. December 8th, doing well. 31st, patient transferred to the Veteran Reserve Corps." He was discharged from service, October 20, 1864, by reason of "permanent anchylosis of elbow joint following the wound." Examiner T. B. Reed, of Philadelphia, September 22, 1865, certified: " * * Caries and discharge. Use and power of arm much impaired." The Philadelphia Board, consisting of Drs. T. H. Sherwood, J. Collins, and H. E. Goodman, September 24, 1873, certified: " * * Arm and forearm atrophied. Now healed, but breaks out." At a subsequent examination, May 20, 1874, they reported: "Some deformity in ulna, it being bent outward. There is no appreciable shortening. Cicatrices adherent and tender; motion of hand and fingers good." The pensioner was paid September 4, 1875.

CASE 1863.—Private M. Harrington, Co. K, 5th Cavalry, aged 20 years, was shot by a guard while trying to escape from the guard-house in camp at Washington, November 17, 1865. On the following day he was admitted to Harewood Hospital, whence Surgeon R. B. Bontecou, U. S. V., reported: "Compound comminuted gunshot fracture of radius and ulna, a minié ball entering externally, about the junction of middle and lower thirds, passing through in an upward direction, and emerging on inner side, at middle third. Numerous pieces of bone were removed at different times, and on December 2d one-half of the ball was taken away. The treatment was supporting and the wound did well. Patient transferred to post hospital May 1, 1866." Assistant Surgeon W. Thomson, U. S. A., reported the soldier's admission to the latter hospital with "gunshot fracture of both bones of left forearm," and his return to his company for duty August 6, 1866. This man is not a pensioner.

§ *Fatal Cases of Shot Fracture of the Ulna and Radius.*—Twenty-four, or 7.4 per cent. of the whole number of cases reported, resulted fatally. The following is an example:[2]

CASE 1864.—Private D. O'Leary, Co. K, 15th New Jersey, aged 29 years, was wounded at Chancellorsville, May 3, 1863. Five days afterward he was admitted to Douglas Hospital, Washington, where he was attended by Assistant Surgeon C. C. Lee, U. S. A., who made the following report of the case: "A conoidal ball entered the middle third of the right forearm, comminuted the radius and ulna, and, passing up the arm to the elbow, was arrested at the bifurcation of the brachial artery, upon which it was found lying when admitted to this hospital. The patient was in a state of collapse, with dry tongue and fluttering pulse; the right arm was immensely swollen, and from the elbow to the chest was of a dark-red mottled color, somewhat resembling diffused erysipelas; the hand and lower third of the forearm were cold, puffy, and œdematous, but not discolored to the same extent. No pulse was perceptible at the wrist. A wineglass of brandy, with small quantities of morphia, was given every three hours. On the day after his admission, the erysipelatous redness had spread from the arm to the chest and down the right side as far as the ilium; and on the anterior surface of both thighs, along the lines of the lymphatics, a similar discoloration was observed. It also began to assume a darker color, more closely resembling the eruption of scurvy than the light-red hue of erysipelas. A wineglass of milk-punch and of beef essence was administered on this day every alternate hour. May 10th, eggnog was substituted for the milk-punch. The patient, in spite of all the stimulants he could take, was beginning to sink. In addition to his prostration, singultus and vomiting came on, for which two drops of creasote was given in emulsion every hour. He sank exhausted, on May 11th, the third day after entering the hospital. He had no fever from the first, and complained of very little pain when the arm or chest was handled. At an autopsy, made ten hours after death, the bones of the forearm were found extensively comminuted, as already stated, and the bullet, which was much bent and distorted, was compressing the bifurcation of the brachial artery and the accompanying veins. This pressure was undoubtedly the cause of the œdematous and semi-gangrenous condition of the hand, but it offered no clue to the remarkable change of color of the skin. The latter was mainly due to extravasated blood in the subcutaneous tissue, which was tough and brawny; no phlebitis could be detected, and all the viscera were sound." Assistant Surgeon W. Thomson, U. S. A., in charge of the hospital, who contributed the specimen (FIG. 665), remarked, in addition to the above: "There was no evidence of pyæmia or phlebitis, and indeed nothing to account for the singular and very extensive discoloration of the skin. The most remarkable fact was this livid hue of so great an extent of the surface, not erysipelatous, entirely unaffected by pressure and hence petechial in its character, and resembling an effusion into or beneath the skin of the coloring matter of the blood." The specimen consists of the upper half of the right ulna and superior extremity of the radius, and the lowest third of the humerus, with the battered ball lodging in the ulna just below the coronoid process. The ulna presents a longitudinal fracture extending along the entire length of the specimen.

FIG. 665.—Ulna and radius comminuted by a conical ball. *Spec.* 1252.

[1] Cases of PE. H. KAUBER, Co. L, 5th Pennsylvania Cavalry, and PE. J. N. BEESUP, Co. B, 114th Illinois, both with shot fractures of the right ulna and radius, and reported by Drs. G. MCCOOK and B. A. VANDERKIEFT, the first with pseudarthrosis of the radius, the last with non-union of both bones.

[2] Two other examples of the appearances after shot fracture of both bones of the forearm are shown in FIG. 628, on p. 872, and FIG. 635, on p. 881.

2. FRACTURES OF THE ULNA TREATED BY EXPECTATION.—The results of a thousand and forty-four cases of shot fracture of the shaft of the ulna, treated on the expectant plan, were determined, except in five cases. There were fifty-nine deaths, a mortality rate of 5.6 per cent.

§ *Successful Cases.*—Some instances will be detailed from the series of nine hundred and eighty recoveries from this injury. Four hundred and ninety of the patients were returned to modified duty, and four hundred and ninety were discharged.

CASE 1865.—Private A. E. Wilcox, Co. K, 6th Connecticut, aged 31 years, was wounded at Pocotaligo, October 22, 1862. Two days afterward he was admitted to Hospital No. 1, Beaufort, where Surgeon R. B. Bontecou, U. S. V., noted as follows: "Gunshot wound of right forearm. The wound was inflicted by a portion of a shell, which passed across the outer aspect of the forearm three inches below the extremity of the olecranon, and fractured the ulna without comminution. Considerable tumefaction of the whole arm induced me to relieve the tension of the fascia by the knife, and lay the arm on a simple straight splint, applied to the palmar side, and an ice-bag over a thin poultice to the wound. November 15th, considerable discharge, and a rough portion of bone discovered by the sound. General health disturbed by chills, which, I think, are independent of the wound. Quinine, in ten-grain doses, stopped these. December 1st, patient walks about and requires little attention. Discharge from arm trifling. December 28th, the bone has become firmly united; he is carrying his arm in a sling without the splint, and will soon be able to go to his regiment. February 15th, sent to his company." On April 25th, this man was admitted to Hospital No. 2, Beaufort, whence he was discharged from service May 11, 1863, on account of "loss of use of right arm." Examiner H. Pierpont, of New Haven, August 4, 1863, certified: "Was wounded by a piece of shell in the right arm, about three inches below the elbow joint, crushing the ulna. The bones are not yet firmly united. The extensors of the fingers and hand are contracted so as to prevent the shutting of it." Drs. G. C. Jarvis and H. S. Fuller, of the Hartford Examining Board, certified, September 8, 1873: "* * * No motion of the forearm. The hand can only be partly closed on account of adhesion of muscles and skin to the bones." The pensioner was paid June 4, 1875.

The utility of free incisions to relieve the strangulations from inflammatory engorgement or intermuscular extravasation, so common in seton wounds of the forearm, is well exemplified in this case, a sound practice derided by many misinterpreters of John Hunter.

CASE 1866.—Sergeant P. Hogan, Co. L, 3d U. S. Artillery, was wounded at the battle of Gaines's Mill, June 27, 1862, and sent to one of the hospital transport steamers on James River. He was admitted to the Union Chapel Hospital, Washington, July 7, 1862, where Acting Assistant Surgeon W. H. Butler recorded: "Gunshot wound of left arm. Patient transferred to Douglas Hospital July 28th." Assistant Surgeon W. Webster, U. S. A., in charge of the hospital, contributed the specimen (FIG. 666), and reported that the patient was discharged from service November 13, 1862, by reason of "gunshot wound." The specimen is described in the *Catalogue of the Surgical Section*, 1866, p. 601, as "a flattened, distorted round ball perforated by a fragment of bone from the forearm, which it embraces, necrosed." It is a curious specimen, in which the metal, softened by impact, has embraced and carried off what appears to be a fragment of the upper part of the shaft of the ulna, seven-eighths of an inch in length and three-eighths in thickness. The ball, with the enclosed bone fragment, weighs three hundred and seventy grains Troy. This man was a pensioner. He died November 19, 1873. The papers in the case which might afford additional particulars were in use at the Pension Office and could not be consulted.

FIG. 666.—A distorted ball enveloping a fragment of the ulna. *Spec.* 4182.

CASE 1867.—Corporal H. W. Hurd, Co. B, 7th New Hampshire, aged 29 years, was wounded at Fort Wagner, July 18, 1863. On the following day he was admitted to Hospital No. 4, Beaufort, where Assistant Surgeon J. Trenor, jr., U. S. V., recorded: "A minié ball entered the right forearm just outside the radial artery and half an inch from wrist joint, passed upward, fracturing the ulna at the junction of the middle with the upper third, and passed out two and a half inches below the elbow joint posteriorly. The point of exit was marked by a protuberance the size and shape of half a hen's egg, and composed of a muscular mass. The shock to the nervous system was great; pulse feeble; surface natural; sensation and circulation perfect in hand and over surface; a good deal of tumefaction. Patient complains of pain, and has not slept since the reception of the wound. Applied cold-water dressings. The radius acts as a splint to the ulna. July 20th, passed a poor night; arm less hot but painful; discharge increasing, rather too fluid in character, and inclined to be sanious. Continued the dressings, and gave one ounce of spiritus frumenti. July 21st, passed a better night, and slept well for three hours; arm little if at all painful when kept quiet; discharge pretty free; pulse 88, strong and natural; bowels have moved, and patient feels comfortable every way. Continued dressings, and gave one ounce of spiritus frumenti three times a day. July 22d, slept well; appetite still fickle; arm much cooler and less swollen. Continued treatment. July 23d, passed a good night; skin natural; arm comfortable; pulse 86; appetite improving; everything going on well. July 31st, inflammation has mostly subsided; patient doing extremely well. August 1st, a long strip of linen appeared at the lower opening and was removed; the protuberant mass at the upper opening decreasing in size." The patient was subsequently transferred to Lovell Hospital, Portsmouth Grove, R. I., where he was discharged from service December 30, 1863, by reason of "gunshot fracture, etc., with entire loss of motion of right hand." Examiner B. S. Warren, of Concord, N. H., January 19, 1864, certified: "A ball struck the front of his right wrist over the lower extremity of the radius, and, passing upward and backward, issued from the back of the forearm about two and a half inches below the olecranon, fracturing the ulna and injuring the ulnar and radial nerves, thereby paralyzing the hand, which is purplish, the fingers being flexed, and he having no power to extend them. He can make only partial rotation of the forearm." Other examiners report substantially the same at subsequent dates. The pensioner was paid September 1, 1875.

It is deemed an unprofitable task to attempt to determine the proportion of cases in which the shot fractures of the ulna and of the radius treated by expectation interested the right or left extremity; partly because the number of instances in which this point is unspecified in the records is so great that the approximate result would be almost worthless, and partly because the facts respecting the fractures of the forearm thus treated are gleaned from such a large variety of returns that the labor of reviewing them would be inordinate for the object in view, and indeed impracticable with the limited time and clerical assistance at my disposal.

Eighteen of the cases of recovery from shot fracture of the ulna treated by expectation were complicated by consecutive hæmorrhage. In three of the cases, recourse was had to ligation of the brachial on the method of Anel:[1]

Case 1858.—Corporal A. D. May, Co. H, 33d Indiana, aged 22 years, was wounded at Resacca, May 15, 1864. He was admitted to the field hospital of the 3d division, Twentieth Corps, where Surgeon W. Grinsted, U. S. V., recorded: "Gunshot compound fracture of right forearm; fragments removed by Assistant Surgeon J. S. McPheeters, 25th Indiana." On May 21st, the wounded man entered the General Field Hospital at Bridgeport, whence Assistant Surgeon H. T. Legler, U. S. V., reported as follows: "Wounded in right forearm by a musket ball, fracturing the ulna in the middle extensively. Hæmorrhage occurred on May 24th, 25th, 26th, and 27th from the ulnar or interosseous artery; patient anæmic in consequence of the loss of blood—amounting to thirty-four ounces; wound looking well and suppurating. On May 27th, ligation of the brachial artery in its continuity was performed at the elbow by the reporter. Chloroform was the anæsthetic used, and the patient reacted promptly. The treatment consisted of water dressings, stimulants, and nourishing diet. The new circulation was well established on the third day after the operation; the ligature came off on the eleventh day. Patient furloughed August 27th." At the expiration of his furlough the patient reported at Indianapolis, where he was discharged from service March 17, 1865, and pensioned. Examiner G. W. Mears certified, April 4, 1865: "Ball entered on inner side of middle third of forearm, and ranging outwardly, fracturing in its course the ulna badly, escaped on outside, a little lower down. The wound is not quite healed; the rotary motion of arm uninjured, as is also the motion of hand and wrist, but all the fingers are somewhat stiff, considerably impairing their usefulness." A Board, consisting of Drs. Newcomer, Mears, and J. K. Bigelow, certified, September 10, 1873, that "the injury has left the forearm distorted, and with adhesive and tender cicatrices." The pensioner was paid September 4, 1875.

Five of the eighteen cases of secondary hæmorrhage were successfully treated by tying the ulnar artery.[2] In three instances, at least, distal and proximal ligatures were applied at the seat of the injury:

Case 1869.—Private W. H. Harrison, Co. M, 1st Artillery, aged 22 years, was wounded at Olustee, February 20, 1864, and admitted to Hospital No. 2, Beaufort, three days afterward. Surgeon C. L. Allen, U. S. V., reported: "Gunshot fracture of left ulna. Ball entered on the outside of the forearm three inches above the wrist, and made its exit on the inside, four inches above the wrist. Ulna fractured without much comminution. March 1st, hæmorrhage occurred from the distal extremity of the ulnar artery to the amount of about forty ounces. The wound was enlarged above and below, and, upon a director, the artery was ligated both above and below the seat of injury, by the reporter. Chloroform was safely employed. The patient had been attacked with diarrhœa from the moment of receiving the wound; bowels regular before. The diarrhœa was not easily checked by remedies, and had passed into dysentery a few days before the hæmorrhage occurred. Simple dressings were used. The wound granulated quickly; the upper ligature came away March 8th, the lower one on the 10th. By March 31st, callus was distinct around the fractured point; patient doing well. Result: recovery." The patient was furloughed April 13th, readmitted to hospital during the following month, and returned to his command for duty July 12, 1864. He is not a pensioner.

Four of the eighteen cases of consecutive hæmorrhage associated with fracture of the ulna were treated by ligation of the radial.[3]

[1] Besides the instance detailed in the text, there can be studied, in the manuscript records: 1. The case of G. L. B. McMillan, Co. C, 40th Ohio, aged 21 years, shot fracture of right ulna, Chickamauga, December 20, 1863; gangrene, hæmorrhage, ligation of brachial; recovery. 2. The case of W. Henderson, Co. E, 115th Pennsylvania, left ulna comminuted in lower third, Gettysburg, July 2, 1863; sent to Cuyler Hospital, Germantown—sloughing; August 8th, incontrolable hæmorrhage from ulnar artery, ligation of brachial by Dr. J. Ashhurst, jr.; recovery.

[2] Besides the detailed case of Harrison were: 1. Case of Pt. M. Ford, Co. G, 51st New York, left ulna fractured, Antietam, September 17, 1862; hæmorrhage, ulna ligated at both ends, at Newark, October 2, 1862; recovery. 2. Pt. L. H. Price, Co. G, 86th New York, ulna fractured, Manassas, August 30, 1862; September 15th, ligation; recovery. 3. Lieut. J. B. Kripps, Co. E, 2d Pennsylvania Artillery, left ulna fractured, Chapin's Farm, September 29, 1864; October 8th, hæmorrhage, ligation of ulnar artery, both ends tied. 4. Pt. W. H. Fox, Co. F, 15th Wisconsin, aged 18 years, left ulna fractured, Atlanta, August 20, 1864; consecutive hæmorrhage, ligation, recovery, by Dr. Hill.

[3] 1. Pt. O. Donnell, Co. C, 3d Pennsylvania Artillery, aged 20 years, left ulna fractured, Gettysburg, July 3, 1863; hæmorrhage July 21st, ligation of proximal end of radial; slight recurrent hæmorrhage from distal end; recovery. 2. Pt. G. M. Rose, Co. G, 6th Cavalry, ulna fractured, Bealton's Station, March 9, 1864; hæmorrhage April 7th, proximate end of artery ligated in wound by Acting Assistant Surgeon D. P. Wolhaupter; duty July 12, 1864. 3. Pt. P. Vankirk, Co. A, 26th Pennsylvania, left ulna fractured, Gettysburg, July 2, 1863; July 22d, hæmorrhage from radial, one end of artery tied in wound; duty May 3, 1864. 4. Pt. C. Lamper, Co. F, 82d Pennsylvania, aged 21 years, left ulna fractured, Cold Harbor, June 1, 1864, sloughing, hæmorrhage; July 27th, radial ligated in wound by Acting Assistant Surgeon W. F. Atlee; discharged May 17, 1865.

§ *Fatal Cases.*—Fifty-nine, or 5.6 per cent. of the thousand and thirty-nine determined cases of shot fracture of the ulna, treated by expectation, belong to this subdivision. Pyæmia and gangrene were the principal fatal complications.

Case 1870.—Private H. A. Fellows, Co. C, 12th New Hampshire, aged 18 years, was wounded at Gettysburg, July 3, 1863, and admitted to Satterlee Hospital two days afterward. Surgeon I. I. Hayes, U. S. V., recorded: "Wound of right forearm. July 6th, erysipelas. 7th, the arm is very much swollen and red. It is possible that there is a fracture of one of the bones of the forearm, but in its present condition it is impossible to discover it. Gave twenty drops of tincture of chloride of iron every three hours, and applied mucilage to the arm, which is simply laid upon a pillow; low diet. 8th, is very much better; the erysipelas appears to have been arrested by tincture of iodine. 9th, improving; low diet continued. 10th, on examination to-day, it appears that the ulna is decidedly broken. 11th to 20th, patient doing well; low diet continued; cold-water dressings used. He died, of exhaustion from hæmorrhage and diarrhœa, on August 20, 1863." Acting Assistant Surgeon J. Leidy, who contributed the specimen (Fig. 667), made the following report of the *post-mortem* examination: "Body vigorous in appearance, but exceedingly pale, apparently the result of frequent hæmorrhage. The wound was extremely gangrenous and its course filled with a large recent coagulum of blood from hæmorrhage. Organs of chest healthy. Spleen full size, curiously mottled; in section pale, comparatively bloodless, and occupied by a great multitude, apparently, of malpighian bodies. Mucous membrane of the small intestines, more especially the ileum, moderately inflamed; the solitary glands large, white, and conspicuous; mucous membrane of the cæcum moderately inflamed. No disease of the brain existed, but like all the organs it was exceedingly pale and bloodless." The specimen shows the bones of the forearm, the middle third of the ulna having been shattered, with comminution and loss of substance for three inches. The lower extremity has a small deposit of callus, but the upper fragment is necrosed.

Fig. 667.—Bones of right forearm: ulna shattered at middle third. *Spec.* 1874.

Fig. 668.—Left ulna, obliquely fractured in lower third. *Spec.* 1876.

Case 1871.—Private N. Harris, Co. I, 24th Michigan, aged 23 years, was wounded at Gettysburg, July 3, 1863. Acting Assistant Surgeon A. L. Eakin reported his admission to Satterlee Hospital, Philadelphia, July 9th, and the progress and result of the case as follows: "Patient had a compound fracture of the right ulna, and also a like wound of the metacarpal bones of the left hand. Splints were applied to the right arm and flaxseed dressings to left hand. About July 23d, diarrhœa set in, which was somewhat checked during the following week. Cough came on also; a prescription of syrup of squills two and a half ounces, paregoric an ounce, and solution of sulphate of morphia half an ounce, was ordered in doses of a teaspoonful when needed, and tannic acid two grains, together with half a grain of pulverized opium, was administered four times daily. Beef tea and milk-punch were ordered, and cold-water dressing was applied to the hand. On the 24th, the fæces were passed involuntarily, and so continued for several days. There was also a slight hæmorrhage from the wound in the hand, checked by cold applications. From the 24th, though the diarrhœa was somewhat checked, he continued to fail, and about the 28th, pneumonia of the left lung, complicated with pleurisy, attacked him; prescribed tartar emetic one grain, calomel sixteen grains, and nitrate of potassa one and a half drachms, to be divided into sixteen powders, and administered one every three hours; also, sulphate of quinine two grains, and carbonate of ammonia one and a half grains, four times daily. During the attack of diarrhœa there was also an injection given of fifty drops of tincture opii three times a day. The patient died August 5, 1863." Acting Assistant Surgeon J. Leidy contributed the specimen, represented in the adjacent wood-cut (Fig. 668), and the following report of the *post-mortem* examination: "The parts in the track of the ball, extending some distance above and below, and including all the tissues, were gangrenous, black, semifluid, and putrid. The external wounds had not enlarged to any important degree from the gangrene. The wound of the hand was also in a similar gangrenous condition. Excepting recent pleuro-pneumonia of the lower lobe of the left lung, extending to the upper lobe, the organs of the chest and abdomen appeared healthy." The specimen consists of the left ulna, obliquely fractured in the lower third with some comminution, the extremities of the bone being necrosed.

3. SHOT FRACTURES OF THE RADIUS TREATED BY EXPECTATION.—Of a thousand and nine cases, the results are unascertained in ten. The proportion of deaths are slightly less than in the preceding group, the proportion of grave disabilities somewhat greater.

§ *Successful Cases.*—Of the nine hundred and forty-nine patients who recovered, four hundred and forty-five returned to modified duty, and five hundred and four were discharged.

Case 1872.—Private A. Clough, Co. C, 31st Maine, aged 18 years, was wounded at Cold Harbor, June 3, 1864, and admitted to the 2d division hospital, Ninth Corps, where Surgeon J. Harris, 7th Rhode Island, recorded: "Wound of right arm." On June 7th, the wounded man entered Harewood Hospital, Washington, whence Surgeon R. B. Bontecou, U. S. V., reported: "Compound fracture of right radius, lower third. Secondary hæmorrhage occurred on June 8th, to the amount of about twenty-four ounces; radial artery ligated above and below the wound. Hæmorrhage did not recur; patient doing well." On July 21st, he was transferred to DeCamp Hospital, New York, and subsequently to Cony Hospital, Augusta, where he was assigned to the Veteran Reserve Corps, February 18, 1865. The man was ultimately discharged from service August 30, 1865, and pensioned. Examiner J. G. Bell, of Augusta, Maine, May 25, 1866, certified: "Ball passed through the forearm five inches above the wrist, causing compound comminuted fracture of the radius, and removing a large part of diameter of the bone for a space of two inches in length. Muscles attached to bone; use of hand much impaired." The pensioner was paid March 4, 1867.

The foregoing and following cases were complicated by secondary hæmorrhage and successfully treated by ligation of the radial, and there were six others of the same description.[1] There were eighteen instances of secondary hæmorrhage; five treated by compression, eight by ligation of the radial, and five by ligation of the brachial.[2]

CASE 1873.—Captain H. S. Harding, Co. A, 122d Ohio, aged 42 years, was wounded at Cold Harbor, June 3, 1864, and admitted to the field hospital of the 2d division, Sixth Corps. Surgeon R. Barr, 67th Pennsylvania, noted: "Gunshot fracture of left radius by shell; ligation of radial artery." Surgeon A. F. Sheldon, U. S. V., reported the patient's admission to Campbell Hospital, Washington, June 11th, with "gunshot fracture of left forearm," and his departure "on furlough, August 30th." This officer was mustered out of service October 29, 1864, and pensioned. Examiner Hildreth, of Zanesville, April 30, 1865, certified: "The missile passed through the lower third of the forearm, fracturing both bones. The wound was followed by erysipelas, etc. His fingers are partially stiffened, but they are gradually improving," etc. The Zanesville Examining Board reported, September 5, 1873: "* * * The fracture of the radius was superficial, that of the ulna was complete; the flexor tendons wounded, also the internal cutaneous nerve. The skin is numb on the inner side of the forearm, and there is adhesion of tendons at seat of wound to skin and fascia. Hence he can only flex the fingers to one-half, the adhesions limiting the further flexion of them, and from this cause the power of the forearm and hand is impaired." The pensioner was paid Sept. 4, 1875.

Hospital gangrene, as illustrated in Plate XVI opposite, occurred occasionally in the cases of this group, but less frequently than in shot wounds on the ulnar side:

CASE 1874.—Private C. F. Keables, Co. C, 18th Connecticut, aged 24 years, was wounded at Winchester, June 14, 1863, and was taken prisoner. He is reported at Annapolis, August 3, 1863, from Richmond. Surgeon B. A. Vanderkeift, U. S. V., reported: "Gunshot wound of left forearm." Acting Assistant Surgeon C. Hayes reported: "Ball entered outer portion of left forearm at lower third, passing through and slightly fracturing the radius. When admitted was doing well. August 12th, outer wound commenced to slough; slight chill, followed by fever. 13th, slough increasing rapidly. 14th, wound still sloughing at lower side; along the upper edge it looks better. 15th, slough is separating from the upper side. 16th, slough is almost entirely separated; wound throwing off healthy granulations. 18th, wound is now clean and healthy; is about four inches long, three wide, and one quarter of an inch deep." This soldier was furloughed December 22, 1863; transferred to Veteran Reserve Corps May 8, 1864; discharged August 17, 1865, and pensioned. Examiner A. W. Nelson, of New London, Connecticut, April 2, 1867, reported: "Wound healed; cicatrix two inches above left wrist, back of forearm; cicatrix two and a half inches square adherent to radius; lost several pieces of bone before healing of wound—two pieces an inch long; minié ball came out at the inner and ulnar side of forearm five inches above the wrist; pronation of forearm perfect; supination somewhat impaired; wrist movement very slight; joint nearly anchylosed; fingers of the left hand can only be extended to an angle of 150 degrees; movements of thumb much impaired; cicatrix tender." A drawing of the wound in its gangrenous condition was made by Hospital Steward E. Stauch, and is shown in the chromo-lithograph, PLATE XVI.

Other complications were erysipelas and exfoliation of necrosed fragments:

CASE 1875.—Private C. Siboli, Co. C, 11th Massachusetts, aged 28 years, was wounded at the Wilderness, May 6, 1864. Surgeon A. O. Judson, U. S. V., reported his admission to Carver Hospital, Washington, May 26th, with "gunshot fracture of right radius," and his transfer to Philadelphia on May 31st. Acting Assistant Surgeon H. M. Bellows reported, from Broad and Cherry Streets Hospital: "This patient was first admitted to this hospital, June 1st, with a compound gunshot fracture of right radius by a bullet, which entered the upper third of the radial side of the forearm, and, passing posteriorly upward and slightly outward, came out on the upper posterior part of the forearm, about one inch below the external condyle of the humerus. July 10th, several pieces of bone have come away from the wound. August 25th, patient transferred to Turner's Lane Hospital." Acting Assistant Surgeon C. Carter, from the latter hospital, reported: "Forearm fixed in a pronated position; wrist and fingers extended, but not fully, with little power of motion; large amount of callus at seat of wound, with apparent deformity; orifice two inches below flexure of elbow, over upper part of radius, discharging pus; dead bone felt with probe. August 28th, active and passive movements resorted to. September 6th, removed dead bone, a piece the size of a small finger nail. November 1st, wound still discharging; has gained slight motion in fingers, wrist, and supination. Continued active and passive motion." The patient was discharged December 12, 1864, and pensioned. Examiner Howell, of Aurora, June 4, 1873, certified: "* * * Rotary motion is entirely destroyed; necrosis of radius at point of exit of ball; arm swollen and painful; muscles of forearm and hand weak and partially paralyzed; hand entirely useless for manual labor." On July 7, 1875, he again reported: "Constant discharge of ichorous purulent matter, with occasional spiculæ of bone. Supination and pronation destroyed; atrophy of muscles of forearm and hand, rendering forearm and hand totally useless," etc. The pensioner was paid June 4, 1875.

[1] Pt. J. M. Hall, Co. E, 20th Illinois, right radius, Shiloh, April 6, 1862, radial artery ligated; discharged August 6, 1862. Pt. A. Hakes, Co. A, 32d New York, right radius, Antietam, September 17, 1862; hæmorrhage October 9th, radial artery ligated in upper extremity only; duty February 13, 1863. Serg't O. P. Babcock, Co. H, 207th Pennsylvania, left radius, Petersburg, April 2, 1865; hæmorrhage April 12th, proximal and distal ends of recurrent branch of radial artery ligated; discharged June 2, 1865. Pt. W. A. Hannabaugh, Co. A, 26th Pennsylvania, left radius, Gettysburg, July 3, 1863; hæmorrhage July 19th, one end of radial artery tied in wound; discharged February 9, 1864. Pt. C. H. Cottrell, Co. I, 7th New Jersey, left radius, Spotsylvania, May 10, 1864; hæmorrhage, radial ligated; duty October 17, 1864. Pt. S. Smith, Co. H, 74th Ohio, left radius, Lookout Mountain, October 2, 1863; sloughing and hæmorrhage May 24th, ligation of superior extremity of radial; duty November 20, 1863.

[2] Pt. M. Perman, Co. F, 2d New Jersey Cavalry, aged 23 years, right radius, Bolivar, Tennessee, May 2, 1864: gangrene, hæmorrhage, brachial ligated June 21st; discharged September 25, 1864. Pt. T. J. Smith, Co. A, 6th Iowa, aged 22 years, Shiloh, April 6, 1862; hæmorrhage April 24th, ligation of brachial artery; discharged March 19, 1863. Pt. H. Letterman, Co. K, 67th Pennsylvania, aged 36 years, left radius, Cold Harbor, June 3, 1864; hæmorrhage July 13th, from radial artery, brachial tied; discharged March 1, 1865. Pt. C. C. Powers, Co. A, 40th Iowa, left radius, accident, June 13, 1865; hæmorrhage June 17, 1865, ligation of brachial; recovered. Pt. M. H. Hardy, General Service, radius, accident, 1862, brachial ligated; discharged February 26, 1863.

HOSPITAL GANGRENE

In numerous cases, there was extended necrosis of the diaphysis; in some instances long cylindrical sequestra being eliminated:

CASE 1876.—Corporal I. H. Rawlins, Co. E, 76th Pennsylvania, aged 20 years, was wounded at Pocotaligo, October 22, 1862. Surgeon R. B. Bontecou, U. S. V., in charge of Hospital No. 1, Beaufort, noted: "He was admitted, October 24th, with gunshot wound of right forearm, a portion of shell having entered far enough to break the radius two inches above the wrist, and not tearing the coat. The fracture was a simple one, and the wound slight. A straight splint to the palmar aspect of the forearm was applied, and lint with cerate to the wound. December 1st, the patient has required very little attention, the injury of the arm not disturbing his general health nor creating much local disturbance. He has been dressed and about the ward nearly all the while since his admission. December 20th, arm sound; bone a little enlarged by callus, but the patient is considered well, and sent to-day to his regiment." Surgeon M. A. Withers, 6th Connecticut, recorded this man's admission and treatment for nearly three weeks at the regimental hospital during the following month—January, 1863. On November 28, 1864, Corporal Rawlins was mustered out of service and pensioned. Examiner J. Phillips, of Washington, D. C., May 16, 1867, certified: "* * Fracture of radius; the tendons of the extensor muscles injured: the strength of the arm and hand somewhat impaired." Examiner D. S. Hays, of Hollidaysburg, Pa., certified, March 12, 1872: "* * The original wound has recently reopened, caused by exfoliation of bone, and presents an unhealthy, dark, inflamed appearance, surrounded by a large purple areola. There is considerable suffering, and the applicant is unable to use the arm to any extent. A partially detached spicula can be felt." An Examining Board, consisting of Drs. Hays and G. W. Smith, certified, September 4, 1873: "* * Necrosis of bone and loss of pronation and supination," etc. The same Board reported, July 1, 1874, that they found "the cicatrix red and somewhat tender; some enlargement of joint; pronation and supination somewhat impaired though tolerably good; wrist not as strong as natural, and functionally impaired. The wound reopened some months ago, but is now well. There is no evidence of its reopening." This pensioner was paid September 4, 1875.

CASE 1877.—Private R. Hotz, Co. I, 183d Pennsylvania, aged 29 years, was wounded at Cold Harbor, June 3, 1864, and admitted to the field hospital of the 1st division, Second Corps, where Surgeon W. S. Cooper, 125th New York, noted: "Gunshot wound of arm." On June 7th, the wounded man entered Harewood Hospital, Washington, and several days afterward he was transferred to Philadelphia. Surgeon L. Taylor, U. S. A., in charge of McClellan Hospital, made the following detailed report of the case: "He was wounded by a minié ball, which entered on the lower part of the posterior surface of the left forearm and came out immediately opposite the orifice of entrance, fracturing the radius, through which it passed. The patient was admitted to this hospital on June 13th, the lower wound being in a sloughing condition. It ceased sloughing by June 20th, and did well until July 1st, when the opening began again to increase in size. On July 28th, an abscess, pointing half way up the forearm, was opened; a probe introduced detected the presence of necrosed bone. The wound caused by the entrance of the ball had healed entirely about this time, while that of exit continued sloughing at intervals until September 1st, when it began to present a healthy appearance. It was now evident that a large portion of the radius was entirely necrosed. On September 3d, an incision was made from the cicatrized wound of entrance to near the elbow, on the posterior surface of the forearm, passing through the opening previously made, July 28th; the muscles were partly cut and partly torn apart, when a portion of the radius, six inches long, was found nearly loose, and was removed without any trouble. It was partly surrounded by callus. The wound was closed with sutures and adhesive plaster, and has since done well. The operation was performed by Acting Assistant Surgeon W. L. Wells. October 30th, the patient has some motion of the little finger, and there is prospect of the hand becoming useful to a slight degree." The sequestrum was contributed to the Museum by the operator, and is represented in the annexed wood-cut (FIG. 669). Its middle third occupies the totality of the bone, about one-third of the circumference being wanting at the extremities. There is an osseous deposit upon the middle of the specimen. The patient was discharged from service February 1, 1865, and pensioned.

FIG. 669.—Sequestrum from left radius. *Spec.* 3672.

CASE 1878.—Private J. C. Roberts, Co. C, 26th New York, aged 18 years, was wounded in the left forearm at Antietam, September 17, 1862. Three days afterward he was admitted to Newton University Hospital, Baltimore, whence Surgeon C. W. Jones, U. S. V., furnished the following history: "He was wounded by a minié ball, which passed through the forearm, fracturing the radius. The ball entered the middle of the forearm upon its anterior aspect, and passed out about two inches below the elbow, on the posterior side. The wounds were dressed with cold water and lint. On the first, second, and third days of October, secondary hæmorrhages occurred, which were restrained by temporary compression of the brachial artery and the injection of solution of persulphate of iron. The probable loss of blood amounted to sixteen ounces, and the probable source of the hæmorrhage was the interosseous artery. On October 4th, an abscess being opened on the posterior aspect of the middle of the forearm, Surgeon C. W. Jones, U. S. V., removed four large fragments of the radius varying from one to two inches in length. A sponge tent was then inserted and allowed to remain until the next morning, when a poultice was applied to soften and favor its removal, which was afterward accomplished. The dressing of cold water and lint was then resumed, and was followed by rapid improvement in the condition of the patient. At this time—November 8th—the arm is nearly well." The removed fragments were contributed to the Museum by the operator (*Cat. Surg. Sect.*, 1866, p. 191, *Spec.* 407). The patient was discharged from service December 18, 1862, by reason of "partial anchylosis of the elbow joint and atrophy of hand, resulting from the wound." Examiner H. B. Day, of Utica, New York, January 10, 1863, certified: "Gunshot wound in left arm, shattering the radius. Pieces of bone have been taken from the wound. * * * Wound still suppurating; forearm perfectly useless." The Utica Examining Board, consisting of Drs. H. B. Day and S. B. Coventry, certified, November 27, 1863: "The wrist joint is distorted from loss of portions of the radius and laceration of the flexors of the wrist and fingers." Examiner G. W. Avery, of Norwich, reported, September 4, 1873: "The act of pronating and supinating the forearm is much impeded." The pensioner was paid September 4, 1875.

There were no less than one hundred and forty-seven instances among the recoveries, in which considerable fragments were removed or necrosed sequestra were extracted.

CASE 1879.—Private J. V. Davis, Co. C, 76th Pennsylvania, aged 18 years, was wounded at Pocotaligo, October 22, 1862, and admitted to Hospital No. 1, Beaufort, two days afterward. Surgeon R. B. Bontecou, U. S. V., recorded: "Gunshot wound of left forearm, the ball entering the outside at the middle of the radius, and, passing obliquely through that bone near the elbow joint, emerged in front of the inner condyle, at the flexure; then again entered the arm two inches above that point, and, after passing under the integuments about one inch, emerged at the inner side of the arm just above the inner condyle, making four wounds. The radius was somewhat comminuted and the short upper extremity drawn upward and inward by the biceps. I kept the arm well flexed, and by compresses and splints corrected this displacement somewhat. The swelling and inflammation that followed was slight. November 15th, fluctuation at the middle of the forearm anteriorly led me to lay open the fascia to some extent, and with the finger and forceps removed some sequestra which had become detached. December 1st, splint still worn, and yesterday another sequestrum removed, after dilating the wound with sponge-tent twenty-four hours. December 29th, patient has union of radius and has been without a splint ten days; will be sent to his regiment soon. His health has not been affected since the wounding. The upper fragment could not be kept in line, and I perceive the union will be weak. February 6th, patient sent to his regiment." He was discharged from his regiment March 3, 1863, and pensioned. Examiner D. S. Hays, of Hollidaysburg, Pennsylvania, certified: "The ball penetrated the arm about the middle and emerged near the bend of the elbow, comminuting the radius, a considerable portion of which was evidently removed in its continuity. The bones are forced together at the interosseous space, with vicious union and resulting partial destruction of pronation and supination. There is considerable deformity, and incurable loss of complete use of the limb," &c. Drs. A. S. Dunlop and J. S. Beck, of the Dayton National Military Asylum Board, July, 1871, reported: "* * * There is necrosis of both bones of forearm. Partial anchylosis of elbow joint. Rotation is but imperfect. There is an unreduced dislocation of the ulna at the wrist joint, leaving great deformity," &c. Examiner W. M. Wright, of the Hampton Military Asylum, September 5, 1873, certified: "* * * The injury has produced extensive adhesions and lesion of most of the muscles of the forearm, especially of the flexor longus pollices, pronator quadratus, supinator radii longus, extensor carpi radialis longior, and other important muscles connected with the movements of the arm and hand." The pensioner was paid September 4, 1875.

§ *Fatal Cases of Shot Fracture of the Radius treated by Expectation.*—There were fifty deaths among the thousand and nine cases of this category. In five, pyæmia was reported as the proximate fatal cause. The following is one of these cases:

CASE 1880.—Private S. McCan, Co. F, 1st Cavalry, aged 23 years, was wounded in the right forearm, at Funkstown, July 8, 1863, and entered Frederick Hospital one week afterward. Acting Assistant Surgeon W. S. Adams contributed the specimen (FIG. 670) with the following history: "A fragment of shell produced a compound comminuted fracture of the right ulna. The fragments had been removed prior to admission, and the wound was granulating nicely. His general condition was fair; appetite good. Ordered simple dressings and generous diet. August 2d, patient has been doing well up to yesterday, walking about the hospital grounds at will. At about 5 P. M. he was attacked with chilliness and went to bed, and this morning I found him with considerable fever, skin hot and dry, pulse 100, tongue somewhat furred, face flushed, slight headache, and total loss of appetite. 3d, patient slightly delirious; pulse 120; slight diarrhœa; complains of tenderness over the right iliac region, and a gurgling sound is produced on pressure. Ordered stimulants, astringents, and tonics. 4th, diarrhœa no better; tympanitis well marked; tongue dry and brown. Treatment continued. 6th, delirium still continues; tongue cracked; the wound discharges less freely and this morning presents a sloughy appearance; pulse 130. Continued the treatment and applied acid lotion to wound. 6 P. M., slight hæmorrhage has just taken place; no bleeding vessel can be found; it seems to be a general oozing from the granulations. 7th, several well-marked rose spots are observed in the epigastric region; diarrhœa still exists; sordes on the teeth. Ordered stimulants to be increased, and a wineglassful of milk-punch every hour. 9th, rose spots quite numerous this forenoon. Patient is evidently growing worse. At 6 P. M. he had a severe chill. 10th, patient evidently sinking. He died at mid-day. *Sectio-cadaveris* eight hours after death: rigor mortis complete. On opening the chest, found left pleural cavity containing about a pint of yellow sero-purulent fluid; lungs heavily coated with broken-down lymph; substance of lungs highly engorged—left lung highly congested, but containing no abscesses; right lung literally filled with small circumscribed abscesses. Weight of lungs one pound and nine ounces each. Liver weighed five pounds and two ounces, and contained three abscesses, holding about two ounces of pus each. Heart healthy and weighing seven ounces. Spleen weighed ten ounces and hyperæmic; kidneys six ounces and much congested. The carpus was found filled with pus, and the ulna stripped of periosteum for the space of three inches above the point of the injury and down to the wrist joint." The specimen consists of the bones of the forearm, and shows comminution of the ulna in the lowest third. The lower extremity is necrosed, which condition extends superficially up two-thirds of the shaft.

FIG. 670.—Shell fracture of right ulna and radius. *Spec.* 3889.

In six cases,[1] secondary hæmorrhage induced the fatal result. An example is given in CASE 1883, on the opposite page. Two patients succumbed from tetanus, one from gangrene, and in two instances, which are detailed on the next page, severe erysipelatous inflammation

[1] One, Pt. W. H. Croyle, Co. H, 55th Pa., died after ligation of the ulna. Lamareaux (CASE 1883, p. 931) and Serg't Pieffer, Co. I, 5th Mich., fracture of radius, Petersburg, September 3, 1864, died after ligations of the radial. Three patients treated by styptics and pressure succumbed: Pte. G. Tumbgin, 20th Indiana; J. W. Jones, 1st Mass. Art.; *J. Quick*, 25th South Carolina.

preceded the fatal issue. The majority of the patients died from exhaustion from protracted suppuration, or from intercurrent affections arising during their treatment in hospitals.

Case 1881.—Private M. Poquett, Co. A, 33d New York, aged 30 years, was wounded at Chancellorsville, May 3, 1863. Surgeon D. E. Dickerson, of the regiment, recorded the injury as "Gunshot fracture of right forearm," and the man's transfer to General Hospital May 7th. On the following day the patient entered Douglas Hospital, Washington, whence Assistant Surgeon W. Thomson furnished the following history: "He was struck by a bullet, which passed through his right arm, fracturing the radius, and then caused a flesh wound over the ninth rib. At time of admission had diffused erysipelas extending to the shoulder, which yielded to local use of tincture of iodine, etc. There was copious discharge from the arm. On the 19th, the erysipelas recurred, and was successfully treated by one-drop doses of bromine internally. His general condition, however, was improving, and on the 21st he suffered from dyspnœa and pain in the chest. This increased rapidly, and was supposed to be due to acute capillary bronchitis. He finally died, on June 22, 1863. Autopsy: There were adhesions in the right pleural cavity, with serum in both pleural cavities. The mucous membrane lining the bronchial tubes was strongly injected; both lungs seemed to be much congested, sinking in water, but with no hepatization. A fracture of the radius, surrounded by a fibrous investment and in a fair way to be united, was found, which is now forwarded." The specimen is represented in the adjacent wood-cut (Fig. 671), and shows a few necrosed splinters entangled in the callus that was thrown out.

Fig. 671.—Right radius fractured in middle third. *Spec.* 1341.

Case 1882.—Private D. Scott, Co. A, 1st Kansas Colored Troops, was wounded on April 10, 1864, and entered the Little Rock Hospital May 4th. Assistant Surgeon R. M. Lackey, U. S. V., recorded: "Gunshot wound of forearm. Patient returned to duty May 9th; readmitted with same wound September 11th, and returned to duty November 24th; readmitted with erysipelas December 2d, and died April 2, 1865." An account of this case was reported to Surgeon J. R. Smith, U. S. A., Medical Director of the Department of Arkansas, by Acting Assistant Surgeon H. S. Hannen, as follows: "The patient was wounded at Poison Springs, while with a foraging party, by a minié ball, which made its entrance at the lower third of the right forearm, fracturing the radius, and passing downward to the carpus produced a dislocation of the ulnar portion of the carpus, where it made its exit. Nothing had been done for the patient's arm previous to his admission to this hospital. About one week after his admission a reduction was attempted, but the case having been neglected so long the parts could not be reduced, and a bandage was applied and the wound dressed with simple cerate. The patient's general condition, when he came under treatment, was good, and continued so until March 26th, when he was seized with an attack of erysipelas which affected his face and neck severely. The usual remedies were resorted to but proved unsuccessful, and he died April 2, 1865. I would remark that the patient had recovered sufficiently to be able to assist at the work in the kitchen, and could use his arm quite well except that he could not supinate or pronate, and there was some stiffness of the carpus and a dislocation of the extremity of the ulna, the arm presenting a very crooked appearance. I made an examination of his arm and wrist and had the carpal bones prepared, but having become detached from the radius and ulna they were lost. Thinking the remaining portion of the preparation would be of interest, I beg leave to present them with the foregoing history, which is all I can learn. * * " The specimen, represented in the annexed wood-cut (Fig. 672), was forwarded to the Museum by Surgeon Smith. The radius has been shattered for two inches; a fair osseous deposit has occurred, but actual union has obtained only for a volume of one-fourth the normal size.

Fig. 672.—Lower portions of radius and ulna, the former partly repaired after shot fracture. *Spec.* 4.

Case 1883.—Corporal A. Lamareaux, Co. E, 124th New York, aged 20 years, was wounded near Hatcher's Run, April 1, 1865, and admitted to the field hospital of the 3d division, Second Corps, where Surgeon O. Everts, 20th Indiana, recorded: "Gunshot wound of left arm." On April 5th, the man entered Douglas Hospital, Washington, whence Assistant Surgeon W. F. Norris, U. S. A., contributed the specimen (Fig. 673), together with the following description of the injury and operations which he performed: "Gunshot fracture of left radius. The ball was found to have entered the forearm from behind, fracturing the radius near its head, and lodging above the elbow joint in the arm. When admitted, the general condition of the patient was unfavorable, being feverish and without appetite; pulse 110. He stated that there was profuse hæmorrhage at the time of the injury. The parts were not healthy looking, the arm somewhat swollen and hot, and the hand œdematous. On April 6th the bullet was extracted, two counter-openings being made. On April 9th, secondary hæmorrhage occurred to the amount of six ounces, which ceased spontaneously. Another hæmorrhage occurred on the 13th, and two attacks took place on the 14th, the last two being very slight. The parts were still much swollen and painful, discharge profuse, tongue dry, and countenance pale. Patient has considerable pain in chest, and dyspnœa, but no cough, and is rapidly losing strength. On April 15th there was hæmorrhage, amounting to three ounces, at 8 A. M., which ceased upon slight compression of the brachial, but recurred at 12 M. to the amount of eight ounces, when the brachial artery was ligated in its continuity. The areolar tissue was found filled with clots of blood. The patient was almost moribund, and the operation was only a temporary measure, and was performed to render the patient comfortable, without expectation of saving life. He died of exhaustion, at 2 A. M. the following day, April 16, 1865. The autopsy, twelve hours after death, showed that the radius had been fractured just below the head, also that the radial artery had been severed by the bullet, and that the elbow joint had become secondarily involved. Incipient pneumonia existed in the posterior lobes of both lungs. The other organs were healthy. The specimen consists of the upper halves of the bones of the forearm."

Fig. 673.—Shot fracture of radius. *Spec.* 4186.

§ *Complications.*—Among the twenty-nine hundred and seventy cases of shot fractures of the bones of the forearm treated on the expectant plan, the graver complications were comparatively infrequent. *Pyæmia* supervened in twenty-seven cases, all terminating fatally. One of these (CASE 1880) is detailed on page 930. One case of recovery from *tetanus*, and four fatal cases are reported.[1] There were fifty-seven instances of serious *secondary hæmorrhage*. Forty-four of the patients recovered, the hæmorrhage having been controlled by compression in sixteen cases, and by ligature in twenty-eight cases. Thirteen patients died, nine after treatment by compression and styptics, and four after ligation. In eight instances the brachial was tied at a distance from the wound. In five cases the ulna was ligated. In fourteen cases the radial was tied, distal as well as proximal ligatures being mentioned in two cases. In the remaining case, the interosseous was the vessel secured. *Splinters* were extracted in one hundred and fifty-eight cases.

§ *Treatment.*—The expectant conservative treatment of shot fractures of the ulna and radius was very simple, and, where one bone only was interested, and the injury was uncomplicated, very satisfactory. The limb was laid in semi-pronation on a wide padded splint, supported by a sling. A few loose turns of roller at the upper and lower ends served to secure the splint and to remind the patient not to move the arm, and were so disposed as to permit the application of cold lotions to the wound. In short, the wise counsel of Dr. Stromeyer appears to have been generally followed.[2] Attempts to keep the bones separated by graduated compresses and all tight circular bandaging were found harmful.[3] The various special splints for fractures of the lower part of the radius (to which an ingenious addition was made[4] by the lamented Medical Director H. S. Hewit, FIG. 674) were found inapplicable in shot fractures. Often a wire trough (FIG. 675), or Ahl's felt forearm splint, could be used advantageously, and Medical Inspector Hamilton (*Mil. Surg.*, 1865, p. 395) commended more accurately adjusted apparatus when the inflammatory phenomena had abated.

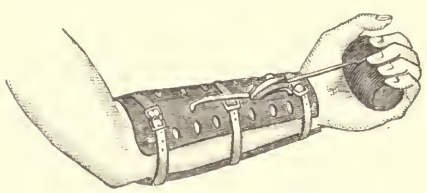

FIG. 674.—Hewit's splint for fractures near the wrist.

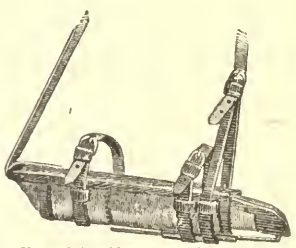

FIG. 675.—Forearm sling of wire gauze. *Spec.* 6359, A. M. M.

[1] Viz: Pt. J. E. Peters, 26th Indiana, fracture of ulna and radius; Pt. P. Loughean, 26th Pennsylvania, and Pt. C. C. Hill, 2d Michigan, with fractures of radius; and Pt. M. White, 111th New York, unspecified shot fracture in forearm.

[2] STROMEYER (L.) (*Maximen*, u. s. w., 1855, S. 703) remarks: "Whatever the injury of the bones of the forearm may be, there is only one proper mode of bandaging, and this consists in the elevated position on a splint, on which there is room for the hand; forearm and hand resting on the volar side. The injured arm must be slightly secured by two broad bandages, which only serve to remind the patient that he must not move his arm. On this splint the arm remains until the healing process is sufficiently advanced to allow the substitution of a sling trough, with which the patient may walk about. . . . I would warn against all attempts to secure the position of the fragments by tight bandaging." The celebrated professor strongly advises against the supine position, as recommended by MALGAIGNE, LONSDALE, SOUTH, NÉLATON, etc.

[3] Several methods of treating fractures of the forearm were proposed that suggest a surprising lack of appreciation of the indications in such cases on the part of their inventors. One (FIG. 676), devised by Dr. J. H. VEDDER (*Am. Med. Times*, 1862, Vol. IV, p. 255), is intended to permit the use of an "extension ratchet pulley" in fractures of the forearm, which seldom has need of extension. The other (FIG. 677) is commended by Surgeon FOSTER SWIFT, 8th New York Militia, who states (*Am. Med. Times*, 1862, Vol. IV, p. 256) that after the battle of Bull Run he was "left with four or five cases of fractured arms, with no appliances for their treatment, and with the prospect of their transportation over a rough road, in rough wagons, to Manassas, and thence to Richmond, without splints and without any light material to make them of," and improvised for the forearm cases a splint such as is shown in the cut. It is somewhat difficult to accept Dr. SWIFT'S assurance, quoted on page 812, NOTE 4, that such appliances "afforded great relief to our wounded men in their jolting journey."

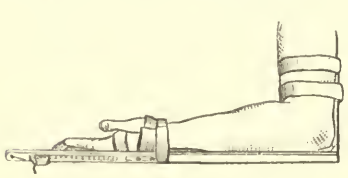

FIG. 676.—Forearm extension splint.

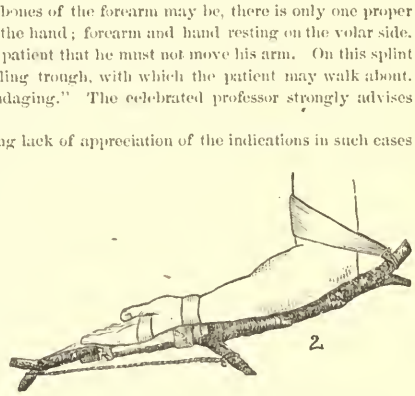

FIG. 677.—Improvised splint.

[4] HEWIT (H. S.), A new splint for fractures of the forearm (*Medical Record*, 1873, Vol. VIII, p. 165).

EXCISIONS IN THE CONTINUITY OF THE BONES OF THE FOREARM FOR SHOT INJURY.—Formal excisions of the shaft of the ulna, or radius, or of both bones[1] were frequently practised, especially as primary operations. If the results were unsatisfactory as regards the average amount of functional utility preserved in the hand, they showed unquestionably a considerably less fatality than was observed in cases treated by amputation in the forearm. The excisions were usually limited to the removal of a few inches of the shaft of one of the bones. The diaphysis of the ulna alone was interested in four hundred and ninety-six, or more than half of the determined cases; the radius alone was resected in four hundred and thirteen cases; portions of the shafts of both bones were excised in fifty-nine, or about 6 per cent. of the cases. In eighteen instances the precise parts excised are unspecified. In the tabular statements the operations have been separated into primary, intermediary, secondary, and subdivided into successful and fatal groups. There would be too great complexity in arranging the tables according to the parts interested; but this division is observed partially in the illustrative cases and comments. The following table gives an outline of the results of the several groups:

TABLE CXXV.

Numerical Statement of Nine Hundred and Eighty-six Cases of Excisions in the Forearm for Shot Injury.

OPERATIONS.	TOTAL CASES.	RECOVERIES.	FATAL CASES.	RESULT UNKNOWN.	MORTALITY RATE, DETERMINED CASES.
PRIMARY	665	589	71	5	10.7
INTERMEDIARY	149	120	29	.....	19.4
SECONDARY	40	36	4	.....	10.0
TIME OF OPERATION UNKNOWN.	132	111	5	16	4.3
Aggregates	986	856	109	21	11.2

The uniformity of the death-rate in the several series indicates that the stage at which the excisions were done had far less influence on the gravity of the operations than is observed in operations of greater magnitude. Recourse was had to consecutive amputations in seventy-six cases; a much smaller proportion than obtained in the series of excisions in the shaft of the humerus.

PRIMARY EXCISIONS IN THE SHAFT OF THE ULNA, OF THE RADIUS, OR OF BOTH BONES. There were five hundred and eighty-nine recoveries, and seventy-one deaths, in the series of six hundred and sixty-five primary excisions, the results remaining undetermined in five instances. The excisions involved the ulna in three hundred and twenty-one cases, the radius in two hundred and ninety-one, both bones in forty cases, and the seat of excision was unspecified in thirteen instances. The operations were performed on six hundred and twenty-one Union and forty-four Confederate soldiers.

Recoveries after Primary Excision in the Forearm.—Some examples of the excisions

[1] Excision in the shafts of these bones for shot injury has not, until recently, been regarded as an accepted resource of surgery, and its value is still *sub judice*. BILGUER, in the Seven Years' War, 1756–63, would appear to have been the earliest to perform an operation to which this name might be applied. BAUDENS, in the Algerian campaigns, stoutly advocated the excisions in the continuity of these and other long bones; and LANGENBECK and his followers practised operations of this sort in Sleswick-Holstein. The historical relations of each of the special operations will be noticed more in detail further on.

in the shafts of both bones, of the ulna alone, and of the radius, will precede the general tabular enumeration, presenting details of the principal varieties of the several operations.

EXCISIONS IN SHAFTS OF ULNA AND RADIUS.—Of the forty primary excisions of this nature,[1] thirty-four were successful in the *quoad vitam* sense; but many of the patients recovered with useless limbs, and several only after submitting to amputation. Not a single really good result is noted among the twenty-two patients who retained their limbs.

CASE 1884.—Private J. G. Frederick, Co. E, 103d Illinois, aged 26 years, was wounded at Mission Ridge, November 25, 1863, and admitted to the field hospital of the 4th division, Fifteenth Corps. Surgeon W. W. Bridge, 46th Ohio, recorded: "Gunshot wound of left forearm; resection of radius and ulna. Patient sent to general hospital December 20th." Assistant Surgeon R. Bartholow, U. S. A., reported the man's admission to the general field hospital, Chattanooga, with "gunshot fracture of left forearm," and his transfer to Nashville January 30th. On the following day the patient was admitted to Hospital No. 1, Nashville, whence Surgeon R. L. Stanford made the following report of the case: "The ball entered three inches below the elbow joint, producing a compound comminuted fracture of the ulna and the radius. Resection was performed the same day, three inches of both bones being removed. When admitted, the arm was loosely confined in a sling. No union had taken place. The wound was discharging freely, both by the original opening and also by the counter-opening above. Brought the bones in apposition and applied splints. March 23d, suppuration is still going on, and no union is taking place. Chloroform being administered, the wound was examined and the ends of the bones found to be necrosed. The arm was then amputated above the elbow, by the circular method, by Medical Cadet C. H. Fisher. The treatment after the operation consisted of simple dressings, stimulants, and good supporting diet." (Compare Case 48, TABLE LXXXVI, p. 785.) The amputated bones of the forearm were contributed to the Museum by the operator, and are represented in the cut (FIG. 678). The extremities of the bones are carious. On October 15th, the patient was transferred to Joe Holt Hospital, Jeffersonville, whence he was discharged February 14 1865, and pensioned. In his application for commutation, dated 1870, the pensioner described "the condition of the stump as sound and strong." He was paid September 4, 1875.

FIG. 678.—Left ulna and radius resected in the continuity for shot fracture, and subsequently removed by amputation of the arm. *Spec.* 2206.

CASE 1885.—Corporal M. Huntley, Co. A, 2d Massachusetts, aged 24 years, was wounded at Gettysburg, July 3, 1863, receiving a comminuted fracture of both bones of the right forearm from a musket ball. Resection of several inches of the lower portion of the shafts of the ulna and radius was practised on the field soon after the injury, by the regimental surgeon, Dr. W. H. Heath. The patient was sent to York, Pennsylvania, on July 18th. Surgeon H. Palmer, U. S. V., reported that: "A minié ball entered the radial border of the right forearm at the junction of the upper and middle thirds, passed outward and downward, and emerged at the lower third of the ulnar border, comminuting both bones. Four inches of the continuity of each bone was excised the same day, and the limb was placed on a flat splint with cold-water compresses. This soldier was discharged March 28, 1864, and pensioned. The discharge certificate stated that there was no bony union, and that the functions of the hand were nearly destroyed." Examiner G. S. Jones, August 29, 1866, recited the preceding facts, and stated that "the forearm and hand are powerless and useless." Examiner N. Allen, of Lowell, reported, September 4, 1873: "Huntley's disability remains without change. It consists of a false joint near the right wrist; * * * the hand is sustained by the muscles and ligaments—swinging this way and that, so that the hand and the whole arm are of but little use, in some respects worse than no hand or arm; but, by applying support and bandages, the hand is kept in its place, making a better appearance than good use."

The operations were on the right side in eighteen, the left in fourteen, and unspecified in two of the thirty-four recoveries—on the right in one, and the left in five fatal cases.

EXCISIONS IN SHAFT OF ULNA.—Two hundred and ninety patients recovered after excisions in the continuity of the ulna; a hundred and fifty-two of the operations were on the right, a hundred and thirty-two on the left side, and were unspecified in six cases.

[1] Dr. O. HEYFELDER and others assert that BILGUER, SAINTE-HILAIRE, and FRICKE were among the earliest to resect simultaneously portions of the shafts of both bones of the forearm. The fact is that BILGUER (J. U.) (*Chirurgische Wahrnehmungen*, Berlin, 1763, S. 479, Case 99) relates the case of: "An hussar, Christoph Kasbad, of the regiment Dingelstädt, whose forearm bones were so badly fractured that it became necessary to remove, with the trepan, one of the largest pieces." The patient recovered with good use of the forearm. M. de SAINTE-HILAIRE (*Considerations sur les os de l'avant bras*, Paris, 1814, p. 10) records that in a case of compound fracture, or rather of epiphyseal separation of the lower ends of the bones of the forearm, he found it necessary to resect the protruding ends of the ulna and radius before they could be reduced. FRICKE (J. C. B.) (*Annalen der chirurgischen Abtheilung des allgemeinen Krankenhauses in Hamburg*, 1828, p. 389, copied in *Hamburger Zeitschrift*, B. III, S. 458) excised, in 1826, the middle portions of the radius and ulna for pseudarthrosis following fracture from a fall; two inches of each bone were removed. To these may be added a successful case communicated, in 1829, to the Academy of Medicine of Paris, by HUBLIER, chief surgeon to the Hotel-Dieu, of Provins. The forearm of a woman of 33 years was crushed under the wheel of a heavy carriage, and the displaced bones of the forearm perforated the soft parts, the ulna protruding fully an inch and a half. After eleven days the fractured portions of the radius and ulna were resected, "with entire success." MM. ROUX, RIBES, and HERVEZ DE CHÉGOIN made a flattering report on the operation (*Arch. gén. de Méd.*, 1829, T. XX, p. 291). According to RIED (F.) (*Die Resectionen*, Nürenberg, 1860, S. 349), HOLSCHER also, in 1830, resected the continuity of the bones of the forearm successfully in a case of pseudarthrosis. In KIRKBRIDE'S *Clinical Reports* (*Am. Jour. Med. Sci.*, 1835, Vol. XVII, p. 40) a case is recorded of ununited fracture of both bones of the left forearm, in a shoemaker, aged 24 years, treated unsuccessfully by seton and caustic, when Dr. THOMAS HARRIS, U. S. N., April 24, 1833, turned out and excised the ends of the radius and ulna, after which both bones united. There may also be compared the interesting cases of shot comminution of the bones of the forearm in which BORDENAVE (*Obs. sur les Plaies d'armes à feu*, in *Mém. de l'Acad. de Chir.*, 1753, T. II, p. 529) removed large fragments of both bones without formal resection. VELPEAU cites these cases as resections in his article on excisions in the forearm (*Méd. Op.*, 1839, T. II, p. 563).

CASE 1886.—Private T. Christie, Co. A, 131st New York, aged 44 years, was wounded at Port Hudson, May 27, 1863, and admitted to the field hospital of the 1st division, Nineteenth Corps, where Surgeon M. D. Benedict, 75th New York, noted: "Gunshot wound of arm and side." Surgeon A. L. Van Nostrand, 4th Wisconsin Cavalry, recorded the wounded man's admission to hospital at Baton Rouge, May 31st, with "grapeshot wound through lumbar region." Surgeon B. A. Clements, U. S. A., in charge of Central Park Hospital, New York City, reported as follows: "The patient was admitted January 14, 1864, being transferred here from the Theatre Hospital, Baton Rouge. He stated that the ball struck the left arm while hanging by the side, fracturing the ulna at the junction of the middle with the lower third. It entered the left side about one inch above the crest of the ilium and four inches from the centre of the spinal column, passing backward and a little downward, and escaping just to the right of the median line of the back. The spinous processes were not fractured. For two months had hæmaturia; diarrhœa three days after the injury. Four hours after the reception of the injury resection of five inches of the ulna was performed.

FIG. 679.—Appearances after an excision in the shaft of the left ulna for shot fracture. [From a cast in the Museum.] *Spec.* 2386.

On admission all the wounds had healed; flexion and extension good; partial anchylosis of wrist; rotation very fair. Can grasp very well with the index finger and thumb, with very little power in the other fingers. General condition good. Complains of tenderness and pain of left side and back, in region of wound. Discharged from service April 16, 1864." A cast of the wounded forearm, made ten months after the date of the injury, was contributed to the Museum by Assistant Surgeon J. W. S. Gouley, U. S. A., and is represented in the adjacent wood-cut (FIG. 679). A cicatrix nearly two inches long by one-fourth inch deep marks where fragments have been removed, and where it is probable union has not occurred. The muscular portion of the lower half of the forearm is atrophied. The New York Examining Board certified, January 17, 1872: "Resection of four inches of left ulna without reproduction of bone; pronation and supination almost destroyed; very little muscular power in the hand. The forearm and hand are useless for the purposes of manual labor." The pensioner was paid September 4, 1875.[1]

CASE 1887.—Private C. O'Neill, Co. F, 10th New York, aged 35 years, was wounded at Spottsylvania, May 10, 1864, and admitted to the field hospital of the 2d division, Second Corps, where Surgeon J. F. Dyer, 19th Massachusetts, noted: "Gunshot fracture of right forearm; excision of ulna by Surgeon M. Rizer, 72d Pennsylvania." Surgeon C. Page, U. S. A., reported the wounded man's admission to Wolf Street Hospital, Alexandria, with "gunshot fracture of the right upper extremity." On June 4th, the patient entered Central Park Hospital, New York City, whence Acting Assistant Surgeon S. Teats reported the following history: "Wounded by a musket ball, which struck the forearm on the ulnar aspect, about the middle, fractured that bone, and passed through the arm without fracturing the radius. He received two other gunshot wounds at the same time, one on the internal aspect of the left arm two inches above the elbow joint, the other two inches below the elbow, on the internal aspect of the forearm. Resection of the ulna was performed May 11th, under chloroform, three inches at least of the bone being removed by a straight incision. The parts were drawn together by sutures, after which water dressings were used. On admission, the flesh wounds were healed and the fractured arm nearly so; patient debilitated and pale from loss of blood. June 10th, improving. July 1st, mental derangement; wound doing well. 9th, had improved in his mental condition so much that he was allowed to walk about the hospital. While walking on a porch of the hospital he suddenly jumped off, and fractured his right tibia and fibula at the middle, both bones very obliquely broken without the skin being ruptured. Much ecchymosis and swelling soon followed. Extension was applied and cold water used. 15th, swelling very much diminished; bandage and lateral splints applied. Mental condition, partially deranged but not violent. Put on a plaster apparatus. October 19th, removed the plaster apparatus, the bones being well united." The patient was discharged from service August 11, 1865, and pensioned. A cast of the injured forearm (FIG. 680) was made in New York three months after the reception of the injury, and contributed by Acting Assistant Surgeon G. F. Shrady. This pensioner died in 1866.

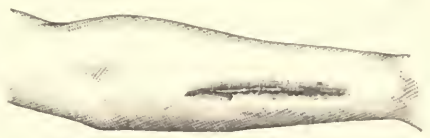

FIG. 680.—Appearances after an extensive excision in the shaft of right ulna. [From a plaster cast.] *Spec.* 4365.

---

[1] The history of excisions in the shaft of the ulna is sketched in brief by VELPEAU (*Nouv. élém. de Méd. Opér.*, 1839, T. II, p. 648), whose researches have been accepted by subsequent writers with scanty acknowledgment. We will avail of such of his references as we have verified, and make some additions. He tells us that SCULTETUS (*Armamentarium chirurgicum* XLIII *tabulis exornatum*, Gallice, Lyon, 1675, Tab. XXVIII, p. 83) excised a long invaginated sequestrum of the ulna. CASPAR PETZOLD (*Obs. med. chir. select.*, Breslau, 1715, p. 128) relates that AMBRUSTUS extracted thirty fragments of the ulna from a student suffering spino ventosa of that bone. A successful resection or rasping of the ulna for caries is ascribed to ROLANDUS, on the authority of BONETUS (*Sepulchretum*, T. IV, p. 116). L. CHAMPION relates (*Traité de la resection des os cariés dans leur continuité, ou hors des articulations*, Paris, 1815) that "M. DUPUYTREN m'a fait part du cas d'un militaire qui avait perdu une portion assez considérable de toute l'épaisseur du corps du cubitus, sans qu'il se soit opéré de changement dans la forme du bras." WITHUSEN (*Acta nov. Soc. med.*, Havniæ, V. III) in 1819 successfully resected a portion of the shaft of the ulna for exostosis. ROBERT B. BUTT, of Portsmouth, Virginia (*Phila. Jour. of Med. and Phys. Sci.*, 1825, Vol. I, p. 115), excised (in 1821 or '22) a large involucrum embracing a sequestrum consisting of nearly the whole shaft of the left ulna, in the case of a stout healthy young man of 25, and printed a good illustration of the pathological specimen. The result was so satisfactory that, two or three years after, the man could do the most laborious manual labor, and had as much strength in the mutilated limb as most people have in a sound one. LUIGI CITTADINI (*Osservazioni chirurgische, Frattura non consolidata degli ossi dell' antibraccio curata colla resecazione dei frammenti*, in *Annali Universali de Medicina da* A. OMODEI, Milano, 1826, Vol. XXXVII, p. 412) relates the case of D. Caneschi, a farmer. Both bones of the forearm were fractured in the lower third from a blow with a cane, October 12, 1819. The bones united; the man resumed his avocation too early and the bones separated again, causing a false joint. Resection of both ends of the fractured ulna in January, 1820—patient refused resection of radius. Both bones reunited. MALAGODI (LUIGI) (*Sulla resecazione dell' Ulna*, in *Bullettino delle Science mediche*, Bologna, 1834, Vol. 10, p. 266) relates that on June 29, 1831, he removed nearly the entire diseased shaft of the left ulna, in the case of Barbarini di Mondolfo, aged 20 years. The patient, a laborer, recovered with the full use of his hand, and was able to resume his ordinary avocation. BAUDENS, who became such an advocate of excisions in the continuity of the long bones, relates (*Gaz. med.*, 1838, p. 15) a successful excision of four inches of the ulna for shot injury at the siege of Constantine. RIED (F.) (*Die Resectionen der Knochen*, 1860, S. 347) states that CAJETAN TEXTOR (in 2 cases) and ROTHMUND successfully excised portions of the shaft of the ulna about this period in cases of compound fracture. MURVILLE (*Annales de la Chir.*, 1842, T. IV, p. 181) records a successful excision of the shaft of the ulna comminuted by shot.

The extent of the shaft removed varied from one to six inches or more,[1] comprising, in one instance, the entire diaphysis:

CASE 1888.—Private A. Hyland, Co. B, 2d New York Provisional Cavalry, aged 16 years, was wounded at Smithfield, August 29, 1864, and admitted to the field hospital of the 1st division, Cavalry Corps. Assistant Surgeon C. I. Wilson, U. S. A., noted: "Gunshot fracture of left forearm; patient sent to general hospital." Acting Staff Surgeon N. F. Graham reported the man's admission to hospital at Sandy Hook with "gunshot wound of left forearm." On September 10th he was transferred to Division Hospital No. 1, Annapolis, and on October 24th he entered Central Park Hospital, New York City, whence Acting Assistant Surgeon J. K. Merritt reported: "The patient was wounded by a minié ball, which entered the left forearm at its inner aspect, about two or two and a half inches below the elbow, and passed transversely outward. The ulna was fractured into a number of fragments in its middle third. On the second day after the injury an operation was performed, which resulted in the removal of about four inches of the ulna—according to the statement of the patient. On admission the forearm was considerably swollen, but the incision of the operation was nearly healed, excepting three small openings evidently communicating with necrosed bone. Wound dressed with balsam Peru and forearm supported in pasteboard sling. November 27th, removed a fragment of necrosed bone, being a portion of the excised end of the ulna. Wound dressed with balsam of Peru." A cast of the injured forearm was made about a year after the operation, and contributed by Acting Assistant Surgeon G. F. Shrady (FIG. 681). The patient was temporarily assigned to the Veteran Reserve Corps August 23, 1865, and discharged November 4, 1865, and pensioned, and furnished with an apparatus by Dr. E. D. Hudson. Examiner A. L. Lowell, March 10, 1866, certified: "* * * There is no evidence of injury to important vessels or nerves. Three inches of the ulna have been resected. The shaft of the radius is the only bony support left to the hand. Brachial and muscles of forearm diminished in size, firmness, and efficiency. Temperature of injured arm lower than normal." Examiner P. Treadwell, of New York, Dec. 14, 1869, certified: "* * The limb is distorted and shorter than its fellow." Examiner T. F. Smith reported, Sept. 8, 1873: "There has been no reproduction of bone, and for purposes of manual labor the arm is useless." The pensioner was paid Sept. 4, 1875.

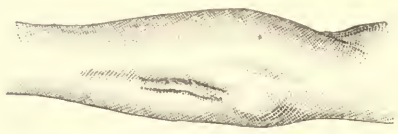

FIG. 681.—Cicatrix after excision in the shaft of the left ulna. [From a cast.] *Spec.* 4360.

CASE 1889.—Musician G. W. Leeti, Co. H, 2d Pennsylvania Veteran Reserves, aged 21 years, was wounded at Petersburg, June 17, 1864, and admitted to the field hospital of the 3d division, Fifth Corps. Surgeon L. W. Read, U. S. V., noted: "Gunshot wound of forearm, severe. Excision of two inches of ulna, by Surgeon W. Lyons, 11th Pennsylvania." The wounded man entered DeCamp Hospital, New York, June 25th, and was subsequently admitted to Satterlee, and lastly to Filbert Street Hospital, Philadelphia, January 17, 1865. Surgeon T. B. Reed, U. S. V., in charge of the latter, recorded: "Gunshot fracture of left ulna by minié ball. Excision of bone before admission. Large open wound in forearm; much attenuated; no use of fingers; arm partially anchylosed at elbow joint. Patient has also pustular eruption in arm and body." The excised parts, consisting of seven small fragments of the ulna, were contributed to the Museum by the operator, and are represented in the annexed cut (FIG. 682). The patient was discharged from service April 24, 1865, and pensioned. Examiner J. H. Oliver, of Philadelphia, December 10, 1867, certified: "It appears that a minié ball entered the anterior surface of the left forearm at the junction of the upper and middle third, passed upward, and made its exit from the posterior inner surface, near the olecranon process, extensively comminuting the ulna, three inches of which has been resected. The adjacent soft parts of the inner side of the forearm have also been carried away by ulceration and otherwise, leaving an extensive though healthy cicatrix. The elbow joint is but slightly affected, but from just below that joint the limb, including the hand, is entirely useless. The ring and index fingers are flexed upon the palm and motionless. The other fingers are not entirely without motion, but the power is so much diminished that the pensioner cannot hold a handkerchief with them." The Philadelphia Examining Board reported, September 8, 1873: "* * Tender puckered cicatrix. Numbness of all parts supplied by ulnar nerve. Atrophy, etc." The pensioner was paid September 4, 1875.

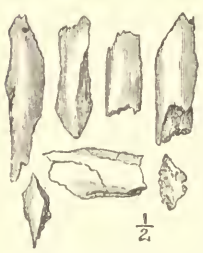

FIG. 682.—Fragments of ulna removed after shot fracture. *Spec.* 4144.

In one curious case, excision was practised in the continuity of the ulna of one limb, and of the radius of the other:

CASE 1890.—Private J. Nugent, Co. F, 49th New York, aged 24 years, was wounded at Spottsylvania, May 10, 1864, and admitted to the field hospital of the 2d division, Sixth Corps. Surgeon S. J. Allen, 4th Vermont, noted: "Gunshot fracture of radius of right forearm and ulna of left forearm. Resection." Surgeon E. Bentley, U. S. V., reported the wounded man's admission to Third Division Hospital, Alexandria, May 24th, with "gunshot fracture of both forearms," and his transfer to the First Division Hospital October 7th. Assistant Surgeon T. G. Mackenzie, U. S. A., reported that the patient was discharged from the latter hospital February 7, 1865, by reason of "resection of both forearms following gunshot wounds." Examiner O. M. Stockwell, of Port Huron, Michigan, December 15, 1865, certified: "Such were the wounds that exsection of a portion of the radius of the right, and ulna of the left, forearm was required. The right is greatly pronated, and no power is left of flexure of the fingers, while the left is of little use except in very light work." On April 6, 1867, he stated: "The exsection was not successful, as the ends of the bones were not brought in apposition or retained there; consequently both are not only much shortened, but twisted or pronated, so as to weaken them very much, and also to make them very inconvenient even in feeding himself." The same examiner subsequently reported that "the disability is almost equivalent to the loss of both hands." The pensioner died November 28, 1872. The immediate cause of death has not been ascertained.

[1] The extent of the shaft removed is unspecified in 59 of the 290 cases. In 3 cases it is reported that 1 inch of the continuity was excised; in 63 cases, an inch and a half or 2 inches; in 88 cases, 2½ or 3 inches; in 47 cases, 3½ or 4 inches; in 10 cases, 5 inches; in 9 cases, 6 inches; in 1 case, the lower half; in 4 cases, the lower third; in 3, the middle third; in 2, the upper third; in 1, the whole diaphysis.

In the cases specially reported as favorable, the pension reports or other ulterior histories almost invariably disappoint the anticipations the first record awakened:

CASE 1891.—Corporal F. M. Gay, Co. F, 12th New Hampshire, age 22 years, was wounded at Cold Harbor, June 3, 1864, and was admitted to Harewood Hospital, Washington, on the 7th. Surgeon R. B. Bontecou, U. S. V., contributed the photograph of the patient, represented by the adjacent wood-cut (FIG. 683), and reported: "Gunshot wound of the left forearm, the ball entering the middle third posteriorly and making its exit anteriorly, fracturing the ulna in its course. June 3, 1864, resection of the ulna of the right side, middle third, three inches of the shaft removed; anæsthetic unknown. Operation performed on the field; operator unknown. Patient states that he was in good health at the time of the operation. Progress was favorable; treatment, simple dressing and supporting diet. Furloughed July 23, 1864." The patient was discharged the service December 3, 1864. In January, 1865, the patient was an applicant for pension, and stated that in addition to the above wound he was continually suffering from a severe form of chronic diarrhœa. In May, 1865, his agent withdrew the claim on account of the death of the soldier, but did not give the date of or cause of death.

FIG. 683.—Appearance after primary excision in the shaft of the left ulna for shot injury. [From a photograph.]

CASE 1892.—Private J. N. Hawkins, Co. F, 40th Illinois, aged 21 years, was wounded at Atlanta, July 28, 1864, and was admitted to a Fifteenth Corps field hospital. Surgeon J. M. Woodworth, 1st Illinois Light Artillery, noted: "Resection of ulna for gunshot wound of the left elbow joint, July 29th. Operator, W. Graham, Surgeon, 40th Illinois." The patient was transferred to the General Field Hospital, at Marietta, on August 9th, and was furloughed on August 12th. The patient was admitted to hospital at Quincy, Illinois, November 17th. Surgeon D. G. Brinton, U. S. V., noted: "Excision of one and a half inches of the ulna." Acting Assistant Surgeon D. C. Owen recorded: "Gunshot wound by minié ball entering the dorsal surface of the wrist one inch above the joint, fracturing the ulna severely. A section of ulna one and a half inches long was removed, by operation by Surgeon Graham, twenty-four hours after reception of the wound. At this date the wound is healed. The hand is almost useless; no treatment; full diet. November 28th, no improvement. December 15th, no improvement; on duty in the ward. January 1, 1865, still on duty in the ward. 24th, discharged from service." Examiner J. Robbins, of Quincy, January 25, 1865, reported: "Ball passed through the forearm about two and a half inches above the wrist joint, shattering the ulna, of which about four inches were removed. Wrist anchylosed. Ring and little fingers of left hand forcibly flexed upon the palm; the other fingers and thumb have slight motion; little strength; hand practically useless." The reports of subsequent examinations are substantially the same as the foregoing. The pensioner was paid June 4, 1874.

EXCISIONS IN THE SHAFT OF THE RADIUS.—Of four hundred and thirteen excisions in the continuity of the radius,[1] two hundred and fifty-six were cases of recovery after primary operations—one hundred and thirty-four on the left, one hundred and fourteen on the right side, and eight unspecified:

CASE 1893.—Private W. K. Gardiner, Co. D, 43d New York, age 42 years, was wounded at the Wilderness, May 6, 1864, and entered Finley Hospital, Washington, on May 17th. Surgeon G. L. Pancoast, U. S. V., reported: "Gunshot wound of left upper extremity." On July 14th the patient was admitted to Ira Harris Hospital, Albany, whence Assistant Surgeon J. H. Armsby, U. S. V., contributed a cast of the injured limb (FIG. 684), with the following description of the wound: "Gunshot fracture of left radius by minié ball. Exsection of portion of the radius was performed on the day of the injury, chloroform being administered; patient in good constitutional condition at the time of operation." The cast was made six months after the date of the operation, and shows a broad oblique cicatrix extending over the dorsal surface, the line at the point of the injury being depressed and union probably not having occurred. The patient was mustered out of service June 16, 1865, and pensioned. Examiner W. H. Craig, of Albany, April 12, 1869, certified: "Ball passed through left forearm near the middle, causing a compound fracture of the radius. The bone is crooked and distorted, causing numbness, weakness, and impaired use of arm and hand." The Albany Board, consisting of Drs. Craig, C. H. Porter, and W. H. Bailey, reported, December 2, 1874: "* * Several pieces of bone were removed, causing some deformity of the arm. Three cicatrices remain which are tender. The rotary motion of the arm and hand are weakened." The same Board again reported, January 5, 1876: "* * The bone was shattered and portions were removed. The cicatrices are tender and the arm is greatly weakened. Within the last six months there has been an ulcer near the wound of exit, owing to the presence of necrosed bone," etc. The pensioner was paid September 4, 1875.

FIG. 684.—Distortion of left forearm after removal of fragments of radius comminuted by shot. [From a cast.] *Spec.* 2671.

[1] L. CHAMPION (*Traité de la Resection des osearies dans leur continuité ou hors des articulations*, Thèse de Paris, 1815, No. 11, p. 57) relates the case of a young peasant in whom the lower third of the radius, becoming necrosed and nearly detached, was cut away by strong pincers by the youth's father. VELPEAU states (*Méd. Op.*, 1836, T. II, p. 650) that a portion of the shaft of the radius affected by necrosis was successfully excised by a chain saw by Dr. FLAMENG, a Hollander (*Dissert. inaug., etc.*, Utrecht, June, 1834,—a paper to which I cannot refer. Dr. HEYFELDER, *Lehrbuch der Resectionen*, 1863, S. 257, refers to this operator as FLEMING. RIED, *Die Resectionen*, 1860, S. 319, by an obvious misprint, styles him HAMENY; and O. HEYFELDER,

The next two abstracts detail the most favorable reported examples of this excision:

CASE 1894.—Corporal P. P. Whitehouse, Co. C, 6th New Hampshire, aged 20 years, was wounded at Spottsylvania, May 12, 1864, and admitted to the field hospital of the 2d division, Ninth Corps, where Surgeon J. Harris, 7th Rhode Island, recorded: "Fracture of forearm; resection by Surgeon J. S. Ross, 11th New Hampshire." On May 24th, the wounded man entered Mount Pleasant Hospital, Washington, whence Assistant Surgeon C. A. McCall, U. S. A., reported his convalescence from a resection of the lower third of the radius for shot fracture. The patient was subsequently treated at the Haddington and South Street Hospitals, Philadelphia, and at Webster Hospital, Manchester. Lastly, he was transferred to Central Park Hospital, New York City, where, on July 10, 1865, he was furnished with an apparatus, designed to promote the mobility of the hand, by Dr. E. D. Hudson. Surgeon J. J. Milhau, U. S. A., reported that the patient was discharged from service August 15, 1865, by reason of "exsection of two inches of the right radius on account of a gunshot wound." A cast (FIG. 685) in this case was contributed by Acting Assistant Surgeon G. F. Shrady. Examiner W. G. Perry certified, March 20, 1866: "The ball lodged in the radius about three inches above its lower end; it was removed and nearly two inches of the bone was taken out. The hand is drawn toward the radial side. The head of the ulna is thrown out; the fingers are stiff, and the hand at present is of no use to him as regards labor." At subsequent examinations Dr. Perry reports substantially the same, and in September, 1873, he adds: "There is no improvement in the disability." This pensioner was paid September 4, 1875.

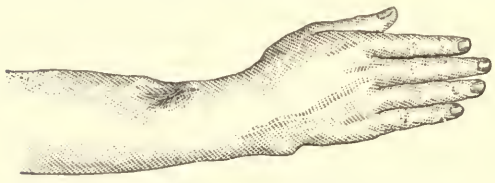

FIG. 685.—Forearm after excision in the lower third of the radius for shot injury. [From a plaster cast.] *Spec.* 4378.

CASE 1895.—Colonel W. H. Penrose, 15th New Jersey, received a wound of the forearm at Cedar Creek, October 19, 1864, and was operated on in a Sixth Corps Hospital by Surgeon J. D. Osborne, 4th New Jersey, who made the following special report: "The Colonel was wounded by a minié ball fired at a distance of twenty yards. The ball passed through the right forearm as it was raised above his head, from before backward, entering on the radial aspect about two inches below the elbow, and making its exit at a point nearly opposite, about one inch below the elbow, fracturing the radius to the extent of three inches and a half, badly comminuting the bone, and driving the fragments into the surrounding tissues. The radial nerve was divided, but the radial artery was uninjured. Eight hours afterward, chloroform was administered, and the wound on the radial aspect was extended to about four inches; the ends of the bone were sawn off by a chain saw and the ends carefully smoothed. The space between the ends of the bone was then about four and a half inches. The wound was then nearly closed by a number of silk sutures, the arm placed in temporary splints, and the next morning the patient was sent to the rear. The subsequent history is described from the Colonel's own statement. No unfavorable results followed, nor was he confined within doors a day. The wound soon healed, but was subsequently opened three times, and each time a small fragment of bone, that had escaped detection at the time of the operation, was removed. He rejoined his brigade for duty in February, 1865, a little more than four months after the injury, and participated in the final movements of the Army of the Potomac in the spring. The wound was permanently healed by May 1st." The photograph, represented by the annexed wood-cut (FIG. 686), forwarded by Dr. Osborne in 1868, shows the condition of the limb at that time: "Arm very slightly bent inward; union, partly bony and partly cartilaginous, is complete between the fractured extremities of the bone. All motions of the arm are retained except rotation, which is lost; the motions of the hand and fingers are retained, except a very slight impairment of the power and motion of the thumb and index finger; anchylosis has taken place in the last joint of the latter; he is perfectly enabled to use both these latter in all movements, such as holding pen, writing, handling knife and fork, etc." Colonel Penrose was promoted Brigadier General of Volunteers July 1, 1865, and was mustered out January 15, 1866, resuming his rank as Captain 3d Infantry, and was found not incapacitated for active duty, by a Retiring Board in 1870, and is still (March, 1876) in service.

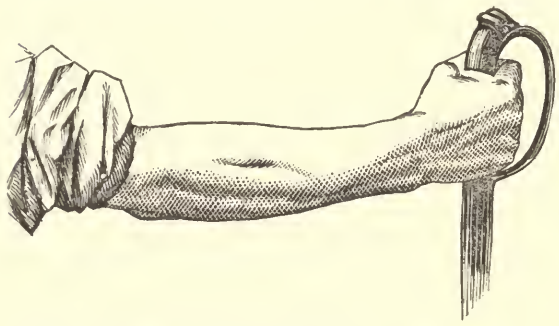

FIG. 686.—Appearances after an excision of the upper portion of the radius for shot injury. [From a photograph.]

quoting from RIED and LISFRANC, converts the observation into two distinct cases), in the case of a soldier who was operated on in 1826, and died in 1832. Dissection showed that a fibro-cartilaginous tissue had replaced the portion of bone removed. (*Compare* LISFRANC, *Précis. de Méd. Opér.*, 1846, T. II, p. 568.) The first excision of the shaft of the radius for shot injury is recorded by Dr. P. FAHNESTOCK, of Pittsburg (*Am. Jour. Med. Sci.*, 1840, Vol. XXVI, p. 91): V. Wyant, aged 23 years, October 14, 1836, received a comminuted fracture of both bones of the forearm about the middle. The ulna formed a ligamentous union, but the ends of the radius remained widely separated. July 25, 1837, Dr. FAHNESTOCK cut down upon the radius, and, dissecting aside the interposed muscular fasciculi, sawed off an inch and a quarter from the end of the lower fragment and three quarters of an inch from the upper fragment with Hey's saw. Fifty-six days afterward the radius had formed firm bony union; subsequently a seton was passed between the ends of the ulna, and ossific union took place. At the assault on Constantine, October 13, 1837, BAUDENS successfully performed a primary excision of three and a half inches of the middle of the shaft of the radius (*Relat. del Exped. de Constantine*, in *Revue de Paris*, Avril 1, 1838); on the same occasion, this surgeon performed five other excisions in the continuity of long bones, in the ulna, humerus, or clavicle. RKLITSKY, chief surgeon of the Morskoy hospital, St. Petersburg, in 1837, removed with the osteotome the entire diaphysis of the radius, leaving the joint ends only, with perfect success; regeneration of bone took place, and in three months the wound had healed, the patient retaining the use of his arm. (See RIVIÈRE, *Observations de resections pratiques dans la continuité des os longs par le docteur* RKLITSKY, *etc.*, in *Gaz. Méd.*, 1840, T. XI, p. 213.) NOODT (*Das Osteotom*, München, 1838, S. 64) states that HEINE, at the hospital at Kronstadt, in 1837, excised a portion of the diaphysis of the radius, 5″ 4‴ in length: the result of the operation is not recorded. J. K. RODGERS, in 1838, removed, with bone pliers, the fractured ends of the radius for pseudarthrosis, in a German, C. Grill, aged 26 years, and united the ends of the bone by silver wire. In 1842, Surgeon C. S. TRIPLER, U. S. A. (*Case of Ununited Fracture of the Forearm, of four years' standing, successfully treated*, in *Maryland Med. and Surg. Jour.*, Vol. III, p. 1), in the case of Lt. F———, 5th Infantry, with pseudarthrosis in

Of recoveries after excisions in the radius or ulna with extreme deformity, of which, unfortunately, a large number are represented in the Museum, the following is an instance:

CASE 1895.—Private J. R. Collett, Co. B, 7th Kentucky, aged 18 years, was wounded and captured at Richmond, August 30, 1862. Having been paroled by the enemy immediately after the battle, he remained in hospital at Richmond for about two months, and was then allowed to proceed to his home, where he was treated for a time by a private physician. He subsequently rejoined his regiment, and was discharged from service March 16, 1864, because of "the effects of a gunshot wound which entirely destroyed the use of his left hand, his right arm also being injured." Examiner E. J. Vaughan, of Louisville, July 21, 1865, certified: "A part of an exploded shell struck the left hand in the palm and passed back and up, severing and fracturing the metacarpal bones of the middle and ring fingers, and fracturing both the radius and ulna up to the upper end of the middle third. The right elbow joint is partially anchylosed from the wound by the fragment of shell and his gun striking it, and cannot be flexed. The hand is not only useless, but it is in the way, and will have to be amputated." Examiner W. W. Potter, of Washington, D. C., reported, May 14, 1869: "Has received a gunshot wound of the left forearm, fracturing the radius and ulna through the shafts, a large number of pieces having been removed. The carpus has sustained extensive injury and a portion appears to have been removed. The extensor tendons are contracted, completely and permanently extending that portion of the hand remaining. The second and third fingers were carried away at the time of the injury, and the thumb with the first and fourth fingers are flexed, thus leaving a deformed and shapeless hand. The other injury was a fracture between the condyles of the right humerus. The olecranon process of the ulna has forced itself upward into the fracture. Union taking place in this condition leaves the joint partially anchylosed; flexion cannot be carried to a right angle, nor extension completely performed." The pensioner has been for some years employed at the Treasury Department. In March, 1868, he visited the Museum, where a cast of his left arm (FIG. 687) was obtained. According to the pensioner, Surgeon W. Berry, 7th Kentucky, excised the greater portion of the shaft of the radius on the third day after the injury. The pensioner was paid September 4, 1875.

FIG. 687.—Deformity resulting from shot injuries of left hand and forearm treated by excision of a large segment of the shaft of the radius. [From a cast in the Museum.] *Spec.* 5004.

TABLE CXXVI.

Summary of Five Hundred and Eighty-nine Cases of Recovery after Primary Excision of Bones of the Forearm for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Ablett, J. W., Pt., I, 7th N. Y. H. A., age 21.	June 3, 3, '64.	Two, left ulna, upper; by Surg. A. Van Devere, 66th N.Y. Dis'd June 15, 1865; pens'd; partial paralysis.	9	Allvord, J., Serg't, G, 96th Penn., age 27.	May 10, 10, '64.	Three, lower, left ulna; by Surg. D. W. Bland, 96th Penn. Dis. Jan. 9, '65; pens'd; adherent cic.
2	Ackerman, J., Pt., K, 27th Indiana, age 22.	May 25, 26, '64.	Three and a half, left ulna, mid. third. Duty Dec. 15, '64; pens'd. Died Jan. 23, 1869.	10	Anaker, A., Pt., B, 40th Indiana, age 20.	May 27, 27, '64.	Left radius, middle; by Surg. E. B. Glick, 40th Indiana. Disch'd January 25, 1865.
3	Adams, T., Pt., 198th Pennsylvania, age 34.	April 1, 1, '65.	Two, left radius, middle. Disch'd Sept. 7, 1865.	11	Anderson, J., Pt., F, 9th New Hampshire.	May—, —, '64.	Three and a half, left ulna. Disch'd October 20, 1864.
4	Agin, W., Pt., G, 1st Cavalry, age 20.	July 18, 18, '64.	Three, left ulna. Duty Jan. 20, 1865; pens'd; large cicatrix.	12	Applebee, C., Pt., D, 11th Vermont, age 18.	Oct. 19, 19, '64.	Two and a half, upper, left ulna. Disch'd May 19, 1865; pens'd; semi-flexed and unchylosed.
5	Albright, J., Pt., H, 100th Ill., age 27.	Sept. 19, 19, '63.	Two, right radius, lower; by Surg. A. M. McMahon, 61th O. Disch'd June 11, '64; pens'd; anchylosed wrist.	13	Appleton, B., Pt., K, 128th Indiana, age 44.	Nov. 25, 25, '64.	Five, upper, right ulna. Disch'd May 30, 1865; pens'd; use of arm impaired.
6	Allard, P., Pt., F, 17th Vermont, age 39.	May 18, 18, '64.	Right ulna, middle; by Surg. P. O. M. Edson, 17th Vt.; gang., hæm. July 30th, amp. arm. Disch'd Dec. 21, 1864; pens'd.	14	Arnold, J. M., Pt., E, 111th Illinois, age 24.	Mar. 10, 10, '65.	Portion of middle, left radius. Discharged Aug. 29, '65; pens'd; use of hand lost.
7	Allman, J., Serg't, E, 26th Wis., age 26.	June 1, 1, '64.	Six, left ulna, upper. Disch'd Apr. 20, '65; pens'd; anchylosed elbow; use of hand impaired.	15	Ashford, J. M., Pt., B, 17th Kentucky, age 22.	June 18, 19, '64.	Right ulna and radius. Oct. 1, amp. Disch'd Mar. 25, 1865.
8	Alverson, J. K., Pt., M, 7th N. Y. H.A., age 19.	June 3, 3, '64.	Three, middle, right ulna; by Surg. A. Van Devere, 66th N.Y. Disch'd May 23, 1865; pens'd; arm useless.	16	Babbitt, J. C., Lieut., K, 13th C. T., age 23.	Dec. 16, 16, '64.	Two, lower, right rad. Disch'd Jan. 10, '66; pens'd. 1873, necrosis; has never healed.
				17	Bachman, S., Pt., A, 7th Wisconsin, age 31.	May 6, 6, '64.	Two, upper, left ulna. June 3, necrosed bone excised. Disch'd May 6, 1865; pensioned; fingers contracted and useless.

the left forearm resulting from a neglected fracture, effected ossific union in the ulna by position and pressure; but failing to bring about union in the radius, with the advice and assistance of Surgeon Z. PITCHER, U. S. A., exposed the ends of the radius and sawed off each extremity with the trephine, April 18, 1842. By May 31st, there was bony union of the radius, and, on June 21, 1842, the officer returned to duty with a slightly shortened but very useful limb. (Compare also *Boston Med. and Surg. Jour.*, 1842, Vol. XXVII, p. 129.) According to F. RIED (*Die Resectionen der Knochen*, Nürnberg, 1860, S. 347), Dr. ZAHNER, some time between 1840 and 1850, resected a half inch of the diaphysis of the radius for ununited fracture, in Dr. JÆGER'S clinic, and the patient recovered with considerable deformity. LODE (II.) (*Doppelte Fractur des Radius. Nekrose des Mittelstückes. Heilung durch Resection*, in *Deutsche Klinik*, 1853, B. V, S. 102) resected, with good results, three inches of the radius in a woman, aged 28 years, for disease. Professor v. BRUNS, in 1856 (in WERNER, *Bericht über die, auf der von* BRUNS' *schen Klinik zu Tübingen vorgekommenen Resectionen*, u. s. w., in *Deutsche Klinik*, 1858, S. 89), excised three inches of the shaft of the radius for disease; the patient recovered with displacement of the hand toward radial side at an angle of 130°. Professor J. M. CARNOCHAN (*Exsection of the Entire Radius*, in *Am. Jour. Med. Sci.*, 1858, Vol. XXXV, p. 363), in the case of D. Kane, an Irish laborer, aged 20 years, with great inflammatory enlargement of the radius following a blow, extirpated the entire bone, preserving to a remarkable degree the functions of the wrist and hand. The same surgeon (*Exsection of the Lower Four-fifths of the Radius*, in *Am. Jour. Med. Sci.*, 1858, Vol. XXXVI, p. 89), in the case of Catharine Wilson, aged 31 years, removed the greater portion of the radius, greatly altered and hypertrophied by rheumatic ostitis, April 7, 1857, with end-results equally satisfactory.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
18	Bacon, H. B., Pt., K, 8th N. Y. H. A., age 34.	June 3, 4, '64.	Three, lower, left radius; gang. Disch'd April 3, 1865; pens'd; slight lig. union; hand dislo'd.
19	Bailey, B. F., Serg't, E, 25th Wisconsin, age 22.	July 22, 24, '64.	Four, right radius; by Surg. W. A. Gott, 25th Wis Duty April 22, 1865; pens'd; dislocation ulna.
20	Baker, C. J., Pt., K, 80th New York, age 20.	Dec. 1, 1, '61.	Lower half of shaft left ulna. Discharged June 23, '62; pens'd; re-enlist. Aug. 30, '64; use impaired.
21	Baker, C. W., Corp'l, K, 118th N. Y., age 22.	May 16, 16, '64.	Upper, right ulna; by Surg. H. N. Small, 10th N. H.; (wound hip.) Disch'd Feb. 27, 1865; pens'd; anchylosis forearm at 90°.
22	Baker, J. N., Pt., F, 17th Indiana, age 25.	June 24, 27, '63.	Four, middle, right radius. Discharged June 8, '64; pens'd; fingers stiff; forearm deformed.
23	Barnett, J. L., Serg't, B, 7th W. Va., age 25.	Oct. 27, 28, '64.	Three, upper, right ulna; by Surg. J. Scott, 7th W. Va. Duty May 4, 1865; pens'd; forearm useless; imperfect use of hand.
24	Barney, J. L., Corp'l, K, 6th Wisconsin, age 21.	May 5, 5, '63.	Middle and part of upper and lower third, right ulna. Disch'd Nov. 1, 1864; pens'd; forearm flexed; no rotation or extension.
25	Bartlett, T. H., Pt., H, 58th Mass., age 30.	July 30, 30, '64.	Portion of lower and middle, right ulna. Disch'd Feb. 9, '65; pens'd; no union; wrist anchylosed.
26	Barto, W. H., Pt., D, 107th N. Y., age 26.	May 26, 26, '64.	Middle, left ulna; by A. Surg. L. W. Kennedy, 123d N.Y. Disch'd June 10, 1865; pens'd; partial anchylosis elbow; part. paral.
27	Barton, P., Pt., A, 19th Mass., age 17.	May 19, 19, '64.	Two, lower, left radius; by Surg. T. Jones, 8th Penn. Res.; (amp. right forearm.) Disch'd Oct. 26, 1864; pens'd; ulna dislocated.
28	Battles, W., Corp'l, A, 102d C. T., age 33.	Dec. 9, 10, '64.	Middle, left radius. Disch'd Mar. 20, '65; pens'd; arm disabled.
29	Batten, J. R., Pt., A, 112th Illinois, age 26.	Aug. 6, 6, '64.	Two, lower, left ulna; by Surg. G. A. Collamore, 100th Ohio. Discharged May 12, 1865; pens'd; partial use of elbow and hand.
30	Bauer, M., Pt., A, 2d Michigan, age 21.	June 17, 17, '64.	Three, middle, right radius. To V. R. C. Feb. 25, '65; pens'd; deformed and seriously impaired.
31	Beech, S. R., Pt., E, 83d Penn., age 17.	May 5, 5, '64.	Three and a half, left ulna. Disc'd Jan. 12, '65; pens'd; slight use of thumb and index finger.
32	Beale, E. C., Corp'l, E, 2d N. Y. A., age 27.	July 30, 30, '64.	Three, middle, left ulna. Disch'd May 27, 1865; pens'd; much impaired. Died Jan. 9, '71.
33	Belknap, H. A., Serg't, A, 56th Penn., age 52.	June 19, 19, '64.	Three, middle, left ulna; by Surg. G. W. New, 7th Ind. Disch'd Nov. 11, 1864; pens'd; no union; elbow joint impaired.
34	Bennett, H. M., Corp'l, B, 39th Mass., age 21.	May 10, 10, '64.	Four, middle, left radius. Disc'd Jan. 7, 1865; pensioned; atrophied and entirely useless.
35	Birdsall, A. J., Corp'l, E, 2d N.Y.H.A., age 27.	Aug. 14, 15, '64.	Three, lower, r't ulna; by Surg. J.W. Buckman, 5th N.H. Dis'd. Oct. 1, 1864; pensioned; anchylosed wrist; nearly useless.
36	Bird, C., Pt., K, 103d C. T., age 21.	Dec. 9, 9, '64.	Two and a half, lower, left ulna. Disch'd April 7, '65; pensioned. Died May 5, '66, consumption.
37	Bitner, F., Pt., D, 87th Pennsylvania, age 18.	Sept. 19, 19, '64.	Portion right radius. Dis'd June 14, '65; pens'd; great deformity wrist; fing's stiff. Died May 5, '67.
38	Black, J. A., Capt., B, 56th Pa., age 36.	May 23, 23, '64.	One and a half, upper, left ulna; hæmorrhage. Disch'd July 1, '65; pens'd; elbow anchylosed.
39	*Bland, S.*, Serg't, C, 55th Virginia., aged 30.	Aug. 19, 19, '64.	Upper third, right radius. Sept. 30, recovered.
40	Blodgett, P. D., Capt., E, 10th Vt., age 36.	June 2, 3, '64.	Four, middle, left ulna; by Surg. T. A. Helwig, 87th Pa. Disch'd Nov. 25, '64; pens'd; no union; fingers extended—stiff.
41	Bonbright, D., Corp'l, E, 11th Pa., age 17.	May 8, 11, '64.	Middle, left radius. Duty Nov. 8, '64; pensioned; dislocation ulna; hand at right angle.
42	Bosworth, G. A., Serg't, D, 14th New York H. Art., age 27.	July 30, 30, '64.	One and a half, middle, right rad.; by Surg. G. W. Snow, 35th Mass. Duty Jan. 19, 1865; (necrosis;) pensioned; styloid process ulna displaced; anchylosed wrist.
43	Booze, C., Pt., H, 118th Illinois, aged 17.	Sept. 15, 15, '64.	Three and a half, lower, left rad. Dis'd Oct. 1, '65; pens'd; wrist j't distorted; hand almost useless.
44	*Bowlick, J.*, Pt., E, 14th South Carolina.	June 22, 22, '64.	Por. left ulna; by Surg. G. Chaddock, 7th Mich. Prison Oct. 4, '64.
45	Bowyer, E., Lieut. Col., 11th Mo., age 44.	Dec. 16, 16, '64.	Two, middle, left ulna; by Surg. J. E. Murta, 8th Wis. Duty Mar. 1, '65; pens'd; necrosis; partial paralysis limb.
46	Bower, R. T., Pt., C, 49th Ohio, age 34.	May 27, 30, '64.	One and a half, lower, right ulna. Disch'd Nov. 17, '64; pensioned; permanently weak and imperf't.
47	Bradley, J. W., Pt., D, 18th Ohio, age 19.	Dec. 15, 15, '64.	One and a half, radius, lower, and lig. ant. interos.; by A. A. Surg. S. W. Blackwood. Dis'd June 16, '65; pens'd; anchyl. wrist; fingers hooked; hand to one side.
48	Bradley, P., Pt., D, 8th Penn. Cav., age 19.	April 5, 5, '65.	Portion lower, left ulna. Disch'd June 29, '65; pensioned; use of hand; loss of power in arm.
49	Brandon, A., Lieut., H, 12th Illinois.	Aug. 8, 8, '64.	Three, left ulna; by Surg. J. Pogue, 66th Ill. Disch'd July 18, 1865; pensioned; head of radius dislocated; anchylosis of elbow.
50	Brewster, H. M., Lieut., I, 57th New York.	Dec. 11, 11, '62.	Six, right ulna. V.R.C. Aug. 10, 1863; pens'd; anchylosis; almost complete loss of use.
51	Briggs, C. L., Corp'l, B, 132d Penn., age 19.	May 3, 5, '63.	Five, right radius. Disch'd May 24, 1863; pensioned; distortion; no power in hand or forearm.
52	Briggs, M. M., Pt., C, 102d Ill., age 22.	May 25, 26, '64.	Two, upper, right rad.; by Surg. W. Hamilton, 102d Ill. Disch'd April 27, '65; pens'd; disloc. carpal end of ulna.
53	Briggs, S. S., Pt., H, 105th Penn., age 27.	Aug. 16, 16, '64.	Six, middle, right ulna. Disch'd June 20, '65; pens'd; anchylosed elbow and finger joints.
54	Brinton, J. B., Lieut., G, 9th Ind., age 25.	Sept. 2, 2, '64.	Three, middle, left radius; by A. Surg. W. H. Matchett, 40th O. Disch'd Dec. 19, '64; pens'd; part. anchylosed elbow; little and ring fingers flexed.

140	Decker, P., Pt., D, 112th New York, age 36.	Jan. 15, 16, '65.	Four, middle, left rad; by Surg. G. C. Jarvis, 7th Conn. Disch'd June 30, '65; pens'd; partially anchylosed elbow.
141	Dedrick, G. F., Pt., B., 61st Penn., age 19.	Nov. 5, 5, '63.	Two and three-fourths, middle, r't radius; by Surg. G. T. Stevens, 77th New York; rotation lost. Duty July 5, 1864.
142	DeLacy, W., Lieut.-Col., 164th N. Y., age 35.	May 18, 18, '64.	Two, lower, left ulna; by Surg. M. Rizer, 72d Pa.; (other wounds.) Duty Aug. 20, 1864; pens'd; anchylosed wrist.
143	Denny, F., Corp'l, K, 82d New York, age 27.	May 2, 2, '63.	Two and a half, upper, left ulna. To V. R. C. Jan. 22, '64; pens'd; bone ununited; slight impairm't.
144	Dibble, H. B., Pt., H, 23d Michigan, age 24.	May 14, 17, '64.	Three, middle, r't rad.; by Surg. D. L. Heath, 23d Mich. Disch'd Sept. 28, '64; pens'd; crooked and weak; of but little use.
145	Diefenbach, H., Lieut., I, 111th Penn., age 30.	July 20, 20, '64.	One and a half, lower, right rad.: lig. radial; by Surg. A. K. Fifield, 29th Ohio. Disch'd Nov. 3, 1864. Not a pensioner.
146	Dilley, J. B., Pt., A, 33d Ohio, age 20.	July 21, 22, '64.	One and a half, upper, left radius (fr. ulna). Duty Oct. 18, '64: pen.; wrist def med; no bony union.
147	Ditson, M. S., Corp'l, K, 2d Mass., age 24.	July 2, 2, '63.	Two, upper, left rad. Dis'd Jan. 8, '64; pens'd; partial rotation.
148	Dinsmore, J. N., Pt., B, 8th Maine, age 28.	May 20, 20, '64.	Middle, left ulna. Disch'd Nov. 30, 1864; pens'd; false joint; prehension gone.
149	Dodge, G. F., Pt., C, 6th Vermont, age 34.	Sept. 19, 19, '64.	Four, upper, left ulna. Disch'd Feb. 22, 1865; pens'd; impaired use of hand.
150	Dole, M. V., Pt., I, 104th Ohio, age 26.	Aug. 6, 6, '64.	Two, middle, left radius; by Surg. W. H. Mullens, 12th Ky. Disch'd April 3, '65; pens'd; carpal end of ulna luxated.
151	Donaldson, J. H., Pt., C, 5th Ohio, age 19.	May 27, 27, '64.	Left radius. Deserted Nov. 1, '64.
152	Donovan, M., Pt., C, 155th Penn., age 47.	May 5, 8, '64.	Two, middle, left radius; hæmor. Dis'd Mar. 11, '65; pen'd; wrist joint anchyl.; fingers contracted.
153	Donze, J., Pt., A, 8th Pa. Res., age 22.	May 8, 8, '64.	Four, middle, right ulna; by Surg. B. Rohrer, 8th Pa. Res. Disch'd Feb. 10, 1865; pens'd; limb weak and cold.
154	Drown, O., Pt., A, 11th Vermont, age 27.	June 22, 24, '64.	Large portion left radius; by Surg. C. B. Parks, 1st Vt. H. A. Discharged Dec. 20, '64; pensioned; disloc. ulna; imperfect rotation.
155	Drahmer, N., Corp'l, D, 188th N. Y., age 32.	April 1, 1, '65.	Three, middle, left ulna. Disch'd June 5, 1865; pens'd; fingers stiff.
156	*Duke, R. H.*, Pt., G, 47th Alabama.	July 2, 3, '63.	Middle third of ulna. Recovered.
157	Eaton, J., Corp'l, H, 4th N. H., age 25.	July 30, 30, '64.	Three, lower, right radius; by Surg. T. F. Oakes, 56th Mass. Discharged July 19, 1865; pensioned; wrist distorted.
158	*Eady W.*, Pt., F, 5th North Carolina.	July 3, 3, '63.	Three inches of radius. Exch'd September 5, 1863.
159	Edington, R. H., Pt., F, 6th E. Tenn., age 23.	June 16, 16, '64.	Four, lower, right ulna; by Surg. J. W. Lawton, U. S. V.; gang. Dis'd Ap. 27, '65; pen.; good use.
160	Ellis, J. B., Pt., D, 60th Ohio.	May 9, 11, '64.	Four, low. half, right ulna. Dis'd Jan. 24, '65; pens'd; wrist anchy.
161	Elser, J., Pt., D, 3d N. Jersey, age 21.	Nov. 22, 22, '64.	Right radius and ulna, middle. Discharged May 30, 1865.
162	Emmons, J. A., Pt., H, 5th Minn., age 28.	Dec. 15, 15, '64.	Left radius, mid. V. R. C. May 11, 1865; pens'd; greatly impaired.
163	Engle, G. D., Pt., 28th Mich., age 20.	March 10, 11, '65.	One and a half, lower, left rad.; by Surg. W. A. Gott, 25th Wis.; hæm.; lig. radial. Disch'd July 20, '65; pensioned; hand disloc. inward; bones ununited.
164	Ermen, J., Pt., A, 111th Pa., age 21.	June 11, 11, '64.	Two, upper, left ulna; by Surg. G. P. Oliver, 111th Pa. Disc'd May 30, '65; pen., part. anch. elb.
165	Estes, J., Pt., E, 73d Indiana, age 22.	Oct. 28, 28, '64.	Five, right radius; by Surg. G. R. Baldwin, 18th Mich. Discharged March 27, 1865.
166	Everhart, W. M., Lieut.-Col., 16th Pa. Cavalry, age 23.	April 6, 6, '65.	Three, lower, left ulna. Disch'd July 24, 1865; pensioned; ligamentous union; bones distorted.
167	Farrar, L., Pt., K, 19th Maine, age 21.	June 1, 1, '64.	Five, middle, right ulna; by Surg. D. W. Maull, 1st Del. Disch'd Apr. 29, '65; pens'd: arm weak'd.
168	Fenton, C. H., Pt., G, 162d N. Y., age 21.	June 22, 22, '64.	One-half, middle, left ulna; by Surg. G. Chaddock, 7th Mich. To V. R. C. March 28, '65; pens'd. Died June 24, '66, ch. diarrhœa.
169	Finkbone, J., Pt., C, 124th Indiana, age 45.	June 2, 3, '64.	Right radius and ulna. Aug. 1, amp. arm. Disch'd May 8, '65.
170	Fisher, R. E., Lieut., K, 5th Ohio, age 40.	July 3, 4, '63.	Upper, left radius; by Surg. A. Ball, 5th Ohio. Duty Dec. 9, '63; pens'd; hand turned inward.
171	*Fitzpatrick, J. G.*, C, 27th Georgia, age 25.	Feb. 24, 25, '64.	Portion lower third radius. Recovered.
172	Fitzsimons, J., Pt., M, 2d Conn. H. A., age 19.	Oct. 19, 19, '64.	Two and a half, middle, left ulna. Disch'd June 10, 1865; pens'd; limb useless.
173	Flynn, P., Pt., 21st Ohio Light Artillery, age 18.	June 2, 2, '64.	Upper, left radius (fr. ulna); gang. Disch'd Nov. 10, '64; pens'd; motions of elbow and flexer and extensor muscles destroyed.
174	Fogle, J. E., Pt., F, 7th Maryland, age 20.	June 1, 1, '64.	Four, upper, left ulna; flexion and supination lost. To V. R. C. Mar. 2, 1865; pens'd.
175	Foster, F. W., Lieut., G, 9th Iowa, age 24.	May 13, 13, '64.	Three, upper, right radius (fract. ulna); by Surg. A. Sabine, 76th Ohio. Disc'd Sept. 17, '64; pen'd; no rotation.
176	Fraze, W., Pt., A, 27th Kentucky, age 21.	June 26, 26, '64.	Three, middle, right radius; by Surg. S. K. Crawford, 50th Ohio. Dis'd Mar. 29, '65; pens'd; disloc. carpal end ulna; no motion hand.
177	Frisbie, W. F., Pt., A, 29th Ohio, age 31.	May 27, 28, '64.	Three, right radius, portion ulna; by Surg. A. K. Fifield, 29th Ohio. Disch'd Oct. 25, 1864; pens'd; anchylosed wrist; ulna projects.
178	Frederick, J., Pt., E, 103d Illinois, age 27.	Nov. 25, 25, '63.	Three, upper, left, both bones; necrosis; amp. arm Mar. 23, 1864. Disch'd Feb. 18, '65. *Spec.* 2206.
179	Fry, R., Pt., E, 7th Maryland, age 27.	June 1, 1, '64.	Three, middle, right radius. Discharged May 16, 1865.
180	Fuller, A. M., Lieut., K, 10th Vermont, age 28.	Oct. 19, 19, '64.	Two and a half, middle, right ulna; by Surg. G. T. Stevens, 77th N. Y. Disch'd Dec. 19, '64; pensioned; useless.
181	Fuller, L., Pt., I, 66th New York, age 19.	May 12, 12, '64.	Two, lower, left radius. Disch'd April 3, 1865; pens'd; wrist turned; little grasp.
182	Gaddis, J. F., Pt., K, 39th Illinois, age 19.	Aug. 16, 16, '64.	Three, lower, left radius; by Surg. C. M. Clark, 39th Illinois; hæm. Disch'd Aug. 7, 1865; pens'd; dislocation wrist; no bony union.
183	Gallagher, D., Pt., D, 17th Wis., age 17.	July 22, 22, '64.	Lower, right radius; by Surg. H. McKennan, 17th Wis. Disch'd July 4, '65; pens'd; hand flexed.
184	Gamble, D. C., Capt., E, 66th Illinois, age 27.	May 30, 30, '64.	Three, upper, left ulna. Disch'd July 7, '65; pens'd; lig. union.
185	Gardiner, W. H., Pt., D, 43d N. Y., age 42.	May 6, 6, '64.	Portion lower, left radius. Disc'd June 16, 1865; pens'd; impaired use. *Spec.* 2761
186	Gardner, L. L., Serg't, C, 11th Maine, age 27.	April 10, 10, '65.	Two, right ulna; by Surg. H. C. Levensaler, 8th Maine. Disch'd July 15, '65; pens'd; very weak.
187	Garey, A. J., Capt., I, 12th Mass., age 30.	May 8, 8, '64.	Four, upper, left ulna. Duty July 6, '64; pensioned; partial dislocation radius; elbow distorted.
188	*Garner, R. E.*, Pt., B, 21st Georgia.	Aug. 28, 30, '62.	Four, middle, ulna. Good use of arm.
189	Gaverick, D., Pt., A, 149th Pa., age 22.	June 1, 1, '64.	Three, middle, right radius. Dis'd Dec. 14, '64; pens'd; disloc. wrist; flexion and extension impaired.
190	Gaston, J. H., Pt., A, 97th Indiana, age 20.	June 27, 27, '64.	Two, upper, right, both bones; by Surg. R. Morris, 103d Ill. Dis'd May 10, '65; part. anchyl. elbow; no bony union: limb only ornam't.
191	Geiler, A., Pt., C, 72d Pennsylvania, age 32.	July 3, 5, '63.	Lower, right ulna; by Surg. M. Rizer, 72d Pa. Dis'd Aug. 17, '64.
192	Geelan, B., Pt., G, 49th New York, age 21.	May 12, 13, '64.	Three, lower, left ulna; by Surg. J. A. Hall, 49th N. Y. Disch'd July 25, '65; pensioned; useless.
193	Geroe, W., Pt., G, 51st New York, age 22.	June 30, 30, '64.	Part upper, right ulna. Disch'd May 30, '65; pens'd; anchylosed elb. Burned to death Dec. 29, '65.
194	Gibson, S. O., Corp'l, D, 11th N. H., age 23.	June 16, 18, '64.	Four, right radius and one inch of ulna; by Surg. J. W. Wishart, 140th Pa.; gang.; necrosis; amp. forearm. Disch'd June 2, 1865.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
195	Gilbert, H. E., Pt., F, 12th Mass., age 31.	May 10, 11, '64.	Four, middle, right ulna; erysipelas. Disch'd Sept. 26, '64; pensioned; forearm badly deformed and atrophied; no rotation.
196	Gilley, C. B., Pt., G, 1st Maine Heavy Art'y, age 23.	June 23, 23, '64.	Three, middle, left radius; by Surg. H. F. Lyster, 5th Mich. Disch'd Feb. 20, '65; pensioned; anchyl. wrist; limb soft, atroph'd.
197	Gilligan, T., Pt., H, 56th Pennsylvania, age 24.	May 12, 12, '64.	Four, lower, left radius. Disch'd May 16, 1865; pensioned; hand tremulous and useless.
198	Gingerick, W., Pt., B, 64th Illinois, age 22.	Aug. 10, 11, '64.	Three, upper, left radius. To V. R. C. May 9, 1865; pensioned; no rotation; arm weak.
199	Goodall, R. S., Serg't, F, 5th N. H., age 23.	April 7, 7, '65.	Two and a half, lower, right radius. Disch'd Sept. 12, '65; pensioned: Nov., 1865, open sore from dead bone. Died June 11, 1866.
200	Gorman, T., Corp'l, E, 183d Pa., age 25.	May 10, 10, '64.	Four, upper, left ulna. Disch'd June 13, 1865; pensioned; anchylosed elbow; hand paralyzed.
201	Grace, A. J., Pt., K, 17th Maine, age 19.	May 12, 12, '64.	Two and a half, upper, right ulna (fract. radius). Disch'd Jan. 2 1865; pens'd; cartilag. union.
202	Graham, W., Corp'l, D, 86th Illinois, age 21.	June 27, 27, '64.	Three, lower, right radius. Dis'd Feb. 6, '65; pensioned; anchylosed wrist; fingers contracted.
203	Gravell, L., Pt., I, 34th Mass., age 28.	June 18, 18, '64.	Three, lower, left radius. Disch'd March 14, '65; pensioned; ulna dislocated; hand useless.
204	Grayburn, R. W., Serg't, G, 5th Ky., age 22.	Nov. 25, 25, '63.	Four, lower, right rad.; by Surg. O. Chamberlain, 8th Kan. Duty Aug. 5, '64; pens'd; hand inverted; ulna dislocated.
205	Grayson, A., Serg't, F, 50th C. T., age 47.	April 5, 5, '65.	Four, upper, right radius. Disc'd June 1, 1865; partial loss use of arm. Not a pensioner.
206	Green, N., Pt., D, 6th Michigan Cavalry.	Sept. 14, 15, '63.	Two, lower, left rad.; gang; Nov. 3, amp. forearm; hæm.; Nov. 17, amp. arm. Dis'd March 24, 1864.
207	Greenfield, J. M., Pt., F, 7th Michigan, age 21.	May 31, 31, '64.	Lower, left ulna; by Surg. S. H. Plumb, 82d N. Y. Disch'd Dec. 13, '64; pensioned; rotation fair; moderate motion in hand.
208	Griesenger, G. W., Sergeant, K, 111th Ohio, age 27.	June 28, 28, '64.	Three, lower, right ulna; by Surg. J. W. Lawton, U. S. V. Disch'd Jan. 24, '65; pensioned; anchyl. wrist; no flex. or exten. fingers.
209	Groff, J. H., Serg't, H, 12th N. J., age 27.	May 3, 3, '63.	One and a half, lower, left radius. Duty July 30, 1864; pensioned; dislocation ulna.
210	Guild, P. M., Serg't, K, 57th Pa., age 30.	May 4, 4, '63.	Four, upper, right rad.; by Surg. H. F. Lyster, 5th Mich. Disc'd Sept. 21, '63; pensioned; no rotation; little flexion.
211	Gwin, C. A., Pt., B, 129th Illinois.	May 15, 15, '64.	Middle, right radius (fract. ulna); Oct. 18, two ins. radius rem'd. Disch'd June 6, '65; pensioned.
212	*Gwinne, A. D.*, Lieut.-Col., 38th Tennessee.	July 22, 23, '64.	Portion of ulna. Transferred.
213	*Hack, J. W.*, Lieut., E, 9th Virginia.	July 2, 2, '63.	Portion of ulna. To prison Aug. 1, 1863.
214	Hackett, G. H., Lieut., A, 10th N. Y., age 20.	May 6, 6, '64.	Four, right ulna; amp. arm for gangrene. Disc'd May 26, '65.
215	Hadley, B., Pt., F, 179th New York, age 19.	Feb. 7, 7, '65.	Portion left ulna; by Surg. L. W. Bliss, 51st N. Y. Disch'd June 10, 1865. Not a pensioner.
216	Hagan, W. J., Pt., I, 32d Wis., age 19.	March 21, 21, '65.	Three, lower, left ulna; by Surg. A. B. Monohan, 63d O. Dis. July 10, '65; pen'd; hand alm. useless.
217	Hageman, A. W., Pt., D, 103d Ill., age 23.	Nov. 25, 26, '63.	Two, middle, right ulna; by Asst. Surg. S. S. Buck, 103d Ill. Dis'd Oct. 28, '64; pensioned; lig. union; anchy. elb.; arm nearly ext'd.
218	Hall, M., Pt., F, 87th Penn., age 19.	April 2, 2, '65.	Portion left radius, middle (ulna tractured). Disch'd June 17, '65; pen'd; hand inward; fings. flex'd.
219	Hainline, J. L., Serg't, A, 16th Illinois, age 26.	Mar. 19, 19, '65.	Two, lower, left ulna. Duty June 16, '65; pens'd; imperfect use of hand.
220	*Hamilton, J. H.*, Pt., G, 18th Miss., age 26.	May 3, 3, '63.	Four inches middle third, right ulna. Recovered.
221	Hammel, W., Pt., F, 121st Ohio, age 22.	June 27, 27, '64.	Three, right ulna, upper; by Surg. T. B. Williams, 121st Ohio. Discharged Sept. 28, 1864; pens'd; fings. contracted; forearm atro'd.
222	Hammond, R. P., Pt., E, 110th Ohio, age 30.	April 2, 2, '65.	Three and a half, middle, left ulna; by Surg. R. R. McCandless 110th Ohio. Disch'd June 19, '65; pen'd: can't close fings.; elb. impaired.
223	Hamlin, J. M., Lieut., H, 36th Ohio, age 25.	June 11, 11, '64.	Five, middle, ulna; by Surg. J. W. Whitford, 36th Ohio. Duty Oct. 18, 1864.
224	Harley, A., Pt., E, 2d Penn. H. A., age 19.	July 30, 30, '64.	Four and a half, upper, left, both bones. Disch'd May 16, '65; pensioned; disloc. elb.; hand useless.
225	*Harlo, J. W.*, Pt., A, 2d Mississippi, age 21.	May 6, 6, '64.	Two, upper, radius. Furloughed June 22, 1864.
226	Harris, P. W. H., Serg't, E, 40th N. Y., age 30.	June 18, 18, '64.	Two, middle, right ulna (radius frac.); by Asst. Surg. O. J. Evans, 40th N. Y. Disch'd Mar. 14, '65; pens'd; no power to grasp.
227	Harrod, M. S., Pt., D, 45th Ohio, age 22.	June 15, 15, '64.	Two, middle, left ulna; by Surg. S. K. Crawford, 50th Ohio. Discharged May 9, '65; pensioned; limb weak, of but little use.
228	*Hartfield, J. A.*, Pt., H, 17th Mississippi, age 21.	May 3, 4, '63.	Five, lower, left radius. Furlo'd June 11, 1863; improving.
229	Hartley, M. F., Corp'l, I, 27th Illinois, age 25.	June 18, 18, '64.	Four, upper, right ulna; by Surg. S. J. Young, 79th Ill. Duty Feb. 8, 1865; pensioned; anchylosed elbow; limb impaired.
230	Harvey, W. F., Pt., G, 141st Penn., age 19.	May 6, 6, '64.	Three, middle, right ulna. Duty Nov. 26, 1864; pens'd; limb deformed and weak.
231	Hawkins, J. N., Pt., F, 40th Ill., age 21.	July 28, 29, '64.	One and a half, lower, left ulna; by Surg. W. Graham, 40th Ill. Dis. Jan. 24, 1865; pens'd; anchyl. wrist; hand practically useless.
232	Haynes, J. A., Pt., I, 11th New Hampshire.	July 12, 12, '63.	Two and a half, lower, left, both bones. Disch'd Nov. 17, '63; pensioned; ligamentous union; hand almost useless.
233	Hayes, A., Pt., I, 3d Michigan, age 30.	May 12, 13, '64.	Two, middle, right radius (ulna fractured); by Surg. H. F. Lyster, 5th Mich. Disch'd June 6, '65; pens'd; ulna dislocated; no flexion of fingers.
234	Healy, J., Pt., K, 155th New York.	June 3, 3, '64.	Right forearm; by Surg. M. Rizer, 72d Pa. Disch'd May 18, '65. Not a pensioner.
235	Heath, L. J., Pt., E, 1st Maine Cav., age 36.	Mar. 31, 31, '65.	Middle, left rad. and ulna. Disch'd June 1, 1865; pens'd; fractured ends loose in muscles.
236	Heckler, J., Corp'l, D, 14th Ohio, age 22.	Sept. 1, 1, '64.	Two, lower, right ulna; Sept. 8, accidental frac. rad. at middle. Duty June 21, '65; pens'd; part. paral. middle and ring fingers.
237	Henderson, G., Pt., C, 122d Ohio, age 19.	May 6, 6, '64.	Four, lower, left radius. Disch'd Apr. 3, '65; pens'd; wrist joint enlarged and tender.
238	Henry, W., Pt., A, 88th New York, age 31.	May 31, 31, '64.	Lower, left radius and ulna; by Surg. P. E. Hubon, 28th Mass.; gang.; amp. forearm. Dis. July 27, 1865.
239	Herrard, F., Pt., A, 6th Kansas Cavalry.	April 2, 3, '63.	Over one inch rad. and ulna; coaptation of bones. Disch'd Oct. 8, '64; complete union; rotation nearly complete. Not a pensioner.
240	Hersey, P., Pt., B, 1st Mass. H. A., age 20.	June 16, 17, '64.	Two and a half, middle, right ulna. Disch'd Dec. 19, '64; pens'd; no bony union; grasp impaired.
241	Hickman, E., Pt., C, 27th Illinois, age 22.	June 27, 27, '64.	Four, lower, left rad. Disch'd Oct. 29, '64; pens'd; hand pronated; fingers semi-flexed. Drowned July 10, 1873.
242	Hickman, W. W., Corp'l, H, 1st Del., age 22.	June 18, 18, '64.	Right ulna, upper; by Surg. D. W. Maull, 1st Del. To V. R. C. Jan. 28, '65; pens'd; rotation impaired.
243	Hicks, J. C., Pt., E, 190th Pennsylvania, age 26.	May 8, 8, '64.	Portion upper, left ulna. To V. R. C. Mar. 7, '65; pens'd; anchyl. elbow; atrophy.
244	High, L., Lieut., K, 64th Ohio.	June 18, 18, '64.	Upper, right ulna. Disch'd Apr. 4, '65; pens'd; rotation impaired.
245	Hill, J. R., Pt., 4th New York Battery.	July 3, 3, '63.	Por. left ulna; (wound of right thigh.) To V. R. C. Sept. 23, '63. Not a pensioner.
246	Hinchy, T., Pt., D, 6th N. Y. H. A., age 24.	May 20, 20, '64.	Middle, left radius. Disch'd Jan. 26, 1865; pens'd; distortion of wrist; fingers partly anchyl.
247	Hodges, B., Pt., G, 5th Connecticut, age 22.	July 20, 22, '64.	Two, middle, right ulna; Aug. 15, erysipelas; gang.; Oct. 20, amp. forearm. Disch'd Feb., 1865.
248	Hogan, M., Pt., D, 3d Maryland, age 31.	Dec. 24, 24, '64.	Two, middle, right ulna; by Surg. W. E. Johnson, 109th New York. Disch'd Aug. 7, '65; pensioned; third and fourth fingers contrac'd.
249	Hoguet, F., Lieut., E, 110th Pa., age 24.	July 2, 2, '63.	Three, middle, right radius; (w'nd hip.) Disch'd Sept. 3, '64; pens'd: anchylosis wrist; hand atrophied.
250	Holbrook, C. D., Corp'l, D, 37th Massachusetts, age 32.	May 18, 18, '64.	Two, upper half, right ulna (radius fract.); by Surg. C. Page, U. S. A. Disch'd Nov. 28, 1864. Partial motion of fingers.
251	*Holland, R. H.*, Pt., E, 6th Virginia.	July 30, 30, '64.	Middle, left ulna; by Surg. T. F. Oakes, 56th Mass. Recovered.

261	Howie, S., Pt., I, 186th New York, age 35.	April 2, 2, '65.	Two, middle, left ulna; by Asst. Surg. J. H. Kimball, 32d Maine. Disch'd June 12, 1865; pens'd; no bony union or rotation.
262	Howk, A., Pt., H, 2d Ohio Cavalry, age 22.	June 21, 21, '64.	Three, middle, left ulna. Disch'd Mar. 18, 1865; pens'd; elbow anchylosed; fingers flexed.
263	Hoy, M., Lieut., K, 10th Minn., age 28.	Dec. 16, 16, '64.	Three, middle, right radius. Dis'd Apr. 13, 1865; pens'd; rotation lost; deformity.
264	Hubbard, W. L., Serg't, D, 3d N. Y., age 28.	Jan. 15, 15, '65.	Portion lower, right radius. Dis'd June 17, 1865; pens'd; rotation lost; ulna dislocated.
265	Hubbard, W. F., Pt., D, 149th N. Y., age 18.	July 2, 4, '63.	Three, middle, right radius. Dis. June 8, 1865; pens'd; hand turned half around.
266	Hudson, C., Pt., I, 21st Connecticut, age 25.	June 16, 16, '64.	Three, upper, right ulna. Disch'd April 26, 1865; pens'd; anchylosed elbow; atrophy.
267	Huffman, J., Pt., F, 85th Pennsylvania, age 22.	Oct. 13, 13, '64.	Portion of lower half, right ulna; muscles of forearm removed. Duty Apr. 22, 1865; pens'd; use of limb impaired.
268	Hughes, J., Pt., C, 157th Pennsylvania, age 41.	Aug. 18, 18, '64.	Middle, left ulna. Disch'd Dec. 5, 1864; pens'd; elbow anchyl.; arm impaired.
269	Hull, C., Pt., L, 2d Mass. Cav., age 30.	July 31, Au. 1, '63.	Two, lower, right radius. Disch'd February 19, 1864.
270	Hull, L. C., Pt., A, 107th Illinois, age 28.	May 27, 27, '64.	Four, lower, left radius; by Surg. J. W. Lawton, U. S. V. Disch'd Jan. 8, 1865; pens'd; ulna dislocated; cannot close hand.
271	Hunt, W. L., Corp'l, F, 79th Ohio, age 20.	June 22, 22, '64.	Portion lower, radius. Disch'd Dec. 3, 1864; pens'd; ligamentous union; hand entirely useless.
272	Huntley, M., Corp'l, A, 2d Mass., age 25.	July 3, 3, '63.	Entire lower, right, both bones; by Surg. W. H. Heath, 2d Mass. Disch'd Mar. 28, '64; no union; motion of wrist and hand fair.
273	Hurd, C. W., Pt., D, 1st New York Light Artillery, age 23.	May 23, 23, '64.	Two, right ulna, upper. Disch'd Dec. 17, '64; pens'd; impaired use of forearm and hand; imperfect flexion of fingers.
274	Husky, A., Pt., E, 9th Iowa, age 21.	June 27, 27, '64.	Portion, left radius; by Surg. B. N. Bond, 27th Mo. To V. R. C. May 14, 1865. Not a pensioner.
275	Hutchinson, A. H., Pt., K, 5th Maine, age 23.	May 6, 6, '64.	Three, lower, right radius. Dis'd Dec. 2, 1864; pens'd; hand turned inw.; ulna thrown for'ard.
276	Hutchinson, J. A., Pt., H, 2d West Virginia Cavalry, age 26.	Sept. 22, 22, '64.	Upper, right ulna. Disch'd June 7, 1865; pens'd; no rotation; anchylosis elbow.
277	Hutchinson, T., Pt., F, 71st N. Y., age 29.	Nov. 2, 5, '62.	Portion lower, radius (ulna disarticulated at wrist); hæm.; Mar. 15, amp. forearm. Disch'd Jan. 20, 1863.
278	Hyland, A., Serg't, B, 2d N. Y. Pro. Cav., age 16.	Aug. 29, 30, '64.	Four, upper, left ulna; nec. bone. Disch'd Nov. 4, '65; no reproduction; elbow intact. *Spec.* 4360.
279	Ilsley, H., Pt., I, 140th New York, age 35.	Feb. 6, 6, '65.	Middle, left radius; by Surg. T. M. Flandrau, 146th N. Y.; gang.; hæm.; Feb. 25, amp. arm. Discharged July 24, 1865.
280	Irish, A. J., Pt., H, 106th New York, age 23.	May 12, 12, '64.	Middle, right radius: May 17, amp. arm; gang. Disch'd June 3, 1865; pensioned.
281	Jackson, L., Corp'l, G, 124th Illinois, age 24.	May 16, 16, '63.	Two, lower, right radius; by Surg. E. J. Buck, 18th Wis. Disch'd Nov. 9, 1863; pensioned; hand at a right angle; ulna disloc.
282	Jennings, W. H., Pt., G, 43d Ohio, age 27.	Feb. 3, 3, '65.	Portion of right radius; by Surg. F. M. Rose, 43d Ohio. Disch'd July 20, '65; pens'd; disloc. ulna.
283	Jerue, G., Pt., I, 5th Iowa Cav., age 35.	Nov. 25, 25, '63.	Left ulna (radius fractured); by A. Surg. W. H. Darrow, 5th Iowa. Disc'd June 27, '65; pen'd; uses a supporter constantly.
284	Johnson, A., Pt., H, 1st Illinois Artillery, age 35.	July 22, 22, '64.	Middle, right ulna; by Surg. S. P. Bonner, 47th Ohio. Disch'd June 19, 1865; pensioned; partial anchylosis of elbow.
285	Johnson, B. S., Pt., F, 141st N. Y., age 42.	May 15, 15, '64.	One and a half, middle, right radius (fract. ulna); by Surg. A. K. Fifield, 29th Ohio. Disch'd June 24, 1865; pens'd; false joint; ulna dislocated.
286	*Johnson, R. D.*, Serg't, I, 59th Va., age 25.	July 30, 30, '64.	Two inches, lower third, left radius.
287	Johnston, J., Pt., E, 60th Ohio, age 35.	June 24, 24, '64.	Middle, right radius; by Surg. C. E. Ames, 60th Ohio. Duty Mar. 11, 1865. Not a pensioner.
288	Jones, J., Pt., F, 115th Illinois.	Sept. 19, 19, '63.	Three, lower, radius. Disc'd June 11, '65; pens'd; ulna dislocated at wrist; hand bent.
289	Jones, R., Pt., C, 43d Colored Troops, age 19.	Oct. 27, 27, '64.	Left ulna; by A. Surg. M. Tucker, 39th C. T. Disch'd June 8, 1865; claim pending.
290	Justin, F., Pt., H, 31st Maine.	June 3, 3, '64.	Left forearm; June 9, amp. forearm. Disch'd Jan. 5, 1865.
291	Kantz, L., Pt., H, 1st Pennsylvania Rifles, age 32.	May 6, 6, '64.	Two, lower, right ulna; (May 20, amp. left forearm.) Disc'd June 1, 1865; rotation and muscular functions lost.
292	Keith, E. R., Pt., K, 149th N. Y., age 23.	June 16, 16, '64.	Two and a half, lower, left ulna; by Surg. J. N. Kendall, 149th N. Y. June 29, gang. Dis. May 17, '65; pen'd; limb alm. useless.
293	Kelley, J., Pt., F, 2d Cavalry, age 28.	June 11, 11, '64.	Portion upper, right radius; part'l anchylosis elbow. Disch'd Dec. 13, '64; pensioned; rotation lost.
294	Kent, D. H., Capt., 4th Delaware, age 28.	Feb. 5, 5, '65.	Three, upper, right ulna; by Surg. H. Bendoll, 86th N. Y. Disch'd May 10, 1865; pensioned; use greatly impaired.
295	Kent, J., Pt., D, 30th Illinois, age 23.	July 22, 22, '64.	Left ulna; Aug. 24, amp. arm. Disch'd May 15, '65; pensioned.
296	Kernberger, F., Pt., K, 50th Mass., age 18.	June 27, 27, '64.	Three, middle, right radius. Discharged Dec. 8, '64; pensioned; no union; hand almost useless.
297	Kiefer, J., Pt., F, 73d New York.	Sept. 25, 25, '64.	Right ulna. Discharged June 10, 1865. Not a pensioner.
298	Kiernan, M., Pt., F, 2d Rhode Island, age 19.	May 6, 6, '64.	Two, middle, left radius. To V. R. C. Nov. 30, '64; pensioned; rotation nearly lost; impaired use.
299	Kirkhaven, A., Pt., F, 1st Md. Cav., age 27.	Aug. 16, 16, '64.	Three, lower, left radius. Disc'd Dec. 31, '64; pensioned; carpal end of ulna protrudes; distortion.
300	Kitson, A., Pt., E, 148th New York, age 36.	Mar. 30, April 1, 1865.	Three, lower, left ulna; fracture radius. Dis'd July 22, '65; pen'd; hand and forearm nearly useless.
301	Klaus, F., Pt., C, 17th Missouri, age 25.	Nov. 27, 27, '63.	Two, left radius, upper. Disch'd May 14, '64; pen.; part. anch. elb.
302	Kromes, G., Pt., E, 96th Pennsylvania, age 21.	May 10, 10, '64.	Two, lower, left radius. Disch'd July 20, 1865; pensioned; deformity at wrist; arm useless.
303	Lahr, P., Pt., M, 7th Michigan Cavalry.	Oct. 1, 1, '63.	Three, middle, ulna. Discharged July 12, 1865; pensioned; non-union; head of radius dislocated.
304	Landon, J., Pt., B, 32d Massachusetts, age 27.	Feb. 6, 6, '65.	One, middle, left ulna. Disch'd July 17, '65; pensioned; anchyl. and disloc. elbow; hand deform.
305	*Langford, J. W.*, Pt., F, 15th Alabama.	May 6, 6, '64.	Three, lower third, radius; erysipelas. Recovered.
306	Lane, G., Pt., K, 4th Iowa, age 26.	May 27, 27, '64.	Three, lower, right rad.; by Surg. N. W. Robbins, 4th Ia. Disch'd March 8, 1865; pensioned; wrist joint anchylosed; hand flexed.
307	Lane, R. R., Pt., G, 32d Missouri, age 29.	July 28, 28, '64.	Two, lower, left ulna; by Surg. A. T. Hudson, 26th Iowa. Disch'd Nov. 30, '64; pensioned; fingers contracted; partial paral. arm.
308	Lanham, S. M., Pt., D, 8th Kansas, age 16.	July 24, 25, '64.	Right radius, middle (fract. ulna); gangrene. Duty April 19, '65; pensioned; fingers impaired.
309	Larwood, J. J., Pt., C, 8th New York H. Art., age 18.	June 3, 3, '64.	Two, lower, left radius (ulna fractured). Disch'd May 31, 1865; pensioned; hand dislocated; fingers extended.
310	Lathrop, J. R., Pt., C, 15th Iowa, age 19.	July 22, 25, '64.	Three, left radius and ulna; by Surg. W. H. Gibbon, 15th Iowa. Disch'd June 14, '65; pen'd; hand can be partly closed; arm crook'd.
311	Leavitt, D. W., Pt., C, 32d Missouri, age 30.	May 12, 12, '64.	Three, lower, right ulna; by Surg. J. S. Ross, 11th N. H. To V. R. C. Feb. 22, 1865; pensioned; useful for light labor.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
312	Leach, R. M., Pt., F, 12th Mass., age 29.	May 5, 5, '64.	Four, middle, right ulna. Disch'd June 29, 1865; anchylosis elbow; grasp impaired.
313	Leeti, G. W., Mus'n, H, 191st Pa., age 21.	June 17, 17, '64.	Excision; by Surg. W. Lyons, 11th Pa. Res. Disch'd April 24, 1865. *Spec.* 4111. See CASE 1889.
314	Le Large, V., Pt., I, 28th Mass, age 32.	May 6, 7, '64.	Two and a half, lower, left ulna; by Surg. P. E. Hubon, 28th Mass. Disch'd July 21, '65; pensioned; anchyl. wrist; impaired power.
315	Lemmon, A., Capt., B, 69th Ohio, age 22.	Nov. 25, 25, '63.	Right radius, lower. Disch'd July 17, '65; pens'd; paralysis of hand. Died Sept. 5, 1867, jaundice.
316	Lenhart, E., Corp'l, D, 48th Pa., age 24.	May 12, 12, '64.	Two, upper, left ulna; by Surg. J. Harris, 7th R. I. Discharged Dec. 20, 1864; pens'd; anchyl. elbow; fingers do not flex.
317	Levingston, L., Pt., A, 103d Illinois, age 28.	June 27, 27, '64.	Two, lower, right radius and ulna. Disch'd Jan. 8, 1865; pensioned; no bony union; hand powerless.
318	Lewis, E. E., Lieut.-Col., 116th Pa., age 25.	June 16, 16, '64.	Six, left radius. Disch'd Jan. 11, 1865; pens'd; wrist deformed; styloid process prom't; necrosis.
319	Light, L., Pt., A, 149th New York, age 21.	June 15, 15, '64.	Three and a half, middle, left ulna. To V. R. C. Sept. 8, 64; pens'd; paralysis and atrophy uhar side; vicious and adherent cicatrix.
320	*Lindsey, S.* D., Pt., K, 47th Alabama, age 26.	Oct. 7, 8, '64.	Four and a half, middle, right ulna; hæm rrh.; lig. ulnar. Retired Jan. 7, '65; limb impaired.
321	Lippincott, I. P., Corp'l, B, 95th Pennsylvania, age 26.	Aug. 21, 21, '64.	Three, middle, right ulna; hæm. from traumatic aneurism; amp. arm. Disch'd March 19, 1865.
322	Listy, J., Pt., K, 5th Wisconsin, age 22.	April 2, 2, '65.	Three, middle right radius. Dis'd July 12, 1865; pensioned; hand drawn inward; ulna dislocated.
323	Little, J. H., Serg't, I, 32d Maine, age 32.	June 4, 4, '64.	Three, lower, right ulna; by A. A. Surg. J. A. McArthur; lig. brachial. June 14. Duty Jan. 26, 1865; pensioned; anchylosis elb.; fingers permanently ext'd.
324	Locker, C. B., Serg't, D, 8th New York H. Art., age 25.	June 3, 3, 64.	Two lower, right radius, by Surg. C. H. Pegg, 8th N. Y. H. A. Dis. Oct. 6, '64; no union; dislocation of ulna.
325	Louder, J., Pt., E, 123d Ohio, age 30.	Mar. 31, 31, '65.	Two, right radius and ulna (ext. ball near elbow); by Surg. F. S. Ainsworth, U. S. V. Disch'd July 10, '65; pens'd; elbow joint anchylosed.
326	Long, G. H., Lieut., H, 20th Massachusetts.	June 3, 3, '64.	Three, middle, right ulna; no rotation; limb deformed and useless. Disch'd Oct. 11, '64; pens'd.

427	Reed, T. A., Pt., D, 45th Ohio, age 20.	Aug. 21, 22, '64.	Three, middle, left radius; by A. A. Surg. W. B. Trull. Disch'd May 18, 1865; pensioned; stiffness of wrist.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
428	Reigle, D., Pt., E, 78th New York, age 31.	July 2, 2, '63.	Two and a half, right radius; by Surg. A. K. Fifield, 2d Ohio. To V. R. C. Oct. 14, 1863. Dis'd Jan. 31, 1865; pensioned; rotation lost; wrist joint displaced.
429	Reese, J., Pt., K, 101st Ohio, age 25.	May 19, 19, '64.	One and a half, lower, left radius; by Surg. C. J. Walton, 21st Ky. To V. R. C. Dec. 17, '64; pens'd: no bony union; dislocation ulna.
430	Reton, W. S., Pt., A, 176th N. Y., age 42.	May 25, 25, '64.	Two, right radius. To V. R. C. March 3, '65; pensioned; hand turned backward; ulna projects.
431	Rice, Z. M., Pt., A, 60th Ohio, age 30.	May 11, 11, '64.	Three, lower half, left ulna. Discharged Feb. 4, '65; pensioned; ligament. union; use impaired.
432	Rich, T., Pt., A, 8th Wisconsin, age 32.	Dec. 15, 16, '64.	Portion lower, right radius; by Surg. J. E. Murta, 8th Wis. Discharged March 22, 1865; pensioned; entirely useless.
433	Richards, E. F., Capt., D, 5th N. Y., age 25.	June 4, 4, '64.	Portion, middle, right ulna; by Surg. S. H. Plumb, 82d N. Y. Disch'd Nov. 2, 1864; pensioned; no rotation; numbness of hand.
434	Richardson, C. A., Corp'l, K, 23d Mich., age 21.	June 9, 10, '64.	Two and a half, middle, left rad; by Surg. D. L. Heath, 23d Mich. Disch'd April 18, '65; pensioned; no union; dislocation of wrist.
435	Riesby, R. W., Capt., A, 2d Mich., age 31.	June 25, 25, '64.	Two, lower, left radius. Disch'd Dec. 14, '64; pensioned; ulna dislocated; hand numb and useless.
436	Rickey, J. M., Pt., F, 53d Ohio, age 21.	May 29, 29, '64.	Two and a half, lower, right rad. Disch'd May 30, '65; pensioned; hand dislocated inward; limb entirely useless.
437	Riley, B. S., Pt., B, 23d Pennsylvania, age 23.	Sept. 19, 19, '64.	Lower, right ulna. Disch'd May 16, 1865. Not a pensioner.
438	Riser, B. W., Pt., H, 1st Maryland Cav., age 23.	Aug. 16, 16, '64.	Portion, lower, left radius (wound right arm). Disch'd Dec. 8, '64; pensioned; no rotation; use fair.
439	Roach, J., Pt., H, 15th Massachusetts, age 20.	May 5, 5, '64.	Three, upper, left ulna. Disch'd June 15, 1865; pensioned; head of radius dislocated.
440	Roberts, J., Corp'l, F, 143d Pa., age 38.	June 18, 18, '64.	Three, lower, left ulna. Disch'd Jan. 16, 1865; pensioned; anchyl. elbow; use impaired.
441	Rockwell, S. G., Pt., K, 14th New York Heavy Artillery, age 26.	May 12, 12, '64.	Five, middle, left radius. Disch'd Jan. 16, '65; pens'd; anchyl. wrist; cannot flex or extend fingers.
442	Rood, E., Pt., M, 3d Wis., age 21.	May 3, 3, '63.	Upper, left radius; by Surg. W. H. Twiford, 27th Indiana. Duty Mar. 20, 1864; pensioned; can flex and partially rotate arm.
443	Rooney, J., Pt., C, 3d Pennsylvania Heavy Artillery, age 20.	Nov. 8, 8, '64.	Two, lower, left radius; Nov. 26, amp. forearm. Disch'd August 26, 1865.
444	Ross, J., Pt., I, 6th Connecticut, age 23.	June 16, 16, '64.	Right ulna; erysipelas. June 29, amputation arm. Discharged December 29, 1864; pensioned.
445	Rudes, G. T., Pt., I, 2d N. Y. H. A., age 25.	May 19, 22, '64.	One and a half, middle, left rad. To V. R. C. Oct. 19, '64; pens'd.
446	Ruge, H., Serg't, B, 3d Missouri, age 28.	Nov. 27, 27, '63.	Four, upper, left radius; by Surg. E. J. McGoorisk, 9th Iowa. Disch'd Sept. 3, '64; pensioned; atrophy; anchyl. wrist; no grasp.
447	Rulison, C. E., Corp'l, F, 2d Mich., age 20.	Nov. 29, 29, '63.	Three, left radius; by Surg. G. B. Coggswell, 20th Mass. Duty April 5, '64; pens'd; rotation lost.
448	Ryan, P., Pt., B, 23d Illinois, age 41.	July 24, 25, '64.	Middle, left ulna (wound of left shoulder) Disch'd June 12, '65; pens'd; useless for manual labor.
449	*S——, E. L.*, Lieut., D, 9th Alabama.	Primary.	Left, radius and ulna; by Surg. H. A. Minor, 9th Ala. No bony union; use fair; has broken arm at seat of resection.
450	Samson, H. J., Pt., K, 2d N. Y. H. A., age 18.	June 16, 16, '64.	Portion upper half, left radius (ulna fract.); by Surg. P. E. Hubon, 28th Mass. July 22d, fragments and ends of rad. rem. Disch'd June 20, '65; pens'd; rad. and ulna anchylosed.
451	Sanbrook, G. T., Pt., K, 93d N. Y., age 26.	May 6, 6, '64.	Four, middle, right rad.; by Surg. J. J. Comfort, 1st Penn. Disch'd Feb. 16, '65; pens'd; distortion of wrist; no grasp in hand.
452	Sattezahn, J., Pt., H, 5th Penn., age 32.	May 6, 6, '64.	One-half inch, middle right ulna. Discharged.
453	Saur, L., Pt., G, 6th Mich. Cav., age 19.	May 28, 28, '64.	Four, middle, right rad. Disch'd Feb. 7, 1865; pens'd; palm turned backward and outward.
454	Sayer, A. C., Serg't, G, 93d Ohio, age 32.	Dec. 16, 16, '64.	Two, upper, right ulna; by Surg. J. M. Weaver, 93d Ohio. Dec. 25th, haem.: gang. Dis'd May 30, '65; part. anchyl. elb.; pen'd.
455	Scanlin, J., Serg't, H, 5th Wis., age 27.	May 12, 12, '64.	Three, lower, right ulna (wound of chest). Disch'd June 26, '65; pens'd; loss of use of hand.
456	Schmal, G., Pt., H, 26th Wis., age 23.	Mar. 16, 16, '65.	Portion upper, right ulna (injury to astragalus). Discharged Oct. 21, '65; pens'd; motion impaired.
457	Schmetzer, C., Pt., A, 2d Ohio Cav., age 34.	June 4, 4, '64.	Two and a half, middle, right rad. Disch'd May 16, '65; pens'd; hand turned in; fingers stiff.
458	Scott, J., Pt., A, 7th Maine, age 18.	June 3, 3, '64.	Two and a half, lower, left rad.; by Surg. G. T. Stevens, 77th N. Y. Disch'd Feb. 16, '65; hand bent inward and useless.
459	Scott, J., Pt., D, 145th Penn., age 19.	July 2, 4, '63.	Three, middle, left radius. Dis'd Jan. 7, 1864; pens'd; carpal end ulna dislocated; hand useless.
460	Scott, R., Pt., E, 28th Penn., age 19.	June 18, 18, '64.	Two, middle, left rad. (ulna fract.); by Surg. J. L. Dunn, 105th Pa. Duty Feb. 13, '65; pen'd; partial false joint; deformity.
461	Sexton, C. W., Serg't, I, 2d N. Y. Cav.	June 19, 19, '63.	Middle, right rad. (w'd of shoulder). To V. R. C. Oct. 25, '63; pens'd; hand dislocated.
462	Shaw, J. J., Pt., G, 16th Wis., age 41.	Aug. 13, 13, '64.	Two, middle, right ulna. Disch'd May 30, 1865; pens'd; loss of supination; imp. flexion of arm.
463	Shearer W. D., Corp'l, B, 55th Penn., age 23.	May 15, 15, '64.	Right radius and ulna. Dis'd Feb. 27, '65; pens'd; of little use. Died May 1, 1872.
464	Sheldon, H., Pt., D, 7th Iowa, age 18.	Aug. 30, 30, '64.	Upper, left radius; by Surg. J. Pogue, 66th Ill. To V. R. C. Not a pensioner.
465	Shemelia, P., Pt., I, 4th New Jersey, age 26.	May 12, 12, '64.	Two, middle, right radius. To V. R. C. May 17, 65; claim for pension rejected; no disability.
466	Shellabarger, W., Capt., A, 110th Ohio, age 23.	April 2, 2, '65.	Three, lower, left ulna. Duty May 25, 1865; pensioned; loss of use of hand.
467	Sherriff, L., Pt., K, 1st Massachusetts Artillery, age 25.	Dec. 13, 13, '62.	Four, right ulna, upper. Disch'd Feb. 11, '63; pens'd; radius dislocated; atrophy and weakness.
468	Shilson, C., Pt., C, 10th Minnesota, age 28.	Mar. 31, 31, '65.	Two, lower, left ulna; by A. Surg. T. H. Mulligan, 10th Minn. Discharged June 28, 1865; pens'd; rotation at wrist impaired.
469	Shoemaker, J., Pt., D, 1st New York Artillery.	May 5, 5, '64.	Five, upper, right ulna; by Surg. W. S. Thompson, U. S. V. Duty Aug. 19, 1864; pens'd; (1873) exfoliating; fingers contracted.
470	Sigman, H. M., Pt., D, 55th Pennsylvania, age 27.	May 23, 23, '64.	Two and a half, right ulna; by Surg. H. F. Lyster, 5th Mich. Disch'd July 1, 1865; pens'd; no bony union.
471	Silvins L., Corp'l, B, 143d Pennsylvania, age 35.	June 2, 3, '64.	Three, middle, left radius. Discharged Jan. 26, '65; pens'd; dislocated ulna; distortion; useless.
472	Simmons, C., Pt., C, 32d Indiana, age 21.	May 27, 27, '61.	Four, upper, right radius. Disch'd Nov. 23, 1864; pens'd; atrophy.
473	Slevin, P. S., Col., 100th Ohio, age 49.	Aug. 6, 6, '64.	Two, lower, left ulna; by Surg. G. A. Collamore, 100th Ohio. Discharged Nov. 30, 1864; pensioned; anchylosis of wrist.
474	Sloan, P., Pt., B, 169th New York, age 29.	July 4, 1864.	Six, lower, right radius. Disch'd May 29, '65; pens'd; limb greatly deformed and entirely useless.
475	Smith, C., Pt., F, 29th Colored Troops, age 17.	August, 1864.	Two, lower, right radius. Disch'd Jan. 7, 1865. Not a pensioner.
476	Smith, C. P., Pt., K, 55th Ohio, age 19.	Aug. 5, 5, '64.	Four, upper, left radius (ulna fractured). Disc'd Feb. 4, '65; pens'd; dislocation and anchylosis of wrist.
477	Smith, G., Pt., A, 157th Pennsylvania.	October, 1864.	One, left radius; by Surg. T. M. Flandran, 146th N. Y. Disch'd
478	Smith, J., Pt., E, 20th Massachusetts, age 23.	May 31, 31, '64.	Two and a half, upper, left radius; by Surg. N. Hayward, 20th Mass. Duty Jan. 31, 1865; pensioned; atrophy.
479	Smith, J., Pt., 4th Ohio.	May 10, 10, '61.	Two, ulna; by Surg. G. W. McCune, 14th Indiana. Recovery.
480	Smith, J., Serg't, K, 26th Illinois, age 27.	Mar. 19, 19, '65.	Two, lower, left ulna; by Surg. A. Sabine, 76th Ohio. Disch'd July 29, 1865; pensioned; partial ligamentous union.
481	Smith, J., Pt., I, 14th Michigan, age 26.	July 5, 6, '64.	Two, upper, right ulna; gangrene. Discharged May 17, 1865; pensioned; fingers rigid and stiff.
482	Smith, J. C., Pt., B, 1st Pa. Rifles, age 19.	May 30, 30, '64.	Two, right radius, lower. Disc'd June 11, 1864; pensioned; hand at right angle; disabled.
483	Smith, M. B., Pt., F, 16th Maine, age 18.	Aug. 18, 20, '64.	Lower, right radius; by Surg. W. Thorndike, 30th Mass. Disch'd Feb. 27, '65; pens'd; disloc. ulna
484	Smith, N., Pt., A, 151st New York, age 21.	Oct. 19, 19, '61.	Four, upper, right ulna; by Surg. J. R. Cotes, 151st N. Y. To V. R. C. May 8, 1865; pensioned; fingers flexed; adhesion muscles.
485	Smith, O. D., Corp'l, E, 30th Ohio, age 20.	June 27, 27, '64.	Three, lower, left ulna; by Asst. Surg. C. B. Richards, 30th O; gangrene; Aug. 16th, amp. arm. Disch'd April 17, 1865.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
486	Smith, S. R., Lieut., H. 33d N. J., age 37.	May 8, 8, '64.	Three, lower, left radius: by Surg. J. Reily, 33d N.J. Duty Oct.21, 1864; pens'd; hand useless.
487	Smock, S. J., Serg't, A, 70th Indiana, age 31.	July 20, 20, '64.	Three, upper half, left ulna. Discharged Oct. 31, '64; pensioned; gingiymoid motion elbow slight; imperfect use of fingers.
488	Sneider, J. N., Serg't, E. 14th Indiana.	May 3, 5, '63.	Upper, right ulna. Disch'd June 16, '64; pens'd; Feb., '64, no new bone; necrosis; open ulcer.
489	Snook, F. M., Pt., G, 14th Ohio, age 18.	Sept. 1, 3, '64.	Two, lower, right ulna: gangrene. Discharged June 15, 1865; pensioned; equal to loss of hand.
490	Snyder, W., Serg't, D, 15th Indiana, age 30.	Nov. 25, 27, '63.	Three, middle, left ulna; by Surg. A. M. McMahon, U. S. V. Dis'd May 7, 1864; pensioned; little motion in elbow.
491	Sourbeer, J., Pt., B, 45th Pa., age 24.	June 3, 3, '64.	Four, lower, left radius. Disch'd April 17, '65; pensioned; wrist and fingers anchylosed.
492	Sparks, T. B., Serg't, G. 29th Missouri.	Feb. 15, 15, '65.	Four, right ulna; by Surg. A. Sabine, 76th Ohio. Duty May 5, 1865. Not a pensioner.
493	Spare, G. A., Pt., G, 1st Pa. Res., age 31.	May 30, 30, '64.	Portion lower, left ulna. Disch'd June 13, '64; pensioned; adherent cicatrix; hand impaired.
494	Sparling, J. S., Pt., I, 20th Ohio, age 20.	July 22, 22, '64.	Four, lower, right radius. Disc'd Mar. 24, 1865; pensioned; hand paralyzed and turned inward.
495	Spector, S., Pt., B, 57th Pennsylvania.	May 12, 12, '64.	Middle, right radius; by Surg. H. F. Lyster, 5th Mich. Not a pensioner.
496	Speicher, J., Pt., C, 149th Pennsylvania, age 25.	Aug. 1, 1, 64.	Upper, right radius; gangrene; amputation arm Aug. 5th. Discharged Feb 23, '65; pensioned.
497	Spencer, C., Pt., G, 23d Indiana.	May 12, 12, '63.	Three, middle, radius. Disch'd Nov.30, 1863; pensioned; anchyl. of fingers and wrist joint.
498	Spencer, N. B., Pt., C, 13th Ohio Cav., age 30.	Sept. 30, Oct. 1, 1864.	Two, middle, left radius. Disch'd May 27, 1865; pensioned; disloc. of ulna; free motion of fingers.
499	Spofford, G. S., Pt., I, 1st Vermont Cavalry, age 21.	July 13, 14, '63.	Three, lower half, left radius. To V. R. C. Mar. 30, 1864; pens'd; dislocation of wrist; no rotation.
500	Sprague, A., Pt., H, 57th Mass., age 34.	June 26, 26, '64.	Three, upper, right ulna. Disch'd July 22, 1865; pensioned; no power in hand or forearm.
501	Staines, A., Serg't, I, 33d Maine, age 32.	June 6, 6, '64.	Middle, right radius. Discharged Feb. 9, 1865; pensioned; hand almost useless.
502	Stebbins, P., Pt., K. 122d N. Y., age 23.	Sept. 19, 19, '64.	Six, lower, right ulna; by Surg. G. T. Stevens, 77th New York. Disch'd June 1, 1865; pensioned; atrophied and useless.
503	Stepp, W. T., Pt., H, 13th Indiana, age 22.	June 1, 1, '64.	Portion lower, left radius; by Surg. D. Merritt, 55th Pa. Dis'd Sept. 5, 1865; pensioned; wrist very crooked, fingers partly stiff.
504	Stetson, O., Pt., B, 32d Maine, age 18.	June 1, 1, '64.	Three, left radius. Disch'd June 3, '65; pensioned; anchylosis of wrist; ulna projects; re-enlisted.
505	Stevens, W., Serg't, D, 11th N. H., age 22.	July 30, 30, '64.	Two, lower, right ulna. Disch'd June 5, 1865; pensioned; partial exten'n and good flex'n of fingers.
506	Stevenson, G. W., Pt., H, 78th Ohio.	July 22, 22, '64.	Right ulna, lower. Disch'd July 11, 1865; pensioned; partial anchylosis wrist; general atrophy.
507	Stevenson, J., Pt., K, 8th Pa. Cav., age 44.	May 5, 8, '64.	Three, middle, left ulna. To V. R. C. Jan. 7, '65. Not a pensioner.
508	Stokes, J., Pt., C, 78th Ohio.	July 22, 22, '64.	Lower, left ulna (fract. of radius); by Surg. H. McKennan, 17th Wis. Disch'd Mar. 15, '65; pen'd; anchyl. wrist; fingers contracted.
509	Stoner, E. C., Serg't, G, 22d C. T., age 30.	Sept. 29, 1864.	Four, lower, left radius. Duty Jan. 12, '65; pens'd; anchylosis and dislocation of ulna at wrist.
510	Stortz, W., Pt., C, 11th Conn., age 26.	June 18, 18, '64.	Three, right ulna; by Surg. G. T. Stevens, 77th N. Y. To V. R. C April 25, 1865. Not a pensioner.
511	Stouch, G. W. H., Serg't Maj. 11th Infantry.	July 2, 3, '63.	One and a half, lower, left radius. Duty Jan. 6, '64. Not a pensioner.
512	Strout, J. A., Corp'l, L, 31st Maine, age 38.	April 2, 2, '65.	Two, middle, left radius; erysip. Disch'd June 23, 1865; pens'd; hand turned inw'd; fings ext'd.
513	Stumbaugh, J., Corp'l, K, 12th Ind., age 46.	June 15, 15, '64.	Four, middle, right rad.; by Surg. J. H. Rodgers, 104th Ohio. Duty Sept. 18, '64; pen'd; hand useless.
514	Sullivan, J., Pt., F, 23d Ill., age 35.	July 7, 7, '64.	Three, middle, left ulna. To V. R. C. Mar. 2, '65; pensioned.
515	Sullivan, J., Pt., D, 59th New York.	June 18, 18, '64.	Portion, left ulna; by Surg. S. H. Plumb, 82d N. Y.; pens'd; rotation impaired.
516	Swanton, J., Corp'l, A, 145th Penn., age 22.	June 16, 16, '64.	Three, lower, right rad.; by Surg. G. L. Potter, 145th Penn. To V. R. C. Mar. 2, '65; pens'd; hand disloc. and hangs useless.
517	Sweeny, T., Pt., C, 111th New York, age 36.	Mar. 31, Apr. 1, 1865.	Two, lower, left rad. Disch'd July 26, 1865; pens'd; little use of arm, none of hand.
518	Sweeny, W., Pt., C, 48th Penn.	July 7, 7, '64.	Portion of ulna. Court-martialed and discharged.
519	Swords, J. W., Serg't, H, 26th Iowa, age 48.	Mar. 20, 20, '65.	Left rad.; lig. artery. Disch'd June 6, '65; wrist j't weakened.
520	Talbot, W. H., Pt., L, 1st Maine H. A.	May 20, 20, '64.	Two and a half, right ulna; by Surg. H. F. Lyster, 5th Mich. Disch'd March 20, 1865; pens'd; muscular power of arm nearly destroyed.
521	Tate, W., Pt., B, 111th Ill., age 21.	Dec. 13, 13, '64.	Two and a half, middle, right ulna; by Act. Staff Surg. C. B. Richards. Disch'd June 6, 1865; pens'd; good serviceable arm.
522	Tennant, G., Pt., D, 2d Maryland.	Oct. 1, 1, '64.	Left ulna; by Surg. J. E. Beatty, 2d Md. Disch'd July 17, 1865; pens'd; adherent cicatrices.
523	Thomas, J. H., Pt., D, 31st Maine, age 25.	July 2, 2, '64.	Middle, right radius. Duty Nov. 17, 1864; pens'd; limited rotation; partly anchylosed.
524	Thomen, A., Pt., D, 35th N. Y., age 32.	Apr. 16, 16, '63.	Five, middle, left radius in thirty-six fragments. Disch'd Aug. 5, '63; pens'd; ulna projects.
525	Thompson, J., Serg't, I, 61st Penn., age 21.	Sept. 19, 19, '64.	Three, middle, r't ulna; by Surg. G. T. Stevens, 77th N. Y. Dis'd June 13, '65; pen'd; cont. fingers.
526	Till, H., Pt., D, 28th Penn., age 27.	Nov. 27, 29, '63.	Portion, left radius. Disch'd September, 1861.
527	Tindall, W. W., Serg't, H, 116th Ill.	July 22, 22, '64.	Right radius, middle; by Surg. S. P. Bonner, 47th Ohio. Disch'd Dec. 19, 1864; pen'd; hand turned inward and paralyzed. Died Apr. 29, 1872, tuberculosis.
528	Tirrell, C. B., Lieut., A, 1st Minn., age 27.	June 18, 18, '64.	Four, upper half, left radius and ulna; by Surg. S. H. Plumb, 82d N. Y.; part. anchyl. elbow. Disch'd Dec. 19, 1864. Not a pensioner.
529	Titus, E., Capt., I, 6th New York Cavalry, age 24.	Sept. 19, 19, '64.	Two, middle, right ulna. Disch'd Jan. 16, '65; pens'd; some anchyl. elb.; thumb and forefinger paral.
530	Tompkins, D., Pt., E, 1st N. Y. Drag., age 19.	May 30, 31, '64.	Two, left ulna. Disch'd Nov. 18, 1864. Not a pensioner.
531	Tower, M., Pt., C, 1st Massachusetts Heavy Artillery, age 18.	May 18, 20, '64.	Three, left ulna; by Surg. H. F. Lyster, 5th Mich. Disch'd Nov. 20, 1864; pensioned; flexion and extension of hand imperfect.
532	Tridteman, J., Pt., H, 12th Missouri, age 21.	June 15, 15, '64.	Two and a half, upper, left radius; by Surg. B. N. Bond, 27th Mo. Duty Jan. 27, '65. Not a pens'r.
533	Trisket, L., Pt., A, 129th Illinois, age 19.	Aug. 6, 7, '64.	Three, upper, left ulna; by Surg. L. A. Brewer, 111th Ohio; gangrene. Duty Dec. 14, '64; pens'd; adherent cicatrix; no rotation.
534	Trowville, P., Pt., K, 11th Vermont, age 20.	Oct. 19, 19, '64.	Three, upper, right ulna (radius grazed). Dis'd Feb. 6, '65; pens'd; anchyl. elbow; no bony union.
535	Trover, J. C., Pt., D, 109th Pa., age 19.	June 15, 15, '64.	Three, middle, right radius; by Surg. J. L. Dunn, 109th Pa. Discharged April 17, 1865; pens'd; partial dislocation of ulna; little motion of wrist; no rotation.
536	*Turner, R. N.*, Lieut., C, 1st Texas, age 32.	Oct. 7, 7, '64.	Lower, radius. Recovered, and furloughed November 2, 1864.

538	Tyrrel, E., Pt., E, 21st Massachusetts, age 18.	Nov. 24, 24, '63.	Three, right radius; by Surg. A. M. Wilder, U.S.V. (ball extr'd). Duty January 14, 1864. Not a pensioner.
539	Urtel, F., Pt., H, 151st New York, age 36.	May 18, 18, '64.	Two, lower, left ulna. Disch'd Jan. 8, '65; pens'd; hand at right angle; fingers stiff.
540	Van Campen, C., Pt., I, 89th Illinois, age 20.	May 27, 28, '64.	One and a half, middle, right ulna; by Surg. H. B. Tuttle, 89th Ill. Discharged June 3, 1865; pensioned; no rotation.
541	Van Horn, J., Pt., K, 151st New York.	June 3, 3, '64.	Middle third, right ulna. Disch'd October 1, 1864.
542	Vincent, N. H., Capt., D, 86th New York, age 24.	May 10, 10, '64.	Two, middle, left ulna; by Surg. J. S. Jamison, 86th N. Y. Duty Aug. 25, '64; pens'd; no reprod'n.
543	Volk, F. T., Lieut., C, 65th New York, age 21.	May 10, 12, '64.	Lower, left radius. Disch'd July 17, 1865; pens'd; no reproduction; hand dislocated inward.
544	Waimmn, C., Pt., I, 2d New York Heavy Artillery, age 18.	June 3, 3, '64.	Three, lower, left radius; caries. Disch'd April 3, '65; pens'd; wrist distorted; hand nearly useless.
545	Waldeck, R., Pt., H, 15th New York Heavy Artillery, age 20.	Mar. 31, 31, '65.	Lower, left radius; by Surg. T. M. Flandran, 146th N. Y. Disch'd Aug. 1, '65; pens'd; hand drawn sideways; carpus articulating with ulna alone; rotation good.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
546	Waldron, W. A., Pt., H, 20th Mass., age 21.	Sept. 19, 20, '64.	Two, middle, left radius; by A. Surg. C. S. Mann, 31st Mass. Disch'd Jan. 28, 65; pensioned; hand dislocated; useless.
547	*Walker, S. E.*, Serg't, D, 22d Virginia, age 35.	May 9, 9, '63.	Resection. Transferred to General Hospital; doing well.
548	Walker, W. H., Pt., F, 6th Pa. Res., age 27.	May 12, 12, '64.	Six, right ulna: by Surg. C. Bower, 6th Pa. Res. Duty Oct. 21, '64; pensioned; quite useless.
549	Wantland, F., Pt., B, 18th Indiana, age 22.	May 22, 22, '63.	One and three fourths, middle, right radius and ulna; by Surg. J. K. Bigelow, 8th Ind. Disch'd Oct. 15, 1863; pensioned; good use of forearm and hand.
550	*Ward, W. H.*, —, G, 44th N. C., age 30.	Oct. 1, 1, '64.	Upper third, right radius.
551	Watson, H. G., Pt., I, 48th Illinois, age 23.	Dec. 13, 14, '64.	Five, left ulna. Disch'd Mar. 30, '65; pens'd, large ugly tend. scar.
552	Warren, G. A., Pt., G, 38th Wisconsin.	Dec. 12, 12, '64.	Two, upper, left radius. Disch'd May 25, 1865; pensioned; hand pronated: no rotation.
553	Watson, W. D., Lieut., E, 71st Pa., age 27.	June 3, 3, '64.	Portion right radius: by Surg. M. Rizer, 73d Pa. Disch'd July 2, '64; pensioned July 23d, gang.; haem.; amp. shoulder joint.
554	Weaver, W., Pt., I, 11th Pennsylvania, age 27.	May 5, 6, '64.	Lower, left radius. Disch'd Apr. 10, '65; ulna dislocated at 9o'g; partial flexion thumb and finger.
555	Weekly, F. M., Pt., C, 7th W. Va., age 17.	May 10, 11, '64.	Four, upper, right ulna: by Surg. M. Rizer, 73d Pa. (wound left forearm); motion of elbow unimpaired; rotation gone. Disch'd June 7, 1865; pensioned.
556	Welchonce, L., Pt., K, 4th Ohio, age 21.	May 12, 12, '64.	One lower, right radius; by Surg. I. Scott, 7th W. Va. Disch'd June 21, '64; pensioned; disloc. ulna; not entirely useless.
557	Wells, G., Pt., B, 60th New York, age 23.	June 17, 19, '64.	Two, lower, right ulna; by Surg. J. L. Dunn, 109th Pa. Duty Nov. 24, 1864; pensioned; bone ununited; arm crooked.
558	West, A., Pt., G, 107th Illinois, age 26.	July 29, 30, '64.	Three, lower, left ulna; by Surg. J. W. Lawton, U. S. V. Duty Nov. 26, 1864; pensioned; open sore, discharging bone (1870).
559	West, E., Pt., G, 99th Illinois, age 18.	May 21, 21, '63.	Two, middle, radius and ulna. Disch'd Feb. 3, '64; pensioned: hand luxated; fingers extended.
560	Wetro, H., Pt., D, 26th Ohio, age 22.	May 29, 29, '64.	Two, middle, right ulna: by Surg. W. B. McGavran, 26th Ohio. Disc'd Feb. 14, '65; pens'd; anch. wrist; no flexion or exten. hand.
561	Weydemeyer, P. R., Sergeant, F, 1st Michigan Cavalry, age 25.	Sept. 19, 19, '64.	Upper, radius and ulna. Disch'd July 14, 1865; pensioned; anchylosis and deformity.
562	Wheeler, H. H., Lieut., E, 10th Mich., age 26.	Sept. 1, 2, '64.	Two, lower, left ulna. Duty Nov. 10, '64; pensioned; anchylosis elbow and all joints of hand.
563	Whiteraft, E. P., Corp'l, A, 10th N. J., age 28.	June 4, 5, '64.	Four, middle, left radius; by A. Surg. R. Thomas, 10th New Jersey. Disch'd Feb. 16, 1865.
564	White, J., Pt., G, 5th New Jersey.	May 31, 31, '64.	Two, left ulna. To V. R. C. Jan. 19, 1865; pensioned; part. anch. elb.; flex. fing's with little force.
565	Whitehouse, P. P., Pt., 6th N. H., age 21.	May 12, 12, '64.	Two and three-fourths, lower, right radius; by Surg. J. S. Ross, 11th N. H. Disch'd August 15, 1865; pensioned; head of ulna thrown out. *Spec.* 4378.
566	Whitfield, W. C., Pt., I, 149th Pa., age 37.	June 19, 19, '64.	Three, lower, right radius. To V. R. C. Jan. 16, '65; pensioned; dis. wrist joint; great deformity.
567	Whitaker, W., Corp'l, K, 18th Wis., age 24.	Oct. 5, 5, '64.	Four, upper, left ulna; by Surg. E. J. Buck, 18th Wis. Disch'd June 16, '65; pens'd; anchyl. elbow; general atrophy.
568	Willford, J., Pt., A, 13th Ohio, age 25.	May 27, 27, '64.	Left ulna, lower, amputation right thumb, middle, and index fingers. Disch'd Dec. 7, 1864; anchylosis wrist joint.
569	Williams, J., Pt., F, 97th Indiana, age 34.	June 27, 27, '64.	Two, lower, left ulna; by Surg. D. Halderman, 40th Ohio. Dis'd Mar. 3, '65; pens'd.
570	Williams, J., Pt., I, 92d Ohio, age 22.	June 19, 20, '64.	Three, upper, left radius. Disch'd June 2, '65; pens'd; deformity and immobility of wrist.
571	Williams, J. N., Pt., D, 5th Conn, age 20.	July 20, 20, '64.	Two, middle, left rad. To V. R. C. Dec. 21, '64; pens'd; hand dislocated; limb of little use.
572	Williams, W. Pt., A, 91st Indiana, age 30.	July 29, 29, '64.	Two and a half, lower, left ulna; by Surg. S. K. Crawford, 56th O. Disch'd March 19, 1865; pens'd; fingers semiflexed. Died Dec. 23, 1870.
573	Williams, J. P., Pt., K, 1st Maine.	Oct. 19, 19, '64.	Six, right radius; by Surg. G. T. Stevens, 77th N. Y. Duty Jan. 21, '65; pens'd; wrist dislocated; hand at obtuse angle.
574	Wilson, E., Pt., A, 4th New Jersey, age 23.	May 5, 5, '64.	Two, lower, left ulna. Duty Dec. 2, 1864. Not a pensioner.
575	Wilson, G. C., Pt., G, 14th N. J., age 23.	June 1, 3, '64.	Four, middle, left ulna; gang. Disch'd Feb. 11, '65; pens'd; motions imperfect and weak.
576	Wilson, J. P., Lt., F, 39th New York, age 18.	June 6, 6, '64.	Three, middle, right ulna. Disch'd Oct. 7, 1864; pens'd; rotation destroyed.
577	Wilson, J. P., Serg't, C, 100th Penn., age 22.	Oct. 2, 2, '64.	Two, right radius; by Surg. W. C. Shurbeck, 51st Penn. Disch'd Mar. 20, 1865; pens'd; hand supine and subluxated.
578	Wilson, S., Pt., B, 23d C. T., age 26.	July 30, 31, '64.	Three, lower, left ulna; by Surg. J. S. Ross, 11th N. H. Disch'd Mar. 21, 1865; pens'd; no use of hand; no rotation.
579	Wimble, J., Pt., D, 2d N. Y. H. A., age 25.	May 18, 19, '64.	Four, right ulna. Duty Sept. 24, 1861; pens'd; radius dislocated at elbow.
580	Wingood, J. H., Corp'l, D, 33d Mass., age 25.	May 13, 14, '64.	Upper, right ulna. Discharged April 28, 1865; anchyl. elbow and permanent extension of the fingers.
581	Widick, A. J., Serg't, B, 116th Ill., age 21.	July 28, 28, '64.	Middle, left radius; by Surg. I. N. Barnes, 116th Ill. Disch'd June 7, '65; pens'd.
582	Wiseman, E., Pt., E, 130th Indiana, age 20.	July 22, 22, '64.	Three, middle, right radius; by Surg. A. M. Wilder, U. S. V. Disch'd July 10, '65; pens'd; disloc. carpal end of ulna.
583	Wolverton, A. C., Corp'l, H, 157th N. Y.	Nov. 24, 24, '63.	Middle, right radius; gangrene. Not a pensioner.
584	Wood, G. W., Pt., C, 9th N. Y. H. A., age 43.	June 2, 3, '64.	Three, lower half, right rad. Dis'd Mar. 17, '65; pens'd; anchyl. wrist and finger joints; disloc. wrist.
585	Woodcock, H. B., Pt., C, 140th N. Y., age 24.	May 5, 7, '64.	Middle, right radius and ulna; by Surg. E. Donnelly, 2d Pa. Res. May 17, haem.; amp. forearm. Disch'd Oct. 12, '65.
586	Wright, E. H., Pt., A, 2d Pa. H. A., age 21.	June 17, 17, '64.	Three, lower, left radius. Dis'd Mar. 17, '65; pens'd; hand powerless.
587	Wyman, H., Pt., K, 26th Mich., age 28.	May 12, 12, '64.	Three, lower, right ulna; by Surg. J. W. Wishart, 140th Penn., gangrene. Disch'd May 15, '65; pens'd; rotation much impaired.
588	Young, A., Corp'l, I, 32d Wis., age 32.	Feb. 2, 2, '65.	Portion of left ulna; by Surg. A. B. Monohan, 63d Ohio (wound in side). Disch'd Nov. 10, '65, pensioned; disloc. wrist.
589	Zeis, J., Pt., I, 20th Massachusetts, age 27.	May 10, 11, '64.	Two, lower, right ulna; by Surg. N. Hayward, 2 th Mass. Deserted Oct. 20, '64. Not pens'd.

The foregoing five hundred and eighty-nine primary excisions were practised on five hundred and fifty-three Union and thirty-six Confederate soldiers. The operations were on the right extremity in two hundred and sixty-six cases, on the left in three hundred and five, unspecified in eighteen cases. The extent of removal of bone in these excisions is set forth in the foot-notes, according as the excisions interested both the bones,[1] or only the

[1] In the 34 cases of recovery after excision of the shafts of both bones of the forearm, the extent of bone removed was not definitely stated in 13 cases. In 3 cases it was reported that the greater portions of the lower, the middle, and the upper third, respectively, was removed; in 1, that an inch and a half of the ulna and an inch of the radius were excised; in 1, that an inch and three quarters of both bones was resected, in 4, 2 inches of both; in 5, 3 inches of both; in 5, between 3 and 4 inches of both; in 2, almost 4½ inches of both.

ulna,[1] or the radius[2] alone, or belonged to the group in which the bone implicated was unspecified.[3] The excisions interested all portions of the diaphysis; but the number of cases in which the operations were midway in the shafts largely predominated. One hundred and forty-seven patients returned to modified duty, thirty-six were exchanged or paroled, and four hundred and six discharged. The names of four hundred and seventy-nine were placed on the Pension List, of whom twenty-five have since died. There were thirty-eight consecutive amputations of limbs on which excision had been practised.

Fatal Cases after Primary Excision in the Forearm.—Seventy-one, or 10.7 per cent., of the six hundred and sixty determined cases of excisions in the forearm were fatal:

CASE 1897.—Private *Francis M. Hardy*, Co. B, 30th North Carolina, aged 22 years, was wounded near Fort Stevens, July 12, 1864, captured, and admitted to Lincoln Hospital, from the Defences of Washington, on the 14th. Assistant Surgeon W. Lindsly, U. S. A., reported: "Gunshot wound; a minié ball entering and shattering left ulna, lower third, passing through and entering right radius, middle third, shattering that bone and lodging." Acting Assistant Surgeon F. L. Leavitt described the case as follows: "Patient was wounded while lying behind the corner of a frame dwelling house, and in the act of firing, by a minié ball, which he states first passed through the angle of the house. Resection of both injured bones was performed on the field the same day, by Surgeon G. W. Briggs, 30th North Carolina, the arm placed on straight splints, and in this condition the patient was received in the hospital, suffering a good deal from the tightness of the bandages, the parts swelling considerably. Applied a loose water dressing merely sufficient to keep the bones in position. Signs of abscess at edge of right biceps; the exploring needle revealed pus, and the probe the presence of a foreign body which I removed, and it proved to be the bullet very much battered and irregular. 28th, doing well on iron and quinine. 29th, erysipelatous condition of left forearm; right upper extremity looks healthy. August 2d, left forearm entirely healed; right heals slowly. 8th, gangrene started in the wound of incision where the ball was extracted. 11th, arrested by bromine and stimulating poultices. 12th, patient delirous and very feverish; much prostrated and emaciated from the effects of the diarrhœa; gangrene again commenced and attacked the left forearm; bromine used with no success; brachial artery exposed for the space of two inches in right arm; a tourniquet was placed high up in the axilla ready for use if required. 13th, secondary hæmorrhage occurred this morning, about eight o'clock, from the right brachial artery, but was promptly checked and the artery tied. Afternoon, secondary hæmorrhage took place about two o'clock, in the other arm, from one of the muscular branches of the radial artery; the persulphate of iron arrested the bleeding. Evening, brachial artery sloughed through at point of ligation and a severe hæmorrhage followed; the blood being in a defibrinated condition all efforts at forming a clot failed. 17th, hæmorrhage from left ulnar artery occurred this morning, but was arrested by pressure; patient very much weakened; comatose. Died." Dr. Leavitt does not mention a hæmorrhage from the brachial, and the ligation of that artery, in his report of the case to the Surgeon General. In an account published in the *Medical and Surgical Reporter*, Vol. XIII, for 1865–6, p. 299, he states that the patient died on the 14th. At two o'clock on the afternoon of the 17th, Acting Assistant Surgeon H. M. Dean made an autopsy, and furnished the following notes: "Body considerably emaciated; *rigor mortis* well marked; height, five feet six inches. He has three sores which have evidently been the seat of phagedæna, viz: one on the inner surface of the left forearm; one on the outer aspect of the right forearm; and one on inner aspect of right arm just above the elbow; the former was in a state of gangrene. The lower half of the left ulna and a portion of the middle third of the right radius had been resected, the brachial artery stretched across the ulcer in the right arm having been entirely isolated from the surrounding tissues for a distance of two and a half inches. Lower lobe of right lung in a state of gray hepatization, with the exception of the upper portion of its free margin; posterior portion of the upper lobe also in the third stage of pneumonia, the rest of the right lung was normal; posterior portion of lower lobe of left lung in a state of gray hepatization, the rest of the lung was normal; right lung weighed twenty-three ounces, left thirteen ounces; pericardium normal; spleen normal, weight nine and a half ounces; left lobe of liver somewhat longer than usual; the right lobe was in the shape of a sugar-loaf; parenchyma normal, weight fifty-seven and one-half ounces; brain healthy, weight fifty-one and one-half ounces." The specimens, represented in the accompanying wood-cuts, were forwarded to the Museum by Dr. Dean. The first (FIG. 688) consists of the bones of the right forearm with the middle third of the radius excised; no reparative action exists at the extremities. The second (FIG. 689) consists of the bones of the left forearm from which the lower half of the ulna has been excised; the extremity of the bone shows a slight ring of necrosis and no attempt whatever at repair.

FIG. 688.—Bones of right forearm with mid. third of radius excised. *Spec.* 3085.

FIG. 689.—Bones of left forearm with lower half of ulna excised. *Spec.* 3086.

[1] The extent of bone excised from the shaft of the ulna is unspecified in 58 of the 290 cases: In 3, 1 inch was removed; in 63, from 1½ to 2 inches; in 88, from 2½ to 3 inches; in 47, from 3½ to 4 inches; in 19, from 4½ to 6 inches; in 1, the greater portion of the lower half of the shaft; in 4, the greater portion of the lower third; in 4, the greater portion of the middle third; in 2, much of the upper third; in 1, the greater part of the diaphysis.

[2] In the 256 excisions in the shaft of the radius the amount of bone removed was reported in 206 cases: In 4, an inch was excised; in 64, 1½ or 2 inches; in 73, from 2½ to 3 inches; in 32, 3½ to 4 inches; in 13, 4½ to 6 inches; in 7, the greater portion of the lower third; in 8, the greater portion of the middle third; in 4, the greater portion of the upper third; in 1, nearly the entire diaphysis.

[3] In the 9 instances in which the bone implicated was not specified, the excision was in the lower third in 1, in the upper third in 1, and its seat was not specified in 7 cases.

Many of these excisions in the continuity of the forearm were followed by amputation:

Case 1898.—Private J. Contraman, Co. G, 142d Pennsylvania, aged 20, was wounded at Spottsylvania, May 11, 1864, and admitted to Fairfax Hospital, from a Fifth Corps field hospital, on the 16th. Surgeon D. P. Smith, U. S. V., noted: "Gunshot fracture of left forearm by a minié ball. Excision of three inches of radius performed on the field." On May 18th, the parts being in a gangrenous condition, Surgeon Smith amputated the forearm at the upper third. The patient was extremely irritable. The treatment consisted in the application of simple dressings, followed by a solution of bromine. Death resulted, on May 27, 1864, from pyæmia following the amputation. The specimen, represented in the accompanying wood-cut (Fig. 690), was forwarded to the Museum by Dr. Smith. It consists of the lower two-thirds of the bones of the left forearm from which three inches of the radius were excised primarily. The age of the patient was probably overestimated.

Fig. 690.—Excision in radius. *Spec.* 3297.

Case 1899.—Private H. Conrad, Co. H, 10th New York Cavalry, aged 44 years, was wounded at the Wilderness, May 7, 1864, and sent from a Sixth Corps field hospital to Douglas Hospital, Washington. On July 18th, he was transferred to the hospital at Blackwell's Island. Acting Assistant Surgeon Stephen Smith reported: "Admitted July 20, 1864; gunshot fracture of lower extremity of radius with resection of two inches; wound sloughy. Severe secondary hæmorrhage September 9th. September 10th, amputation two inches above elbow joint; flaps of skin and circular section of muscles; at time of operation hand and forearm tensely swollen and infiltrated; hand gangrenous; patient weak from loss of blood; very much dejected and indifferent; refused food and stimulants. Wound looked well for two weeks. General and great emaciation ensued, with disintegration of the margin of the flaps. Result: death from inanition, September 23, 1864. The autopsy revealed no morbid appearances except great emaciation."

Case 1900.—Private James Ryal, Co. H, 43d Colored Troops, aged 19 years, was wounded at Petersburg, July 30, 1864, by a minié ball, which fractured the left ulna. Surgeon James P. Prince, 36th Massachusetts, excised an inch and three-fourths of the left ulna at a Ninth Corps field hospital, and on August 18th the patient was admitted to Summit House Hospital, Philadelphia, from City Point. Surgeon J. H. Taylor, U. S. V., reported: "August 19, 1864, extensive sloughing of wound, exposing elbow joint; patient in very feeble health; has some pleurisy in left side. 23d, elbow joint still exposed; slough extending along up the arm. Acting Assistant Surgeon W. W. Shapley amputated the arm at middle third of humerus by the circular operation; chloroform used; general health of the patient bad; appetite very poor. The treatment consisted of simple dressings to the wound, tonics and stimulants; extra diet, milk-punch, and beef tea freely given. 24th, patient somewhat better, still very weak. 25th, stump looks tolerably well. 26th, stump sloughing at under part. 27th, patient seems somewhat better; appetite improving. 28th, secondary hæmorrhage occurred from profunda artery, consequent upon extensive sloughing; patient lost about thirty ounces of blood; the artery was not ligated; local treatment, permanganate of potassa to sloughing wound; general treatment, tonics, stimulating expectorants, and counter-irritants; patient very much debilitated throughout. Died August 29, 1864, of exhaustion from secondary hæmorrhage." The specimen (Fig. 691) was sent to the Museum by Dr. Shapley. An inch and three-fourths has been excised from the middle third of the ulna; its extremities are necrosed, as well as the adjoining surface of the radius. Beyond the necrosis are slight friable osteophytic deposits.

Fig. 691.—Excision in ulna. *Spec.* 3666.

Case 1901.—Private John Vandyke, Co K, 107th New York, aged 21 years, was wounded at Gettysburg, July 3, 1863, and admitted to a Twelfth Corps field hospital, where Surgeon H. E. Goodman, 28th Pennsylvania, noted: "Compound fracture of right radius and ulna by a minié ball. Resection of two and a half inches of ulna, middle third, by Surgeon W. H. Twiford, 27th Indiana, July 4th." On July 23d, the patient was transferred to Letterman Hospital, Gettysburg, where Acting Assistant Surgeon Edwin Martin described the case as follows: "Gunshot wound of right forearm. Ball passed through forearm directly over the ulna, about three inches below the elbow. On examination, it was found that the ulna was fractured and the radius slightly grazed. The patient was put on medium diet, cold-water dressings were applied to the wound, and quinine and iron administered internally. When brought to this hospital he was in good condition, but in a few days it became apparent that his strength would fail before the discharge would subside. Stimulants, however, were persistently given until this date (August 24th), when it was decided to amputate, which operation I performed by the circular method, at the middle third of the arm, as the inflammation had extended to that distance." The patient died of hectic fever September 12, 1863. There is a specimen in the Museum from this case (No. 443), a stump of the humerus, with annular necrosis.

Table CXXVII.

Condensed Summary of Seventy-one Fatal Primary Excisions of the Bones of the Forearm.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Anderson, R., Pt., G, 30th Colored Troops.	July 30, 31, '64.	Three, lower, right radius (also amp. fingers): by Surg. D. Mackay, 29th C.T. Died Aug. 19, '64.	3	Beale, J., Corp'l, H, 53d Ohio.	June 27, 27, '64.	Two and a half, radius and ulna: by Surg. A. C. Messenger, 57th O. Died July 25, 1864, congestion of lungs.
2	Antheine, J., Serg't, D, 13th Illinois.	Nov. 27, 27, '63.	Portion of right radius. Jan. 1, 1864, amputation of arm. Died Jan. 2, 1864, pyæmia.	4	Bente, W., Pt., N, 198th Pennsylvania, age 28.	Mar. 29, 30, '65.	Excision: gangrene: hæmorrhage. Died April 8, 1865, exhaustion

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
5	Bishop, E., Pt., A, 1st Connecticut Cav.	Nov. 12, 12, '64.	Two, lower, left radius; by Surg. N. D. Ferguson, 8th N. Y. Cav. Died Dec. 9, 1864, pyæmia.
6	Bullard, I. B., Corp'l, H, 57th Mass., age 27.	May 24, 24, '64.	Upper, left radius. Died May 30, 1864.
7	Burton, L. C., Pt., D, 78th Illinois, age 22.	May 9, 9, '64.	Three, middle, left ulna; by A. A. Surg. S. M. Olden. Died June 26, '64, colliquative diarrhœa.
8	Carrol, M., Pt., E, 164th New York, age 37.	June 16, 16, '64.	Portion of left radius; by Surg. M. F. Regan, 164th N. Y. (also wound thigh). Died July 17, '64.
9	Chesly, W. H., Pt., F, 120th N. Y., age 18.	Nov. 25, 25, '64.	Portion lower, ulna. Died Feb. 16, 1865, exhaustion.
10	Conrad, H., Pt., H, 10th N. Y. Cav., age 44.	May 7, 8, '64.	See Case 1899.
11	Cornelius, J. M., Pt., K, 4th Pa. Cav., age 23.	March 28, 30, '65.	Three, middle, left radius; by Surg. D. W. Maull, 1st Del. Died July 15, 1865, acute dysentery.
12	Contraman, J., Pt., G, 142d Pa., age 20.	May 11, 12, '64.	See Case 1898.
13	Crimmer, X., Corp'l, I, 53d Pa., age 19.	March 31, 31, '65.	Two and a half, lower, right radius; by Surg. P. E. Hubbell, 28th Mass. May 5, amp. forearm. Died May 23, 1865, pyæmia.
14	Davis, J., Pt., E, 143d Pennsylvania, age 24.	June 18, 18, '64.	Portion radius. June 23d, amp. arm. Died Sept. 13, '64, pyæmia.
15	Dawson, R. F., Capt., I, 85th Pennsylvania, age 24.	Jan. 15, 15, '65.	Left ulna, middle; by Surg. G. C. Jarvis, 7th Connecticut. Died February 1, 1865, exhaustion.
16	Dumas, J. C., Pt., H, 105th New York.	May 12, 12, '64.	Lower, right radius; ball passed into pelvic cavity. Died May 22, 1864.
17	Durant, J. M., Pt., E, 11th Vermont, age 26.	June 1, 1, '64.	Right ulna, upper; by A. Surg. C. B. Park, 11th Vt. (also wound of knee). Died July 31, 1864, typhoid fever.
18	Ewen, J. S., Pt., I, Pennsylvania Heavy Artillery.	July 30, 30, '64.	Three, middle, right radius; by Surg. W. V. White, 57th Mass. Died Aug. 19, '64, hæmorrhage.
19	Felter, J., Pt., G, 33d New Jersey.	May 25, 25, '64.	Portion, left ulna; by Surg. J. Reily, 33d N. J. Died May 27, 1864.
20	Frink, G. W., Serg't, H, 14th New York Heavy Artillery.	July 30, 30, '64.	Two and a half, lower, left radius; by Surg. J. Oliver, 21st Mass. Died August 7, 1864.
21	Garboden, W. H., Lieut., B, 30th Indiana.	Sept. 19, 19, '63.	Left forearm. Died October 28, 1863.
22	Griswold, H., Pt., K, 151st New York, age 31.	June 3. 1864.	Two-thirds, radius; June 11, left arm amputated. Died June 19, 1864, heart disease.
23	Grover, J., Pt., D, 79th Illinois, age 34.	June 22, 22, '64.	Portion lower, left rad.; by Surg. S. J. Young, 79th Ill.; gangrene. July 19, three, lower end; by A. A. Surg. D. J. Griffith; hæm.; July 24, amputation forearm. Died July 30, 1864.
24	*Hardy, F. M.*, Pt., B, 30th N. C., age 22.	July 12, 12, '64.	See Case 1897.
25	Harmon, J., Corp'l, A, 31st Illinois.	July 22, 22, '64.	Lower, right ulna; by Surg. H. McKennan, 17th Wis. Died September 26, 1864.
26	Heatherby, J., Pt., E, 11th West Virginia, age 35.	Oct. 28, 29, '64.	Left radius and ulna, upper; by A. Surg. W. A. Banks, U. S. V.; lig. brachial; hæm. Jan., arm amputated. Died Jan. 24, 1865, pyæmia.
27	Henderson, N. W., Pt., E, 123d Ohio.	Sept. 19, 19, '64.	Two and a quarter, right ulna; Nov. 6, amp. thigh. Died Nov. 6, 1864, pyæmia.
28	Holter, R. J., Pt., F, 59th Ohio.	June 4, 4, '64.	Left radius and ulna. Died June, 1864.
29	Howe, A. W., Pt., K, 57th Massachusetts.	July 30, 30, '64.	Two and a half, left radius; by Surg. G. W. Snow, 35th Mass. Died Aug. 8, 1864, hæmorrhage.
30	Hunt, C., Pt., H, 57th Indiana, age 22.	June 22, 22, '64.	Portion right ulna; by Surg. E. B. Glick, 40th Ind.; gang. July 15, amp. forearm; July 19, arm amputated. Died July 21, 1864, exhaustion.
31	Kelley, J. D., Serg't, B, 29th C. T., age 33.	Oct. 4, 4, '64.	Portion left ulna; by Surg. M. S. Kittenger, 100th N. Y. Died Oct. 31, 1864, acute pleurisy.
32	Kelly, D., Corp'l, H, 6th Wisconsin, age 32.	May 10, 10, '64.	Three, right radius; hæmorrhage. May 23, amp. forearm. Died June 23, 1864, pyæmia.
33	Kuhns, R., Pt., C, 11th Pennsylvania, age 50.	May 10, 10, '61.	Left radius, lower. Died Aug. 23, 1864, diarrhœa.
34	Kulthan, H., Serg't, L, N. J. Cav., age 27.	May 28, 28, '64.	Two, right radius; hæmorrhage. June 11, arm amputated. Died June 19, 1864, pyæmia.
35	Lockard, J., Pt., D, 53d Ohio.	June 27, 27, '64.	Lower two-thirds of left ulna; by Surg. L. P. Bonner, 47th Ohio; gangrene. July 4, amp. arm; hæmorrhage. Died July 6, '64.
36	Manning, P., Pt., D, 20th Massachusetts.	July 3, 3, '63.	Right and left radii, middle; by Surg. N. Hayward, 20th Mass. Died July 12, 1863.
37	Mathews, A., Pt., C, 83d Indiana, age 20.	June 19, 19, '64.	Two and a half, lower, left ulna; by Surg. J. Bennet, 19th Mich.; gangrene. July 17, amp. arm. Died Aug. 29, 1864, pyæmia.
38	McAllister, H. V., Pt., D, 148th Pa., age 21.	June 4, 4, '64.	Three, middle, left radius. Died August 11, 1864.
39	McCrew, M., Pt., H, 6th Kentucky.	May 14, 14, '64.	Portion of left ulna. Died July 13, 1864.
40	Montgomery, T. A., Pt., I, 207th Pa., age 35.	April 2, 2, '65.	Right ulna, middle. Died April 22, 1865.
41	Mulford, W. D., Pt., D, 63th Ohio.	Nov. 25, 25, '64.	Right radius, lower. Died December 15, 1863.
42	Newman, C., Pt., K, 3d Missouri.	Aug. 14, 14, '64.	Three, right radius; by Surg. A. Sabine, 70th Ohio. Died Aug. 20, 1864.
43	Ogden, O., Pt., K, 5th Mich. Cav., age 21.	Sept. 24, 24, '64.	Portion of left ulna. Died Feb. 23, 1865, small-pox.
44	Perry, A. D., Serg't, E, 2d Michigan, age 28.	June 1, 1, '64.	Three, upper, left radius; by Surg. S. S. French, 20th Mich.; gang. Amputation arm June 28. Died July 17, 1864, pyæmia.
45	Phillips, A., Pt., L, 16th Pa. Cavalry, age 18.	May 8, 8, '64.	Right ulna, middle. Died May 31, 1864, pyæmia.
46	Phillips, J., Pt., E, 3d Md. Cav., age 26.	Mar. 4, 4, '64.	Two, lower, left radius; hæmorrhages. May 27, amp. of arm. Died same day, exhaustion.
47	Pope, G. W., Lieut., F, 24th Mass., age 35.	June 17, 18, '64.	Two, lower, radius and ulna; by Surg. H. Luddington, 166th Pa. Died August 5, 1864.
48	Preston, S., Pt., E, 63d New York, age 23.	June 3, 3, '64.	Portion of bone; by Surg. P. E. Hubon, 28th Mass. (also penetrating wound of side). Died June 14, 1864.
49	*Ransom, J. W.*, Pt., A, 14th Virginia, age 38.	Aug. 19, 20, '61.	Two, middle, right ulna. Died Nov. 28, '64, carbuncle on neck.
50	*Robinson, J. B.*, Corp'l, G, 53d N. C., age 24.	July 2, 4, '63.	Three, middle, left radius; by Surg. J. S. Dunn, 10th Pa. (also fract. scapula). Died Sept. 9, '63.
51	Robinson, J. Serg't, H, 48th Illinois.	May 26, 26, '64.	Three, right radius (also amp. thigh); by Surg. A. Goslin, 48th Illinois. Died June 1, 1864.
52	Rock, J. J., Pt., F, 45th Pennsylvania, age 23.	May 14, 14, '64.	Three, lower, left ulna; by Surg. T. Christ, 45th Pennsylvania. Died June 9, 1864, pyæmia.
53	Ryal, J., Pt., A, 43d C. T., age 19.	July 30, 31, '64.	See Case 1900.
54	Salling, J., Pt., F, 3d East Tenn., age 24.	Feb. 12, 12, '64.	Three, right radius. Died Feb. 22, 1864, tetanus.
55	Simonds, B., Pt., C, 146th New York.	Sept. 3, 3, '64.	One and a half, radius and ulna; by Surg. T. M. Flandrau, 146th New York. Died Oct. 4, 1864.
56	Stevenson, S., Pt., D, 53d Ohio.	Aug. 31, 31, '64.	Portion lower, right ulna. Died Sept. 16, 1864, diarrhœa.
57	Stone, J. H., Serg't, K, 7th Maine, age 24.	May 11, 11, '64.	Four, lower, right radius; by Surg. F. M. Eveleth, 7th Maine; amp. arm; pyæmia. Died June 16, 1864, asthenia.
58	Swartz, W., Pt., I, 20th Illinois, age 30.	Mar. 30, 30, '65.	Lower half of right radius; by Surg. A. G. Hunt, 11th Illinois. April 24, arm amp. Died May 4, 1865, typhoid pneumania.
59	Thomas, J. M., Corp'l, C, 120th Indiana.	June 14, 14, '64.	Two, lower, left ulna; by Surg. J. F. Kimbly, 11th Ky. Died Aug. 4, '64, chronic rheumatism.
60	Tunnel, I., Pt., K, 32d C. T., age 32.	Feb. 10, 19, '65.	Portion of left ulna. Died March 9, 1865, double pneumonia.
61	Tyler, E. S., Pt., H, — N. H., age 29.	May 11, 11, '64.	Portion lower, right radius; by Surg. A. Goslin, 7th R. I. Died June 6, 1864, tetanus.
62	Vancomer, E., Pt., H, 149th New York.	July 20, 20, '64.	Portion middle, right ulna; by Surg. J. V. Kendall, 149th N. Y. Died July 21, 1864
63	Van Dean, A. F., Pt., I, 116th Pennsylvania.	Dec. 13, 13, '62.	Excision. Died January 7, 1863.
64	Vandermark, N., Pt., G, 5th New York, age 25.	June 11, 11, '61.	Portion lower, ulna. Discharged Nov. 19, '64. Amp. forearm Mar., 1865. Died November 23, 1866, effects of gangrene.
65	Van Dyke, J., Pt., K, 107th N. Y., age 24.	July 3, 4, '63.	See Case 1901.
66	Van Vliet, J. M., Pt., H, 107th New York.	May 25, 25, '64.	Portion of right radius (also amp. thigh). Died June 24, 1864.
67	Webber, P., Serg't, E, 57th Ohio, age 22.	June 27, 27, '64.	Portion lower, right radius; by Staff Surg. C. B. Richards, U. S. A. Died June 27, 1864.
68	Weeble, B. F., Pt., H, 149th Pennsylvania.	May 5, 5, '64.	Portion left ulna. May 14, amp. forearm. Died May 15, 1864, tetanus.
69	Wise, M., Serg't, E, 53d Ohio.	July 22, 22, '64.	Portion of middle, left ulna; by Surg. S. P. Boana, 47th Ohio. Died August 10, 1864.
70	Woodruff, R., Capt., C, 31st Colored Troops.	July 30, 30, '64.	Two, left ulna; by Surg. F. M. Weld, 27th C. T. Died Aug. 11, 1864, tetanus.
71	Woodward, E. F., Pt., I, 53d Pennsylvania.	Dec. 13, 13, '62.	Radius (also tibia). Died January 6, 1863.

§ *Primary Excisions in the Forearm with undetermined Results.*—Five cases of this group complete the record of six hundred and sixty-five primary excisions in the forearm:

Cases 1902–1906.—Pt. *I. Hadley*, B, 7th Louisiana, age 35 years, wounded May 13, 1864; compound comminuted fracture of left ulna; May 13th, resection of four inches of shaft.——Pt. *E. W. Honeycut*, C, 13th Mississippi, age 28 years; wounded July 3, 1863; fracture of ulna; resection of three inches of shaft same day.——Pt. *P. R. Lanier*, D, 4th Georgia, age 21 years; wounded May 2, 1863; fracture of ulna; resection of five inches of shaft May 3d.——Sergeant *L. Lesser*, A, 4th Georgia, age 27 years; wounded May 2, 1863; compound comminuted fracture of radius; May 3d, four inches of its shaft were resected.——Pt. *R. J. Smoot*, A, 53d Virginia; wounded May 23, 1864; fracture of ulna; resection of a portion of shaft same day.

Intermediary Excisions in the Bones of the Forearm.—There were one hundred and forty-nine cases reported in this group, with a mortality of 19.4 per cent., or nearly double that of the primary operations.

§ *Recoveries after Intermediary Excisions.*—In nine cases these excisions involved both bones, in sixty-four the ulna,[1] in forty-seven the radius.[2] Examples of each group precede the tabular statement:

Case 1907.—Private W. D. Boyce, Co. I, 124th New York, age 37 years, was wounded before Petersburg October 27, 1864. On the following day he was admitted to the Depot Hospital of the Second Corps, at City Point, where Surgeon G. B. Parker, U. S. V., recorded: "Gunshot wound of right arm. Surgeon O. A. Judson, U. S. V., reported the wounded man's admission to Carver Hospital, Washington, October 30th, and described the injury and operation, which he performed, as follows: "Gunshot wound of right forearm, a conoidal ball entering the posterior and middle portion, producing a compound comminuted fracture of the middle third of the shaft of the ulna, and lodging in the wound. At date of admission the wounded parts were greatly swollen and slightly œdematous. The constitutional state, however, was tolerably good, but he seemed somewhat exhausted, and was suffering from anorexia. On November 1st, the patient was anæsthetized and the wound thoroughly examined, when it was thought proper that excision should be performed. Six inches of the middle portion of the shaft of the ulna was removed by a straight incision and the missile was extracted. The patient rallied promptly from the shock of the operation and continued to improve without any unfavorable complication, the wound filling rapidly with healthy granulations. Simple dressings were applied, and tonics and nourishing diet were administered. December 31st, the wound is healing rapidly. The above treatment has been continued; patient has had no unfavorable symptom. March 31st, the wound has entirely healed with loss of rotatory motion of forearm, otherwise the arm being very useful." The specimen, consisting of the excised portion of the ulna, and represented in the adjacent wood-cut (Fig. 692), was contributed to the Museum by the operator. The patient was discharged from service April 13, 1865, and pensioned. Examiner J. Nichols, of Washington, D. C., April 20, 1865, certified: "* * Great deformity. Limb entirely useless for even light labor. It is an impediment to labor," etc. Examiner J. H. Helmer, of Lockport, N. Y., certified, August 29, 1865: "* * Elbow dislocated. He cannot close his hand," etc. The Lockport Examining Board, consisting of Drs. Helmer and S. T. Clark, reported, October 11, 1873: "* * Dislocation of elbow still unreduced. * * Pronation and supination is destroyed. The arm is useless, as perfectly so as if amputated at the elbow joint." The pensioner was paid September 4, 1875. A photograph, taken about the time of his discharge, and recently obtained from the Pension Bureau, is copied in the annexed cut (Fig. 693).

Fig. 692.—Six inches of right ulna excised for shot fracture.—*Spec.* 4235.

Fig. 693.—Cicatrix six months after an excision in the shaft of the ulna.

Among the intermediary excisions in the shaft of the ulna were many such examples as the foregoing of removal of very considerable portions of the diaphysis.

[1] In addition to the instances cited of excisions in the shaft of the ulna enumerated on page 935, the following may be adduced: Warmuth (Rust, J. N.) (*Handbuch der Chir.*, 1832, B. VI, S. 544), in 1827, excised part of the ulna, in a girl of 19 years, for ununited fracture. Adelmann (Georg) (*Erfahrungen und Bemerkungen über Resection der Knochen*, in *Prager Vierteljahrschrift*, 1868, Jahrg. XV, B. III, S. 43) resected, at Dorpat, August 9, 1841, an inch and a half of the diaphysis of a diseased ulna, in the case of Emma V——, aged 20 years, a good recovery followed. Blandin (*Gaz. Med.*, 1843, T. XI, p. 51) presented, at the meeting of the Paris Academy of Medicine, January 17, 1843, a portion of the ulna, an inch and a half long, that he had excised eight months previously. Pitha (*Ueber die Operative Behandlung der Necrose*, in *Allg. Wiener Med. Presse*, 1863, No. 11, S. 81) excised a large portion of a diseased ulna, in 1845, at the clinic at Prague, in a farmer, aged 26 years; a good result ensued. Metz (*Resect. eines 3 Zoll langen Stückes des unteren Endes der Ulna*, in *Deutsche Klinik*, 1851, B. III, S. 410) resected three inches of the lower end of the ulna in the case of an operative in a factory, in 1850, for injury from machinery; good results. Dr. Robert, whose elaborate articles on this subject constitute the most important contribution to the literature of excisions of the ulna that has been made (*Eine Reihe Resectionen an der Ulna ausgeführt*, in *Deutsche Klinik*, 1855, B. VII, S. 144, etc.), cites no less than nine examples of excision of the ulna for disease, viz: H. Neebe, aged 12 years, 1845; M. Prugold, aged 14 years, 1849; D. Garthe, aged 2½ years, 1848; K. Menninger, aged 14¾ years, 1848; M. Sartorius, aged 18 years, 1852; S. Saffenventu, aged 15 years, 1852; M. Fassbender, aged 13 years, 1853; J. Conrad, aged 14 years, 1853; L. Wahl, aged 45 years, 1848. Each of the cases are described in detail, and in nearly all the pathological preparations are handsomely engraved. Wutzer (O. Weber *Die Knochengeschwülste*, in *Anat. und Prakt. Beziehung*, Bonn, 1856, B. I, S. 155) excised, for exostosis, the middle portion of the ulna, in a man aged 19 years. There was no new formation of bone three years after the operation, but a solid fibrous connection. Garnett (A. S.), *Case of resection and exsection in a fracture of the ulna*, in *Transactions of Med. Assoc. State of Alabama*, 1871, p. 148.

[2] A large number of examples of excisions in the continuity of the radius are cited in the foot note commencing on page 937. Twenty six examples of excisions of the lower extremity of the bone for shot injury will be detailed in the next Section, under the head of excisions at the wrist.

CASE 1908.—Corporal J. Lefevre, Co. H, 28th Pennsylvania, aged 28 years, was wounded in the right forearm at Antietam, September 17, 1862. Six days afterward he was admitted to Hospital No. 1, Frederick, where he underwent excision. Acting Assistant Surgeon W. W. Keen, jr., who performed the operation, described the case as follows: "The ball entered the ulnar side of the forearm posteriorly, about two and a half inches above the carpal extremity, fractured the ulna, emerged, and immediately re-entered at the bend of the elbow, and made its exit at the middle of the arm posteriorly. The ulna was much comminuted, the radius and humerus were uninjured, and the bicipital fascia was exposed at the elbow, neither the radial nor ulnar pulse being perceptible. On September 28th, five and a half inches were resected in the continuity of the bone, leaving a large amount of periosteum. October 14th, the wound is granulating and cicatrizing. Motion at the elbow is quite good, that of the fingers improving; pronation and supination to some extent, and improving under passive motion. General condition better. November 3d, wound all united but not cicatrized. Has had two chills at the interval of a week, but they have yielded to quinine and sulphuric acid. Good diet and moderate amount of stimulants have been given. Motion is better. 16th, doing well; no more chills; line of incision almost healed. Passive motion is not quite so effective as I could desire, but it is improving. Flexion and extension of the elbow is good, also pronation and supination, but flexion and extension of the fingers is poor. Patient is awaiting his discharge." The specimen, represented in the annexed cut (FIG. 694), consists of the excised portion of the ulna. It was contributed by the operator. The patient was discharged from service January 16, 1863, and pensioned. Examiner G. McCook, of Pittsburg, Pennsylvania, January 30, 1863, certified: "A bullet entered at the outer part of the right wrist and passed upward to near the middle of the humerus. It destroyed five inches or more of the ulna and has permanently injured or ruined the median nerve and its main branches. The hand is useless." The Pittsburg Examining Board, consisting of Drs. A. G. McCandless, J. W. Wishart, and W. J. Gilmore, September 20, 1873, certified: "The forearm is wasted, the hand cold and blue; pronation and supination is lost." The pensioner was paid September 4, 1875.

FIG. 694.—Five and a half inches of the right ulna. *Spec.* 823.

The next case is one of the nine recoveries[1] after excisions of both bones:[2]

CASE 1909.—Private J. B. Cooper, Co. D, 122d Ohio, aged 28 years, was wounded at Cold Harbor, May 31, 1864, and admitted to the field hospital of the 3d division, Sixth Corps, where Surgeon R. Barr, 67th Pennsylvania, noted: "Gunshot fracture of right forearm; simple dressings applied." On June 4th, the wounded man entered Emory Hospital, and was transferred to Patterson Park Hospital. Surgeon T. Sim, U. S. V., reported: "Gunshot comminuted fracture of radius and ulna at middle third. The bones were very much shattered, and the parts very much swollen by the accumulation of matter; health of patient very good. On June 17th, A. V. Cherbonnier extracted all the loose fragments and resected both ends of both bones, removing altogether three inches, the extent of the incision being four inches. Chloroform was used. The patient's progress was favorable. The arm was placed upon a simple splint and dressed altogether with dry oakum, water only being used in washing the wound with castile soap twice a-day. On July 23d, the patient was transferred to Ohio by order of the Secretary of War. At the date of transfer, he was able to lift the arm from the splint, and, although recovery was not complete, a most favorable result was promised." He entered Seminary Hospital, Columbus, and was discharged from service September 30, 1864. Examiner E. A. Kratz, June 15, 1874, certified: "Ball entered four inches below elbow, outer side, fracturing radius and ulna. Bony union at seat of injury. Arm is permanently pronated and deflected downward; the thumb is behind; radius and also ulna one inch shorter than natural; arm somewhat atrophied; cicatrix adherent to bones; moderately good use of wrist and hand. Complains that sensation is destroyed." This pensioner was paid September 4, 1875.

The next case was complicated by consecutive hæmorrhage and ended in amputation:

FIG. 695.—Four inches of right radius and pieces of lead. *Spec.* 1089.

CASE 1910.—Sergeant *S. T. Wilfong*, Co. A, 12th North Carolina, aged 19 years, was wounded at Chancellorsville, May 3, 1863, and entered Lincoln Hospital, Washington, one week afterward. Acting Assistant Surgeon H. M. Dean reported: "Compound comminuted fracture of right radius in its middle third by a minié ball. May 11th, resected some four inches of the shaft of the radius. In the operation the interosseous artery was wounded high up, and, owing to the close proximity of the elbow joint, could not be got at to tie. The forceps was therefore left on it to control the hæmorrhage, which it did very effectually. 15th, a large abscess has formed, which, although opened freely, is connected by a sinus from the wrist to the elbow. 17th, had hæmorrhage from the wound about noon; forceps still in the wound. 18th, had hæmorrhage at four o'clock P. M., and again at five and a half o'clock P. M., which was very persistent. Amputation of the arm in the lower third was agreed upon, and performed the same afternoon, by antero-posterior skin flaps, by Surgeon H. Bryant, U. S. V. 19th, patient is feeling quite comfortable. 21st, still continues to do well; appetite very good. 26th, has had no bad symptoms since the operation. June 1st, still continues to recover." The excised portion of the radius is represented in the adjacent wood-cut (FIG. 695), two flattened pieces of lead, as though a distorted ball and a buckshot, being mounted with the specimen. The specimen was contributed by Assistant Surgeon H. Allen, U. S. A. Surgeon G. S. Palmer, U. S. V., recorded that "the patient was transferred to the Old Capitol Prison June 25, 1863."

[1] Five of the operations were on the right, and four on the left forearm. Considerable portions of the shafts were removed: in 2 instances, 3 or 3½ inches of both bones; in 2, at least 5 inches of the ulna and somewhat less of the radius; in 4 cases, about 2½ inches of both bones.

[2] In addition to the examples of excisions in the shafts of both bones of the forearm cited on page 934, the following may be consulted: A. INGLIS (*Observations on the Cure of those Unnatural Articulations which are sometimes the consequence of Fractures in the Extremities*, in *The Edinburg Med. and Surg. Jour.*, 1805, Vol. I, p. 419), in 1802, resected the ends of both bones of the forearm for fracture, in the case of Margaret Adie, age 20; the patient was discharged in about 2 months, perfectly cured. G. W. NORRIS (*Med. Examiner*, 1840, Vol. III, p. 205), in the case of G. D———, a lad of 12, with fracture with protrusion of the left ulna and radius, all other efforts at reduction proving unavailing, removed the extremities of both bones by LISTON'S pliers. Firm osseous union without deformity resulted. G. MAY recorded (*London Med. Gaz.*, 1846, N. S., Vol. III, p. 487) a case of pseudarthrosis affecting both bones of the forearm, successfully treated by resecting the ends of the bones.

The next case, remarkable for resulting favorably after a ligation of the brachial, is followed by an example of synostosis of the ulna with the radius, and that in turn by a case of pseudarthrosis in the radius:

CASE 1911.—Private R. Rees, Co. A, 105th Ohio, aged 30 years, was wounded at Perryville, Kentucky, October 8, 1862, and admitted to Hospital No. 4, where Assistant Surgeon G. W. Carr, 129th Ohio, noted: "Gunshot wound of elbow." Acting Assistant Surgeon M. N. Elrod reported: "The patient was admitted to Hospital No. 4, New Albany, October 20th, for hæmorrhage from gunshot wound of right forearm, the ball entering near the inner condyle of the humerus and passing out near the middle of the forearm, causing compound fracture of the ulna. When the hæmorrhage occurred he was just convalescing from measles. The wound had a healthy appearance, and there was but slight swelling. On October 22d, hæmorrhage occurred to an alarming extent, and, after many fruitless attempts to find its source, the brachial artery was ligated with only temporary relief. It was then determined to try excising the shattered fragment of the ulna, which was done by Surgeon W. Varian, U. S. V., making an incision parallel with the bone and removing three inches of the shaft including the fragments. The wound did well from this, except slight erysipelas, without any further hæmorrhage." The excised part of the ulna was contributed to the Museum by the operator, and is represented in the cut (FIG. 695). By several fractures the specimen is divided longitudinally into three fragments, which are necrosed on the borders of the lines of solution, but over their greater surface present friable deposits. The patient was discharged from service January 6, 1863, and pensioned. Examiner E. Mygatt, of Youngstown, Ohio, June 4, 1867, certified: "Anchylosis of right elbow joint, in consequence," etc. Examiner C. S. Leonard, of Ravenna, Ohio, reported, June 4, 1869: "* * Arm decidedly atrophied; wrist joint anchylosed; hand and arm useless. Disability equal to loss of hand." The pensioner was paid June 4, 1875.

FIG. 696.—Three inches of right ulna excised. *Spec.* 338.

CASE 1912.—Private S. Painter, Co. K, 122d Ohio, aged 33 years, was wounded at Spottsylvania, May 12, 1864, and admitted to the field hospital of the 3d division, Sixth Corps, where Surgeon R. Barr, 67th Pennsylvania, recorded: "Gunshot wound of right forearm." On May 21st, the wounded man entered Finley Hospital, Washington. Surgeon G. L. Pancoast, U. S. V., reported: "Gunshot fracture of ulna, the ball entering the outer side of the forearm at the middle third. The missile was extracted by a surgeon on the field. On May 24th, an operation was performed, consisting of excision of the fractured ends by chain saw and the removal of the spicule. The wound healed by healthy granulations." The specimen, represented in the cut (FIG. 697), consists of the excised part of the ulna, amounting to one and a half inches. It was contributed by the operator. On February 4, 1865, the patient was discharged from service and pensioned. Examiner J. Nichols, of Washington, D. C., certified, February 11, 1865: "Removal of four inches of shaft. Pronation and supination lost. Loss of use of wrist joint by anchylosis. Loss of use of all the fingers by reason of injury to extensor tendons—the fingers all remaining permanently extended. Limb quite useless and will never be restored." Examiner H. Culbertson, of Zanesville, Ohio, certified, January 13, 1870: "* * A portion of the flexor and extensor muscles, etc., on external aspect, are destroyed, producing contraction as well as partial atrophy. * * The elbow joint is normal. The motion of the wrist joint is unimpaired. The upper end of the lower fragment of the ulna is united to the radius by bony union. The function of rotation is obliterated," etc. Substantially the same was reported at an examination in September, 1873. The pensioner was paid September 4, 1875.

FIG. 697.—Inch and a half of right ulna. *Spec.* 2480.

CASE 1913.—Private W. B. Bradford, Co. I, 20th Maine, aged 20 years, was wounded at the Wilderness, May 5, 1864, and admitted to the field hospital of the 1st division, Fifth Corps, where Surgeon W. R. DeWitt, jr., U. S. V., noted: "Gunshot wound of arm." Surgeon O. A. Judson, U. S. V., in charge of Carver Hospital, Washington, furnished the specimen (FIG. 698) and the following history: "The missile, a conoidal ball (probably), entered the middle of the right forearm on the radial side, passing transversely through, and produced a compound comminuted fracture of the middle third of the radius. The general condition of the patient at date of admission—May 11th—appeared good. Simple dressings were applied, and a pint of ale was ordered during every twenty-four hours. May 20th, patient anæsthetized and about three inches of radius removed, by Acting Assistant Surgeon W. C. Clark, making a straight incision, and removing sequestra and the serrated ends of the bone with the chain saw. The incision was then filled with charpie and cold-water dressings applied. 25th, wound filling rapidly with healthy granulations. Appetite good. Treatment continued. June 1st, patient about the same; the wound secretes a large quantity of laudable pus; simple cerate dressings used. 12th, pus burrowing about forearm to slight extent; free incisions were made. July 18th, has continued to improve. Wound now nearly healed. Patient was furloughed to-day. September 16th, patient returned from furlough." The specimen consists of eleven fragments, comprising the excised portion, from the middle of the radius. The patient was discharged from service March 2, 1865, and pensioned. Examiner J. Nichols, of Washington, D. C., March 7, 1865, certified: "* * * No union has yet taken place; movable false joint exists, rendering hand and limb nearly useless for labor." Examiner C. N. Germaine, of Rockland, Me., September 5, 1867, certified: "* * * The usual action required by an effort to use any implement, etc., produces severe pain in the affected limb. Besides this, the arm is almost entirely deprived of its rotary power. His arm is useful so far as regards any duty which does not require dexterity or strength. The arm is now in a worse condition than formerly, in consequence, I presume, of necrosis of one of the excised ends of the radius *in situ*, which more effectually destroys the power and comfort of the limb," etc. In September, 1873, the same examiner reported: "The wrist joint is partially anchylosed, pronation and supination of his arm injured, and his arm much reduced in power. Manual labor of an hour or less completely exhausts his arm." The pensioner was paid September 4, 1875.

FIG. 698.—Eleven fragments of right radius removed by excision. *Spec.* 2297.

Among the hundred and twenty recoveries after intermediary excisions in the forearm, were eleven instances of secondary hæmorrhage, three consecutive amputations in the forearm, and six in the upper arm:

Case 1914.—Captain J. H. Meyer, Co. G, 11th New Jersey, aged 34 years, was wounded at Chancellorsville, May 3, 1863. Assistant Surgeon G. Ribble, of the regiment, recorded the injury as "wound of arm, severe." On May 9th, the patient reached Washington, where he was treated by Surgeon C. L. Allen, U. S. V., who contributed the two specimens with the following report: "The ball entered externally near the middle of the left forearm, producing a comminuted fracture of the radius, and making its exit from the inner surface through the flexor muscle. The wound of exit was large and ragged. He had obtained a leave of absence, and as I saw him incidentally, he requested me to dress his wound before starting for his home. On examination, I found many fragments of bone lying irregularly in the wound, and recommended him to remain and have them removed. May 14th, being well etherized, the wound of exit was enlarged upward and downward and about twenty fragments of bone of different sizes were removed. The oblique points of the upper and lower portions of the radius were excised by the chain saw. The space left measured about two and a half inches. No vessel required ligating, and very little blood was lost. The fresh-cut extensions of the wound were approximated and secured by pins, two above and one below the original wound. 20th, he has suffered no pain since the operation, from which he was scarcely free a moment before. There is considerable swelling of the whole forearm; no union under the pins, and they were to-day removed. 25th, forearm considerably swollen, and œdematous around the elbow. About three o'clock P. M. some hæmorrhage occurred, which soon ceased. 28th, about five o'clock P. M. hæmorrhage commenced profusely, a steady stream of arterial blood, of the size of a crow's quill, pouring forth from the larger wound, some blood flowing also from the smaller wound (that of the entrance). The nurse (a woman) compressed the brachial artery with her fingers until a Lieutenant, who happened to be in the house, applied a Lambert's tourniquet. The loss of blood was estimated at from fifteen to twenty ounces. The tourniquet was continued on the arm, but loosened so as to allow of distinct pulsation of the radial artery at the wrist without recurrence of hæmorrhage. 31st, the bowels having become somewhat constipated, he took, this morning, some sulphate of magnesia. The tourniquet has been continued sufficiently tight to diminish the force of the pulse, but not so as to stop it. About five o'clock P. M., while having the first evacuation from the bowels in answer to this morning's laxative, there was a hæmorrhage of one or two ounces, readily checked by tightening the tourniquet. His pulse was 96 per minute, and has been between 90 and 100 constantly since the first hæmorrhage. June 1st, slight hæmorrhage at five o'clock P. M., and again at ten o'clock P. M.; pulse 96. 2d, since May 31st the bowels have been quite loose, and during the night he was up quite frequently to defecate. At half-past two o'clock this morning hæmorrhage again commenced, not profusely but persistently, and could not be controlled by tightening the tourniquet, which now, although very tightly applied, did not stop pulsation at the wrist. The brachial artery was held for a considerable time by the hand; pulse 120. He has suffered much pain, and had full doses of tincture of opium during the night. At ten o'clock A. M., amputation of the arm in its lower third was performed by Surgeon W. Moss, U. S. V. The operation was by double flap of skin, the muscles being cut circularly. He was etherized readily and no unpleasant symptom was manifested. The brachial artery was held by the hand, and there was no hæmorrhage other than venous from the part removed. The brachial artery and three branches were ligated. The wound was left open and exposed to the air until four o'clock P. M., when the flaps were nicely coaptated and held by strips of ichthyocolla plaster simply. 7th, the stump has nearly all healed by first intention, there being only slight dripping from the inner angle of the wound, where the free ends are brought out. He has been somewhat restless part of the time and has taken tincture of opium. He has also taken compound tincture of cinchona with the addition, during the last two days, of a few drops of tincture cantharides. 8th, during the night has been very restless, and occasionally delirious. All medicines were omitted, and he was soothed by being held by the hand gently and quietly spoken to. 13th, he has steadily continued to improve, taking no medicine except occasionally a dose of tincture of opium to check the diarrhœa, which has persisted but has not been severe. 18th, gaining finely. The ligature of the brachial artery and two of the others have come away to-day. 19th, the last ligature came away; discharge small in quantity but slightly bloody. 22d, he is feeling very well; got a leave of absence for thirty days, and started for his home." The specimen, represented in the cut (Fig. 699), consists of the bones of the forearm, and shows a space of excision of several inches in the radius. The excised extremities are necrosed, and periosteal disturbance is observable in the ulna opposite the seat of injury. The majority of the excised fragments are mounted with the specimen. The other specimen consists of a wet preparation of the soft tissues of the elbow, showing a false aneurism of the common interosseous, the injury, which is seated near the bifurcation, being due to a fragment of bone which is still embedded in the part. (*Cat. Surg. Sect.*, 1866, p. 456, *Spec.* 1190.) Captain Meyer was mustered out November 12, 1863, and entered the Veteran Reserve Corps several weeks afterward. He was discharged from service March 24, 1866, and pensioned. In his application for commutation, in 1870, he reported the stump as in good condition. The pensioner was paid September 4, 1875.

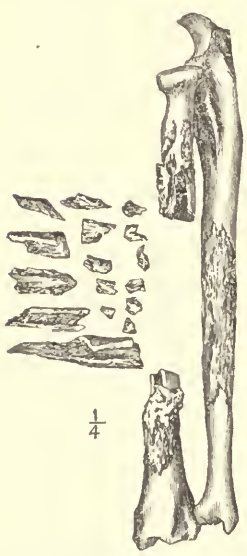

Fig. 699.—Bones of right forearm. Three and a half inches of radius excised. *Spec.* 1189.

The extremity involved,[1] the dates of injury and of operation, the name of the operator, the complications, and the immediate and remote results are noted as far as practicable in the subjoined numerical statement.

[1] Of the 64 excisions in the shaft of the ulna, 34 were on the right, and 30 on the left side. Of the 47 excisions in the radius, 18 were on the right, 27 on the left, and 2 unspecified. Of the 9 cases of excision in the shafts of both ulna and radius, 5 were on the right side, and 4 on the left.

TABLE CXXVIII.

Summary of One Hundred and Twenty Cases of Recovery after Intermediary Excisions in the Bones at the Forearm for Shot Injury.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Ayers, C. D., Pt., I, 6th Ohio Cav., age 18.	May 7, 13, '64.	Three, lower, left radius; by A. A. Surg. O. P. Sweet. Duty Nov. 22, 1864; pensioned
2	Barry, T., Pt., K, 8th N. Y. H. A., age 25.	May 19, June 1, 1864.	Portion right ulna; by A. A. Surg. F. G. H. Bradford: erysip. Duty Nov. 25,'64; pens'd; cart. union.
3	Barter, P., Pt., D, 31st Maine, age 53.	Aug. 16, Sept. 12, 1864.	Three, middle, left ulna; by A. Surg. C. Wagner, U. S. A.; necro. To V. R. C. May 11,'65; partial anchy. elb.; hand half disabled.
4	Bourns, T., Pt., H, 5th Mich. Cav., age 18.	June 9, July 4, 1864.	One and a half, middle, left ulna; by A. A. Surg. P. C. Porter. Dis. July 5, 1865; no bony union.
5	Bowton, C. F., Pt., I, 3d Michigan, age 22.	May 5, 11, '64.	Lower, right ulna; by A. A. Surg. S. Graham. Disch'd June 19, '64; pens'd; ligamentous union.
6	Boyce, W. D., Pt., I, 124th N. Y., age 37.	Oct. 27, Nov. 1, '64	See CASE 1907, p. 953. *Spec.* 4235.
7	Bradford, W. B., Pt., I, 20th Maine, age 24.	May 5, 20, '64.	Three, right radius, middle. Discharged March 2,'65; pensioned; useful limb. *Spec.* 2297. See CASE 1913, p. 955.
8	Bran, J. G., Pt., G, 20th Maine, age 29.	Sept. 30, Oct. 12, 1864.	Portion left radius and fragments; by A. A. Surg. W. C. Mulford. Discharged May 20, 1865.
9	Brohl, M., Corp'l, A, 5th Michigan, age 23.	May 3, 11, '63.	Two, upper, left radius. Duty Sept. 2, 1863; arm partially stiff. Not a pensioner.
10	Brooks, J. B., Lieut., I, 4th Vermont, age 24.	May 6, 17, '64.	Lower, right ulna; by A. A. Surg. J. M. McCalla. Disch'd Aug. 5, '64; pensioned; arm impaired.
11	Brown, C., Pt., E, 42d Illinois, age 20.	Nov. 30, Dec. 6, 1864.	Three, lower, left ulna; by A. A. Surg. J. C. Thorpe. Duty Mar. 14, 1865. Not a pensioner.
12	Brown, J., Pt., B, 52d Ohio, age 23.	May 11, June 1, 1864.	Four, middle, left ulna; by A. A. Surg. A. D. White (rad. fract.); Disch'd June 14,'65; pen'd; 1866, rad. united, curved outward; no rotation; imperfect grasp.
13	Brown, M. A., Pt., B, 148th Pa., age 28.	July 2, 11, '63.	Two, middle, left radius. To V. R. C. May 12, 1864; pensioned; carpus sub-luxated and no motion of wrist or fingers.
14	Cambe, S., Pt., A, 40th Indiana, age 23.	Dec. 31, 1862, Jan. 18, 1863.	Fragments and upper thirds radius and ulna; by Surg. L. Swift, U. S. A.; June 18, amputation forearm. Disch'd Nov. 16, 1863.
15	Carney, J., Pt., B, 2d Massachusetts.	Sept. 17, Oct. 1, 1862.	Two, middle, left radius; by A. Surg. C. Bacon, U. S. A. Disch'd Dec. 24, 1862; pensioned; great distortion of forearm.
16	Casey, M., Pt., D, 36th New York.	June 25, 30, '62.	Two, middle, right ulna; by Asst. Surg. S. A. Storrow, U. S. A. Disch'd July 24,'62. Re-enlisted Dec. 5,'67; pens'd; rotation fair.
17	Cheney, D. J., Pt., A, 2d Massachusetts, age 39.	May 2, 7, '63.	Three, left ulna; by A. Surg. C. H. Lord, 102d N. Y. Disch'd Dec. 30, '63. In 1870, amp. forearm; pensioner. *Spec.* 1152.
18	Clark, W. H., Pt., D, 1st Delaware, age 25.	Sept. 17, 21, '62.	Five of ulna, two and a half of radius, left, middle; by Surg. H. S. Hewit, U. S. V.; gang.; Feb. 28, rotation limited. Disch'd Mar. 13, 1863; pensioned.
19	Cobb, D. B., Serg't, H, 118th Pa., age 20.	July 1, 22, '64.	Four, upper, right ulna; by A. A. Surg. W. P. Moon: Sept. 28, large extoliation removed. To V. R. C. Feb. 6,'65; pens'd; shaft of ulna gone; moderate use. *Spec.* 3614.
20	Cooper, J. B., Pt., D, 122d Ohio, age 28.	May 31, J'e 17, '64.	See CASE 1909, p. 959.
21	Crosby, E. S., Pt., K, 1st Maine Heavy Artillery, age 23.	June 18, 26, '64.	Three, middle, left rad.; by Surg. O. A. Judson, U. S. V. Disch'd Jan. 8,'65; pens'd; hand dislocated; cannot flex fingers.
22	Dean, C. H., Pt., H, 2d Massachusetts Cavalry, age 20.	Aug. 24, Sept. 12, 1864.	Four, upper, right ulna. To V. R. C. Feb. 4, 1865; pens'd; radius dislocated; extreme atrophy.
23	Denneston, J. F., Lieut., E, 70th New York, age 24.	May 5, 19, '62.	Portion of right radius and ulna. Disch'd Apr. 29,'64; pens'd; entirely useless (subsequent fract. and amp. foot; re-amp. leg).
24	Enos, J. H., Pt., B, 35th New York, age 32.	Aug 30, Sept. 10, 1862.	Six, right ulna; by Surg. J. Bryan, U. S. V. Disch'd Nov. 11,'62; pens'd; elbow dislocated; wrist stiff; some use of hand.
25	*Evans, G. G.*, Serg't, K, 44th Alabama, age 26.	July 6, 31, '64.	Five, right ulna and portion of radius. Ret'd Mar. 1,'65; complete anchyl. elb.; loss of use of hand.
26	Fink, H., Pt., B, 26th Wisconsin, age 23.	May 2, 16, '63.	One and a half, middle, right radius; by Surg. N. Hayward, 20th Mass.; gang.; spic. remov'd. To V. R. C. Mar. 10,'64; pens'd; disloc. hand; cannot close fingers.
27	Fitchett, C., Pt., A, 11th Pennsylvania Cavalry, age 18.	Aug. 26, Sept. 17, 1864.	Five and a half, upper, right ulna; by A. A. Surg. W. P. Moon (necrosis). Disch'd Jan. 20, 1865. Not a pensioner.
28	Flint, I. B., Pt., K, 1st Massachusetts Artillery, age 21.	May 18, 28, '64.	One, middle, right radius; by A. A. Surg. L. K. Baldwin; hæm.; lig. radial. Duty Feb. 16, 1865; pensioned; necrosis; deformity. Died February 18, 1868.
29	Flora, J. C., Pt., C, 4th Michigan, age 32.	July 2, 25, '63.	Four, middle, right ulna by Surg. H. Palmer, U. S. V. Disc'd June 29, 1864; pensioned; anchylosis of elbow; general atrophy.
30	Frank, E., Pt., H, 78th Pennsylvania, age 22.	Dec. 31, '62 Jan. 4, 1863.	Four, upper, ulna. Disch'd May 1, 1863; pensioned; no rotation; hand cold and useless.
31	French, L. W., Pt., M, 1st Maine Heavy Artillery, age 31.	May 19, 29, '64.	Two, lower, left radius; by A. A. Surg. W. C. Mulford (w'd, right arm). Disch'd Dec. 3,'64; pen'd; hand paralyzed and cold.
32	Fulton, A., Pt., A, 93d New York, age 20.	May 6, 14, '64.	Three, lower, left radius; by A. A. Surg. J. O. French. Disch'd Dec. 19,'64; pens'd; disloc carp. end of ulna; hand useless.
33	*Greer, J. B.*, Pt., K, 41st Mississippi, age 26.	Dec. 31, F'y 10,'63.	Three, lower, radius. To prison March 20, 1863.
34	Griffith, J., Pt., M, 102d Penn., age 35.	May 5, 21, '64.	Middle, left ulna; by Surg. N. R. Moseley, U. S. V. Disch'd Sept. 3, '64; pens'd; almost useless. *Spec.* 2320.
35	Hahn, F., Pt., C., 20th Massachusetts, age 19.	July 1, 5, '63.	Portion of middle, right radius. Duty Nov. 16, 1863.
36	Hamratty, J., Pt., D, 69th N. Y. age 27.	July 29, Aug. 3, 1863.	Two and a half, lower, left rad. Disch'd Feb. 13, '64; pens'd; atrophy arm and shoulder.
37	Havey, D. P., Pt., I, 19th Mass., age 19.	June 30, July 10, 1862.	Four, right ulna. Disch'd Sept. 17, '62; pens'd; forearm greatly impaired; fingers contracted.
38	Herbst, W., Pt., E, 50th Penn., age 19.	May 6, 14, '64.	Two, middle, left ulna; by A. Surg. H. Allen, U. S. A.; erysipelas. Disch'd Jan. 22, 1865.
39	Hill, T. A., Pt., D, 120th New York, age 30.	Oct. 27, No. 4, '64.	One and a half, upper, left radius; by A. Surg. H. Allen, U. S. A. Disch'd Feb. 20, 1865.
40	*Hodges, J. J.*, Lieut., C, 9th Louisiana, age 24.	July 9, 27, '64.	Lower, right ulna; by Surg. Todd, C. S. A.
41	Holland, J., Pt., A, 137th New York, age 34.	July 2, 21, '63.	Three, middle, right ulna; by Surg. J. A. Wolfe, 29th Penn.; Aug. 8th, amp. arm. Disch'd Oct. 19, 1863; pensioned.
42	Irwin, R. B., Pt., A, 51st Ohio, age 27.	Dec. 16, 24, '64.	Four, right ulna, by A. A. Surg. A. Rolls. Disch'd June 2, 1865; pens'd; anchyl. and paralysis.
43	Jackson, S., Corp'l, D, 21st Ohio.	July 9, 15, '64.	Three, lower, right radius. Discharged Feb. 28, 1865.
44	Jenkins, J., Pt., C, 3d N. Y. Cav.	Mar. 14, April 3, 1865.	Four and a half, middle, left ulna, with fragments; by Surg. J. L. Van Alstyne, 3d N. Y. C.; amp. arm Sept., '65. Disch'd Dec. 5, 1865; pensioned.
45	Johnson, W. D., Pt., K, 100th Penn., age 43.	June 2, 10, '64.	Four, lower, left ulna, with fragments; by Surg. O. A. Judson, U. S. V. Disch'd June 29, '65; pens'd; bony union; no rotation.
46	Jones, C. P., Corp'l, D, 5th Wisconsin, age 26.	May 3, 11, '63.	One and a half, lower, left radius. Disch'd Nov. 10, 1863; pen'd; ulna disloc.; wrist anchyl.
47	Jones, W. F., Corp'l, E, 12th Infantry.	June 27, Jul. 19, '62	Lower, left ulna. Disch'd Sept. 16, '62. Not a pensioner.
48	Jordan, G., Pt., C, 17th Ohio, age 20.	Sept. 20, Oct. 4, '63.	Six, upper, right ulna. Disch'd May 6, '64; pens'd; arm useless.
49	Kent, E. B., Pt., A, 6th Vermont, age 21.	May 6, 16, '64.	Three, right ulna; by A. A. Surg. F. Hall. To V. R. C. Dec. 14, 1864; pens'd; wrist distorted; no bony union; atrophy.
50	Kelly, J. W., Pt., H, 6th Kentucky, age 19.	Sept. 19, Oct. 4, '63.	One and a half, right rad. Duty. Died Oct. 24, '64, acute dysentery.
51	*Killian, W. M.*, Pt., H, 11th Alabama.	July 2, 8, '63.	Three, upper, ulna. Furloughed August 26, 1863.
52	Koenig, W., Pt., E, 119th N. Y., age 25.	Dec. 2, 9, '62.	Half inch from end, upper, right ulna; by Surg. A. Wyncoop, U. S. V. Discharged April 3, '63; pensioned; atrophy and deformity. Died August 18, 1874.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
53	Lang, W., Pt., K, 1st Maine Cav., age 25.	June 24, July 15, 1864.	Middle, left ulna, and fractured ends; by A. Surg. T. Artand, U. S. V. Disch'd Feb. 24, '65; pensioned; no bony union; atrophy.
54	Leasure, J. G., Pt., D, 138th Pa., age 22.	June 2, 13, '64.	Four, lower, left radius; by A. A. Surg. W. E. Sparrow. Disch'd February 10, 1865; pensioned; anchylosis; deformity; useless.
55	Lefevre, J., Corp'l, H, 28th Pa., age 28.	Sept. 17, 18, '62.	See Case 1908, p. 954. *Spec.* 823.
56	Little, J. C., Pt., G, 21st Wisconsin, age 19.	Oct. 8, 20, '62.	Three, lower, left ulna; by Surg. W. Varian, U. S. V. Disch'd Dec. 4, 1862; pensioned; partial anchylosis elbow; use impaired.
57	Lucas, C., Corp'l, C, 16th New York, age 22.	May 3, 11, '63.	Five, middle, left radius. Disch'd May 22, 1863; pens'd; no bony union; anchyl. elb.; hand useless.
58	Lupton, H. R., Serg't, B, 126th Ohio, age 27.	July 9, 27, '64.	Three and one-fourth, middle, left, both bones; by A. A. Surg. A. V. Cherbonnier. Disch'd Mar. 27, 1865; pensioned; limb deformed.
59	Luse, J. B., Pt., C, 125th Ohio, age 22.	July 18, 23, '64.	Three and a half, upper, right radius; by A. A. Surg. H. S. Kilbourne; August 2, amp. arm. Disch'd April 11, '65; pensioned.
60	Mack, E., Pt., D, 138th Pennsylvania, age 25.	June 2, 13, '64.	Three and a half, lower half, left radius; by A. A. Surg. W. E. Sparrow. Disch'd Feb. 10, '65; pensioned; ulna displaced; hand badly deformed.
61	Masland, J. W., Serg't, F, 23d Pa., age 23.	June 1, 10, '64.	Three, lower, left ulna; by A. A. Surg. P. Wilson. Disch'd Sept. 8, '64; pen'd; lig. union; no grasp.
62	Matthewson, A., Pt., A, 2d Pa. Heavy Artil'y, age 50.	June 16, 23, '64.	Two and a half, lower, right rad.; by A. A. Surg. S. Coloosdian. Disch'd March 4, '65; pensioned; anchylosis; deformity of wrist.
63	Matthews, W. E., Serg't, C, 4th C. T., age 28.	Sept. 29, Oct. 19, 1864.	Two and a half, lower, right ulna; by A. A. Surg. C. C. Ela. Discharged June 26, '65; pensioned; no rotation; adherent cicatrix.
64	Maury, L., Corp'l, E, 2d Pennsylvania Cavalry, age 21.	June 24, July 4, 1864.	Two and a half, lower, right radius; by A. Surg. T. Artand, U. S. V. Mustered out Nov. 6, 1864; pensioned; limb useless.
65	McCartney, R., Pt., K, 124th N. Y., age 41.	May 3, 11, '63.	Fragments and ends from lower, right ulna. To V. R. C. May 5, '64.
66	*McCoy, H. J.*, Lieut., K, 33d N. C., age 29.	May 3, 13, '63.	Four, upper, left ulna. Furloughed Sept. 17, 1863.
67	McNealy, J., Pt., C, 93d New York, age 21.	May 5, 11, '64.	Two, middle, left radius; by A. A. Surg. W. E. Clark. Disch'd Apr. 13, '65; flex. and rota. imp'd. See Case 1914, p. 956. *Specs.* 1189 and 1190.
68	Meyer, J. H., Capt., G, 11th New Jersey.	May 3, 14, '63.	Three, upper, left ulna; by A. A. Surg. W. H. True. Drowned November 11, 1864.
69	Mills, N. M., Serg't-Maj., 1st Me. H. A., age 20.	June 18, 30, '64.	Two, lower, right ulna. Disch'd Sept. 5, 1864; pensioned; no rotation; cannot flex fingers.
70	Milner, W., Lieut., K, 1st New Jersey, age 23.	June 3, Interm'y, 1864.	Three, upper, left ulna; by A. Surg. H. Allen, U. S. A. Disc'd Mar. 21, '65; pens'd; anchy. elb.; wrist swollen; limb useless.
71	Morian, S., Pt., C, 8th New Jersey, age 25.	Oct. 27, Nov. 4, 1864.	Four, middle, left ulna; by Surg. G. L. Pancoast, U. S. V. Disc'd Aug. 3, '65; pens'd; paral.; atrophy. Died Feb. 18, '67. *Spec.* 4285.
72	Morony, J., Pt., C, 94th New York, age 43.	Mar. 31, April 14, 1865.	Three and a half, upper, left ulna; by Surg. J. C. Derr, U. S. V. Dis. Sept. 12, '62; hand nearly useless.
73	Morris, J., Pt., I, 9th Massachusetts, age 26.	July 1, 8, '62.	Three, lower, right radius; by A. Surg. W. S. Ely, U. S. V. Dis. Feb. 6, 1865; pensioned; anchylosed wrist; fingers extended.
74	Murdock, J. C., Serg't, C, 122d Ohio, age 36.	July 9, 13, '64.	Four, lower half, left radius (fracture humerus; amp. right arm). Retired January 25, 1865.
75	*Nelson, J. B.*, Pt., B, 33d North Carolina, age 28.	May 3, 11, '63.	Half inch and frag's lower, right ulna (radius fract.). Duty Sept. 20, '62; pen'd. Died Dec. 20, '70.
76	Noonan, J., Serg't, G, 14th Infantry, age 30.	June 27, July 15, 1862.	See Case 1912, p. 955. *Spec.* 2480.
77	Painter, S., Pt., K, 122d Ohio, age 33.	May 12, 24, '64.	Portion lower, left ulna; by A. Surg. H. Allen, U. S. A. Disch'd Feb. 27, 1865; necrosis both bones; open sore; no rotation.
78	Quinn, F., Pt., H, 124th New York, aged 25.	Oct. 27, Nov. 3, 1864.	Necrosed portion and spicula lower, left ulna. Disc'd Dec. 13, '62; pens'd. anchy. fingers and wrist.
79	Raymond, W., Pt., D, 8th Ohio, age 29.	Sept. 17, Oct. 9, 1862.	Five, lower right radius; by Surg. D. Merritt, 55th Pa. Disch'd Dec. 11, '63; pens'd; arm deform.; hand almost useless. *Spec.* 1880.
80	Rayner, J. B., Pt., E, 48th N. Y., age 18.	July 18, Aug. 14, 1863.	See Case 1911, p. 955. *Spec.* 338.
81	Rees, R., Pt., A, 105th Ohio, age 29.	Oct. 8, 22, '62.	
82	Rhein, G., Pt., K, 1st Wisconsin, age 32.	May 28, June 3, 1864.	Two, lower, right ulna; by A. A. Surg. G. E. Stubbs; gangrene. Disch'd Nov. 20, 1865; pens'd; fingers almost immovable.
83	Rheads, H. C., Pt., C, 138th Pa., age 24.	June 3, 15, '64.	Three, left radius; by A. A. Surg. D. G. Caldwell. To V. R. C. Jan. 18, 1865; pens'd; carpal end ulna luxated; grasp impaired.
84	Robbins, R. B., Major, 4th Michigan Cavalry, age 31.	May 18, June 1, 1864.	Three, lower, left ulna; by Surg. J. E. Herbst, U. S. V. Duty Oct. 20, 1864; pens'd; paralysis; partial loss of use of hand.
85	Roberts, A. N., Pt., L, 7th New York Heavy Artillery, age 27..	June 3, 9, '64.	Three, middle, left ulna; by Surg. J. S. Wentz. Disch'd Nov. 19, 1864; pensioned; no bony union; limb impaired.
86	Root, E. C., Lieut., D, 2d New York Artillery, age 29.	May 19, 29, '64.	Two and a half, upper, left radius; by A. A. Surg. J. O. Stanton; hæm.; lig. and re-lig. brachial. Dismissed January 25, 1865.
87	Ryan, J., Pt., K, 45th Pennsylvania, age 22.	Sept. 17, 24, '62.	Two and a half, middle, left radius; by Surg. H. S. Hewit, U. S. V. Dis'd Dec. 19, '62; pens'd; imp'd.
88	Sage, J. W., Pt., F, 75th Indiana, age 22.	Sept. 19, Oct. 19, 1863.	One, lower and middle, left ulna. Disch'd June 30, 1865; pens'd; no rotation; hand weak.
89	Schmidt, E., Pt., C, 28th Kentucky.	June 11, 18, '64.	Upper, left ulna; by Surg. E. B. Glick, 40th Ind. To V. R. C. Dec. 27, 1864. Not a pensioner.
90	*Scott, J. D.*, Serg't, D, Cobb's Legion, age 27.	Oct. 11, Nov. 3, 1863.	Loose fragments and ends of bone of right ulna, near wrist. Furloughed November 22, 1863.
91	Scott, T. E., Pt., K, 19th Maine, age 26.	July 2, 6, '63.	Portions lower, right radius and ulna. Disch'd Mar. 23, '65; pen'd; no rotation; cannot flex fingers.
92	Shannon, A. J., Pt., F, 55th Ohio, age 25.	May 15, June 13, 1864.	Three, upper, left ulna. Disch'd Oct. 29, '64; pens'd; partial flexion forearm; fingers contracted.
93	Sheridan, A. A., Pt., E, 13th Illinois, age 29.	Nov. 27, Dec. 3, 1863.	Portion, left radius (ulna fract.); gang. Disc'd June 18, '64; pens'd; dis. ear. end ulna; hand pow'less.
94	Short, W. S., Pt., G, 114th New York, age 19.	Sept. 21, Oct. 18, 1864.	Three, upper, left radius; by A. A. Surg. W. P. Moon. Disch'd Mar. 4, '65; pens'd; disloc. ulna; forearm much deformed.
95	Shumway, W., Pt., K, 8th Michigan, age 20.	May 6, 13, '64.	Three, middle, right rad.; by Surg. W. B. Fox, 8th Mich.; gangrene. Disch'd Aug. 25, '65; pensioned; anchylosis of elbow; carpal end of ulna displaced.
96	Smith, G. P., Serg't, C, 68th Pennsylvania, age 38.	May 3, 15, '63.	Four, upper, right ulna; fragments removed. Disch'd Mar. 8, 1864; fingers semiflexed.
97	Spedel, C., Serg't, E, 74th Pennsylvania, age 29.	May 21, June 6, 1864.	Two-thirds lower, left radius; by A. A. Surg. W. Baker. Disch'd Aug. 22, '64; pensioned; anchylosis of wrist; hand turned inward and paralyzed.
98	Stevens, D. W., Corp'l, G, 122th N. Y., age 21.	May 5, 31, '64.	One and a half, lower, left radius; by A. A. Surg P. C. Price; erysip. Disch'd Jan. 16, '65; anchyl. wrist; flex. fingers imperf't.
99	Steves, E. O., Serg't, B, 165th N. Y., age 23.	April 7, 19, '64.	Two, right radius; by Surg. F. Bacon, U. S. V. Duty Sept. 16, '64. pens'd; ulna disloc. at wrist.
100	Stewart, J., Serg't, C, 12th Iowa, age 27.	July 14, 22, '64.	Two, middle, left radius; by A. A. Surg. R. W. Coale. Disch'd May 20, '65; pens'd; entire loss of use of limb; great deformity.
101	*Swairington, T. C.*, Pt., H, 8th La., age 30.	July 9, 13, '64.	Portion radius; by A. A. Surg. J. Goldsborough. Exchanged September 19, 1864.
102	Sweeny, H., Pt., E, 121st N. Y., age 18.	May 3, 10, '63.	Two and a half, lower, right ulna (fract. radius); necrosed radius removed. Disch'd Nov. 2, '63; pens'd; anchyl. wrist; fingers cold and stiff.
103	Sylvis, J., Corp'l, D, 21st Ohio, age 37.	July 9, 14, '64.	Two and a half, upper, right rad.; by A. A. Surg. G. E. Stubbs. Disch'd Feb. 28, '65; pens'd; hand anchyl. right angle; paral.
104	Taft, D. W., Pt., I, 95th N. Y., age 20.	Mar. 31, April 12, 1865.	Two and a half, lower, right rad.; by Surg. G. L. Pancoast, U. S. V.; hæmor.; amp. forearm. Disch'd July 22, 1865. *Spec.* 4284.
105	Tuck, C. H., Pt., F, 17th Maine, age 22.	May 6, 12, '64.	Three, lower, right radius; by A. A. Surg. J. O. French. Disch'd Dec. 29, 1864.
106	Voltz, G., Pt., B, 1st Conn. Cav., age 26.	April 6, 22, '65.	Two, middle, right ulna; by Surg. G. L. Pancoast, U. S. V. Disch'd July 28, '65; pens'd; no bony union. *Spec.* 4286.
107	Walker, W. H., Serg't, D, 7th Wis., age 32.	Mar. 31, April 12, 1865.	One and a half, middle, left rad.; by Surg. G. L. Pancoast, U. S. V. Disch'd July 31, '65; pens'd; anchylosed at 45°. *Spec.* 4283.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
108	Watkins, A. J., Pt., B, 191st Penn., age 32.	May 31, June 24, 1862.	Four, lower, left ulna. Disch'd July 7, '62; pens'd; useless for heavy work.
109	Warner, D., Pt., A., 155th Pa., age 26.	June 18, 27, '64.	Four, lower, right radius. Disch'd July 27, '65; pens'd; no rotation: hand drawn in w'd, much impa'd.
110	Warren, J. H., Serg't, A, 4th C. T., age 25.	Sept. 29, Oct. 25, 1864.	Four and a half, middle, right ulna; by A. A. Surg. O. Warner. Disch'd April 1, '65; pens'd: hand nearly useless.
111	Weber, W., Pt., B, 114th Penn., age 34.	May 3, 10, '63.	Three, upper, left ulna. To V. R. C. Sept. 9, 1863; pens'd; atrophy; radius subluxated.
112	Weidner, M., Pt., B, 93d Penn., age 20.	May 6, 12, '64.	Two, lower, right ulna; by A. Surg. H. Allen, U. S. A.; erysip. Disch'd Jan. 27, '65; pens'd; deformity; limb much weaken'd.
113	Whalen, T., Pt., D, 88th N. Y., age 63.	June 5, 12, '64.	Three, left ulna; fever; amp. arm. Recovered. Died May 29, '65, cancer of liver.
114	Wheeler, C. C., Pt., D, 6th Vt., age 21.	May 6, 15, '64.	Two and a half, left radius and ulna, middle thirds; by A. A. Surg. R. E. Price.
115	*Wolfong, S. T.*, Serg't, A, 14th N. C., age 19.	May 3, 11, '63.	See Case 1910, p. 954. Exch'd June 25, '63. *Spec.* 1089.
116	*Wolfe, S. C.*, Pt., A, 28th Tenn., age 24.	Feb. 12, 25, '65.	Three, lower, right radius and ulna; by A. A. Surg. W. J. Holmes. To Provost Marshal May 6, 1865.
117	Wilkse, M. H., Pt., G, 1st Sharpsh'rs, age 25.	May 3, 9, '63.	Three and a half, upper, r'l ulna; by Surg. T. Antisell, U. S. V. May 26, lig. brachial; Sept. 20, necro. rad. rem'd. Disch'd Jan. 11, 1864; pens'd; limited anchylosis wrist, cannot flex fingers.
118	Witt, E., Pt., A, 187th N. Y., age 43.	Oct. 27, Nov. 18, 1864.	Three, lower, left radius. Disch'd May 26, '65; pens'd; anchyl. wrist at 15°; utterly useless.
119	Wood, D. T., Serg't, K, 64th N. Y., age 32.	July 3, 29, '63.	Two, lower, right ulna (lig. ulnar). Disch'd Dec. 21, '63; pens'd; no motion of wrist; immobility of fingers.
120	Wood, S., Pt., G, 121st Ohio, age 18.	June 27, July 11, 1864.	Two, upper, right ulna: by A. A. Surg. J. G. Harvey; part. paral. Disch'd May 17, '65; pens'd; false anchylosis of elbow.

§ *Fatal Intermediary Excisions in the Forearm.*—Twenty-nine of the hundred and forty-nine intermediary operations resulted fatally, mainly from pyæmic complications:[1]

Case 1915.—Private G. W. Wilcox, Co. I, 57th Massachusetts, aged 25 years, was wounded at Spottsylvania, May 19, 1864, and sent to Emory Hospital, Washington, where Surgeon N. R. Moseley, U. S. V., reported: "Admitted May 22, 1864, from the field. Gunshot wound of left forearm. A minié ball passed from without inward through middle third, lacerating the flesh and fracturing the radius at middle third. On May 23d, Acting Assistant Surgeon W. H Ensign excised the radius at middle third, chloroform and ether being used as anæsthetics. At the time of the operation the limb was swollen, but the constitutional state of the patient was favorable. Splints and bandages were applied to the limb and cold-water dressings to the wound. On May 31st, erysipelatous inflammation set in with a tendency to gangrene. After the occurrence of erysipelas, carron oil and a solution of sulphate of copper were used externally, and stimulants and anodynes were administered internally. The patient died June 11, 1864, of pyæmia." The specimen, represented in the adjoining wood-cut (Fig. 700), was contributed to the Museum by Dr. Moseley. It is described as "fragments, representing about one inch of the shaft of the radius, removed by operation."

Fig. 700.—Fragments of left ulna excised.—*Spec.* 2350.

Fig. 701.—Pieces of left ulna excised for shot injury.—*Spec.* 2296.

Case 1916.—Sergeant P. Welsh, Co. K, 28th Massachusetts, aged 32 years, was wounded at Spottsylvania, May 12, 1864, and sent from a Second Corps field hospital to Washington, where Surgeon O. A. Judson, U. S. V., reported: "Admitted to Carver Hospital, May 14, 1864. Gunshot wound of left forearm, by a conoidal ball, producing compound comminuted fracture of inferior third of left ulna. On May 17th, Acting Assistant Surgeon J. S. Wentz excised three inches of the shaft of the ulna through a straight incision; no ligatures were applied; the ball was also extracted. The constitutional state of the patient at time of operation was good. On May 20th, secondary hæmorrhage occurred, apparently from the interosseous artery, but ceased spontaneously. On the 24th, rigors and other pyæmic symptoms appeared, and the patient died May 28th, 1864, from pyæmia." The specimen, represented in the adjoining wood-cut (Fig. 701), was contributed to the Museum by Dr. Judson. It consists of "four pieces of bone, representing three inches of the left ulna, excised; a conoidal ball, exceedingly battered, distorted, and grooved, is mounted with the specimen."

Case 1917.—Private John Shupe, Co. D, 155th Pennsylvania, age 18 years, was wounded at the South Side Railroad, October 27, 1864, and sent from a Fifth Corps field hospital to Washington. Surgeon N. R. Moseley, U. S. V., reported: "Admitted to Emory Hospital October 30, 1864. Gunshot wound of left forearm, with compound comminuted fracture of radius. November 2d, excision of about three inches of radius from lower third upward, through an incision about five inches in length; ball also extracted; anæsthetic—chloroform. At time of operation the tissues were very much inflamed and lacerated, the radius comminuted, and the parts infiltrated with unhealthy pus; the constitutional state of the patient was good. After the operation the parts were left open and dry lint applied; stimulants were given internally, and nourishing diet ordered." The patient died November 6, 1864, from hectic fever. The specimen, represented in the accompanying wood-cut (Fig. 702), was contributed to the Museum by the operator, Dr. Moseley. It is described by Acting Assistant Surgeon J. E. Janvrin, who had charge of the case, as consisting of "the fractured portions of the radius removed during the operation. The larger piece is some two inches in length, and on making the incision was found detached from the shaft of the bone. The small spiculæ were removed from the ends of the fractured bone."

Fig. 702.—Three inches of left radius excised for shot injury. *Spec.* 3412.

[1] Of the 29 patients, 12 died from pyæmia, 2 from pneumonia (?), 3 from hectic or exhaustive suppuration, 1 from diphtheritic infection, 2 from tetanus, 1 from gangrene, 2 from abdominal complications, not reported, 6.

None of the twenty-nine fatal intermediary excisions interested both bones; eighteen were in the shaft of the ulna, eleven in the shaft of the radius.[1]

CASE 1918.—Captain J. S. McCready, Co. H, 126th Ohio, aged 35 years, was wounded at Spottsylvania, May 10, 1864, and admitted to Emory Hospital, Washington, on the 17th. Surgeon N. R. Moseley, U. S. V., reported: "Gunshot wound of left forearm at middle third; a minié ball passed from without inward, fracturing the ulna and lacerating the radial artery. May 19th, secondary hæmorrhage occurred from radial artery, which rendered ligation necessary; ten ounces of blood lost. 20th, hæmorrhage recurred; temporarily arrested by compression; eight ounces of blood lost. Surgeon Moseley ligated radial artery at cardiac and at distal extremities, and also resected four inches of ulna at middle third. Constitutional state of patient at time of operation favorable; arm kept *in situ* by splint and roller. June 1st, patient doing well; hæmorrhage has not recurred. 15th, pyæmia set in; hæmorrhage recurred, eight ounces of blood lost. 22d, four ounces of blood lost; tonic and stimulant treatment. 27th, eight ounces of blood lost; patient still suffering from pyæmia. Hæmorrhage again recurred on the 6th of July; radius and remaining portion of ulna necrosed; soft parts much swollen; sinuses extending to elbow with discharge of dark ichorous pus. Flap amputation of arm at middle third by Surgeon N. R. Moseley, U. S. V.; anæsthetic—sulphuric ether. At time of operation patient much reduced from loss of blood and excessive discharge from wound; pulse 110, weak. Nausea and hiccough, with extreme nervous prostration; treatment, tonics and stimulants with nutritious diet; adhesive straps and cold-water dressings; wound granulating healthily, with copious discharge of laudable pus until July 24th, when the discharge ceased; applied flaxseed poultices. July 31st, discharge reappearing and patient gradually improving." This officer was transferred to the care of Surgeon Thomas Antisell, U. S. V., August 4th, and on the 19th was granted a leave of absence for thirty days to visit his home in Ohio. Surgeon Antisell noted: "Died September 7, 1864, of wounds received in battle." The specimen, represented in the adjoining wood-cut (FIG. 703), was contributed to the Museum by the operator, Dr. Moseley. It consists of "the bones of the left forearm. Three and a half inches from the lowest third of the ulna appears to have been excised. The extremity of the lower fragment is carious, and the upper portion of the shaft is necrosed nearly to the olecranon. A small portion of the inner border of the radius has been absorbed as if after contusion."

FIG. 703.—Excision of 3½ inches of ulna. *Spec.* 2810.

CASE 1919.—Private R. Johnson, Co. C, 6th New York Heavy Artillery, aged 18 years, was wounded at the battle of the Wilderness, May 18, 1864, and admitted to Emory Hospital, Washington, on the 22d. Surgeon N. R. Moseley, U. S. V., reported: "Gunshot wound of right forearm. A minié ball passed through from posterior to anterior surface of middle third, producing compound comminuted fracture of the radius. Excision of middle third of radius June 2, 1864, by Surgeon N. R. Moseley, U. S. V.; chloroform and ether used as an anæsthetic. At time of operation the soft parts were lacerated and sloughing; constitutional state of patient favorable. After treatment: cold-water dressings, stimulants, and nutritious diet. June 8th, dysentery set in: patient not doing well: result: died June 19, 1864." The excised portion of the radius, represented in the adjoining wood-cut (FIG. 704), was contributed to the Museum by Dr. Moseley. The specimen shows a loss of substance corresponding to the calibre of the bullet.

FIG. 704.—Excis'd portion radius. *Spec.* 2508.

CASE 1920.—Private J. Sullivan, Co. G, 49th New York, was wounded at the battle of Bull Run, August 30, 1862, and admitted to Harewood Hospital, Washington, September 5th. Surgeon T. E. Mitchell, 1st Maryland, noted: "Excision of three and a half inches of right ulna, upper third, September 14, 1862, for gunshot compound fracture of forearm." The patient died September 18, 1862. The excised portion of the ulna was contributed to the Museum by the operator, Dr. Mitchell, and is represented in the adjoining wood-cut (FIG. 705). It is described by Assistant Surgeon B. Stone, U. S. V., as "a section of shaft of the right ulna extensively comminuted by the impact of a conoidal musket ball."

FIG. 705.—Excised portion of ulna. *Spec.* 69.

Consecutive amputation of the upper arm was unsuccessfully resorted to in five of the twenty-nine fatal intermediary excisions:

CASE 1921.—Private W. Van Nevil, Co. E, 8th Michigan, aged 14 years, was wounded at Petersburg, June 18, 1864, and admitted to the Ninth Corps field hospital at City Point, June 21st, from a third division field hospital. On June 22d, Assistant Surgeon M. J. Asch, U. S. A., amputated the right arm on account of gangrene following an excision of one inch of the shaft of the right ulna for a shot fracture of the upper third of that bone by a minié ball. On July 1st, the patient was transferred to Washington, and admitted on the 2d to Mount Pleasant Hospital, where Assistant Surgeon C. H. McCall, U. S. A., noted: "Died July 7, 1864, of diphtheria and wounds." The specimen, represented in the adjoining wood-cut (FIG. 706), was contributed to the Museum by Dr. Asch. It consists of "the upper portion of the right ulna from which an excision has been made."

FIG. 706.—Exc'n in ulna. *Spec.* 2985.

In one instance the fatal result was probably mainly due to a concomitant fracture of the spinous process of a dorsal vertebra. Two patients succumbed from tetanus. In one case the brachial artery, in one the radial, in two the interosseous, were tied, either in the course of the operation or later, for consecutive bleeding. The twenty-nine cases are tabulated on the next page.

[1] Excisions were of the right radius in 5 cases, of the right and left ulna in 9 cases, respectively. The extent removed from the radius varied from 1 to 3¾ inches; in the ulna from 1 to 6 inches—in 8 cases from 3 to 4 inches being removed.

TABLE CXXIX.

Summary of Twenty-nine Fatal Cases after Intermediary Excisions in the Bones of the Forearm for Shot Injury.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Burns, J. D., Pt., H, 155th Pa., age 19.	Oct. 27, Nov. 10, 1864.	Two, right ulna, lower: by Surg. O. A. Judson, U. S. V. Died Nov. 30, 1864, pyæmia.
2	Bush, J. M., Pt., F, 57th Pennsylvania, age 49.	May 6, 19, '64.	One and a half, lower, right ulna: by A. Surg. J. Y. Cantwell, U. S. V. Died May 20, 1864.
3	Carr, J. S., Pt., G, 14th New York Heavy Artillery, age 24.	June 18, July 18, 1864.	Upper and lower ends of ulna; by A. A. Surg. W. C. Mulford. Died July 30, 1864, acute diarrhœa.
4	Cornelius, A., Pt., A, 5th New Jersey, age 19.	May 4, 12, '63.	Lower, right ulna; hæmorrhage. Died June 3, 1863, pyæmia.
5	Daniels, W. A., Pt., E, 2d Massachusetts.	Aug. 9, 21, '62.	Upper, left ulna; hæmorrhage; August 25, amputation of arm. Died Sept. 5, 1862, pyæmia.
6	Davidson, J. W., Corp'l, F, 8th Maryland, age 21.	May 5, 13, '64.	Three, lower, right ulna: by Surg. O. A. Judson, U. S. V. Died May 28, 1864, pyæmia.
7	Forbes, B. F., Pt., H, 20th Maine, age 20.	May 5, 15, '64.	Three, middle, right ulna; by A. A. Surg. W. E. Clark. Died May 26, 1864, tetanus.
8	Gochenaur, J., Pt., D, 99th Pennsylvania, age 21.	May 12, 18, '64.	Portion upper, right radius; by A. A. Surg. W. H. Ensign (fracture vertebra). Died May 30, '64.
9	Hughes, F., Capt., E, 37th Indiana, age 37.	June 22, July 9, 1864.	Two, upper, right ulna; by A. A. Surg. J. H. Greene; gang.; irritative fever: July 13, amp. arm. Died July 28, 1864, pyæmia.
10	Ingersol, C., Pt., G, 2d Connecticut Heavy Artillery, age 21.	Sept. 19, 24, '64.	Three, left ulna; by Asst. Surg. F. C. Smith, 116th Ohio. Died September 25, 1864.
11	Johnson, R., Pt., C, 6th New York Heavy Artillery, age 18.	May 18, June 2, 1864.	See CASE 1919, p. 965. Died June 17, 1864. *Spec.* 2508.
12	Lewis, J. B., Pt., A, 32d Maine, age 32.	May 17, 24, '64.	Three, middle, right ulna; by A. A. Surg. R. E. Price; May 30, ligation of interosseous artery. Died June 21, 1864, pyæmia.
13	Loomis, B., Pt., E, 14th Infantry, age 24.	May 5, 17, '64.	Four inches, left ulna: by Surg. A. F. Sheldon, U. S. V. Died May 24, 1864, exhaustion.
14	Lutes, C., Pt., D, 23d Michigan, age 22.	Dec. 3, 7, '64.	One and a half, upper, left radius: by A. A. Surg. M. L. Herr: Dec. 16, amputation of arm. Died Dec. 23, 1864, gangrene.
15	McCready, J. S., Capt., H, 126th Ohio, age 35.	May 10, 20, '64.	See CASE 1918, p. 960. *Spec.* 2810.
16	McGurk, O., Pt., C, 88th New York, age 30.	May 8, 16, '64.	Four, middle, left ulna; by A. A. Surg. R. E. Price; May 25, hæm. from interosseous; ligated. Died June 4, 1864, pyæmia.
17	Price, G. G., Serg't, C, 2d New York Mounted Rifles, age 20.	June 7, 18, '64.	Two and a half, right radius (other wounds). Died June 30, 1864, asthenia.
18	Quigley, E., Pt., C, 95th Pennsylvania, age 20.	May 12, 21, '64.	Lower, right radius; by Surg. N. R. Moseley, U. S. V. Died June 25, 1864.
19	Rees, G. W., Pt., G, 20th Pennsylvania Cavalry, age 22.	April 1, 12, '65.	Two, middle, left radius, and ligated brachial; by A. A. Surg. J. Morris. Died April 26, 1865, pneumonia.
20	Scott, R., Pt., H, 11th Wisconsin.	May 26, June 5, 1863.	Fractured end of right radius, upper third. Died June 15, 1863, tetanus.
21	Sharin, J., Pt., F, 7th Pennsylvania Cavalry, age 35.	June 1, 8, '64.	Two and a half, lower, left ulna; by A. A. Surg. H. S. Kilbourne (gangrene). Died June 13, '64, pyæmia.
22	Shupe, J., Pt., D, 155th Pennsylvania, age 17.	Oct. 27, Nov. 2, '64	See CASE 1917, p. 959. *Spec.* 3412.
23	Sing, P., Pt., I, 74th Pennsylvania.	May 2, 10, '63.	Six, middle, left ulna; hæmor. from interosseous. Died May 22, 1863, pyæmia.
24	Stone, H., Pt., F, 11th Pennsylvania, age 19.	May 8, 13, '64.	One and a half, left radius; by Asst. Surg. H. Allen, U. S. A.; diarrhœa. Died June 24, 1864, pneumonia.
25	Sullivan, J., Pt., E, 49th New York.	Aug. 30, Se. 14, '62.	See CASE 1920, p. 960. *Spec.* 69.
26	Tinker, A. J., Pt., K, 10th Vermont, age 24.	April 2, 22, '65.	Three-fourths, middle, left radius; by Surg. G. L. Pancoast, U. S. V.; May 7, gangrene. Died June 31, 1865, colitis.
27	Van Nevil, W., Corp'l, E, 8th Mich., age 14.	June 18, 1864.	See CASE 1921, p. 960. *Spec.* 2985.
28	Welch, P., Serg't, K, 28th Mass., age 32.	May 12, 17, '64.	See CASE 1916, p. 959. *Spec.* 2296.
29	Wilcox, G. W., Pt., I, 57th Massachusetts.	May 19, 23, '64.	See CASE 1915, p. 959. *Specs.* 2510 and 2350.

Secondary Excisions in the Bones of the Forearm.—Forty formal excisions in the shafts of the ulna or radius were practised later than the thirtieth day after shot injury.

§ *Recoveries after Secondary Excisions.*—Two cases that are illustrated by very interesting pathological specimens will be detailed:

CASE 1922.—Private J. Campbell, Co. I, 6th Wisconsin, age 20 years, was wounded at Spottsylvania, May 10, 1864. A shot fracture of the left forearm was noted at the hospital of the 4th division, Fifth Corps, by Surgeon C. N. Chamberlain, U. S. V., and at Mount Pleasant and Chester Hospitals the progress of the case is briefly noticed until the patient's transfer to Harvey Hospital, Madison, Wisconsin, whence Surgeon H. Culbertson, U. S. V., detailed the facts of the case: "Gunshot fracture of right ulna, the ball entering at middle of lower third of forearm and emerging at the junction of the upper and middle thirds. When admitted, the lower and part of the upper fragment of the ulna was carious, and there was imperfect union and overlapping of the fragments, with a large external opening over the seat of the fracture, the result of an abscess. The constitutional state of the patient was good. On August 4th, several small pieces of bone were removed by Acting Assistant Surgeon J. J. Brown. August 9th, three inches of the ulna was removed by Surgeon H. Culbertson, U. S. V., a single incision being made over the outer border of the bone, the periosteum carefully detached, and the bone sawed off obliquely, with the chain saw, both above and below. The wound was closed with sutures. On the second day gangrene appeared, which was arrested with nitric acid locally, and tincture of muriate of iron with quinine internally. 23d, wound healing kindly by granulations."

FIG. 707.—Excised part of shaft of ulna, including a partially united shot fracture.—*Spec.* 3690.

The excised portion of the ulna (FIG. 707) was contributed to the Museum by the operator, and is interesting both as a specimen of imperfect union and as an example of a sub-periosteal excision. On January 11th, the patient was transferred to Swift Hospital, Prairie Du Chien, where he was assigned to the Veteran Reserve Corps, April 13, 1865. Two months later he was mustered out and pensioned. Examiner W. A. Anderson, of La Crosse, November 20, 1867, certified: "About four inches of the ulna is entirely gone. The ring and little fingers are permanently contracted." Examiner W. A. Gott reported, April 15, 1873: "The forearm presents a shrunken and attenuated appearance, owing in part to the loss of structure in the extensor muscles and their contraction. The power of extension is very limited and must always remain so." This pensioner was paid December 4, 1875.

The forty secondary excisions in the forearm were of the shafts of both bones in seven cases, of part of the ulna in twenty-one, of the radius in eleven, unspecified in one.[1]

CASE 1923.—Private C. W. Harch, Co. A, 105th New York, age 29 years, was wounded in the left forearm at Antietam, September 17, 1862, and admitted to Cranch Hospital, Washington, about one week afterward. Surgeon A. Wyncoop, U. S. V., noted the injury. Entering Mount Pleasant Hospital December 5th, several days afterward the wounded man was transferred to Philadelphia. Acting Assistant Surgeon L. K. Baldwin reported: "The missile was a minié ball, which entered the left arm about two inches below the olecranon process of the ulna, and was extracted about the same distance above the wrist joint, causing a compound fracture of the bone. The patient was admitted to Satterlee Hospital on December 13th. The wound at the time of his admission presented rather an unhealthy appearance, the discharge being of a thin sanious nature, giving evidence of the existence of a considerable amount of dead bone. The patient complained of a pricking sensation in and around the seat of the injury, as though there were some pieces of loose bone in the wound. After carefully examining the injury with the probe, a number of loose pieces were discovered in the region of the wound of exit, all of which were within reach and were removed by means of a pair of forceps. By this means it was hoped to get rid of the cause of the irritation and to promote the healing; but all was to no effect, the amount of injury being so extensive, and portions of dead bone so numerous, that the irritation was still kept up, rendering an operation necessary to a cure. The patient suffered so much inconvenience from the pricking sensation already alluded to that he was quite anxious to have an operation performed for the removal of the cause of the irritation. He being of a stout and robust constitution, an operation was soon decided on. He was accordingly, in order to better fit him for an operation, placed upon quinine and iron, together with a good nutritious diet, which treatment was continued until January 10th, when he was considered in a fit condition to be operated on. The mode of procedure decided upon was the excision of as much of the ulna as was found to be in any way diseased. The patient having been put under the influence of an anæsthetic (pure chloroform has been used on this occasion), an incision was made from a short distance below the olecranon process to within about an inch of the wrist joint. The bone was found to be so much shattered by the passage of the ball as to require exsection of nearly two-thirds of its whole extent, which was accordingly done. A number of pieces of bone were found lying loose in the course traversed by the ball; others were firmly united to the main shaft of the bone by granulations which had been thrown out by nature in her effort at reproduction. After the bone was removed the wound was kept open by the introduction of a piece of lint into the bottom of it, which was kept wet with cold water until the third day, when active suppuration had taken place. The wound was subsequently dressed with flaxseed poultices, and the patient's strength sustained by the administration of tonics and good nutritious diet. Active suppuration was kept up, and the wound soon began to heal kindly from the bottom. The granulations were at no time exuberant, and at the present time, January 30th, the wound is almost healed. The patient's health has not suffered any from the effects of the operation. He is beginning to have considerable motion in the arm and hand, and there is every reason to suppose that the normal use of the arm and hand will be almost wholly regained." The specimen (FIG. 708) consists of four and a half inches of the excised portion of the ulna, and shows that the bone was not broken in its entire thickness, a splinter one-fourth of an inch remaining intact. A fragment of about the same diameter and a little more than an inch in length has been fixed by new bone parallel with it. Other small fragments have been consolidated above and below it. The specimen was contributed by Acting Assistant Surgeon J. Leidy. The patient, on July 29, 1864, was discharged and pensioned. Examiner J. H. Helmer, of Lockport, January 8, 1868, certified: "The ulna was removed nearly the whole length. The thumb is flexed upon the palm, and all the fingers are flexed upon the thumb. He has no voluntary motion of the thumb or fingers." The Lockport Examining Board reported, August 4, 1875: "He is totally unable to perform manual labor. The arm is as helpless as if amputated at the shoulder joint." This pensioner was paid September 4, 1875.

FIG. 708.—Excised part of ulna showing a consolidated partial shot fracture. *Spec.* 1865.

§ *Fatal Secondary Excisions.*—The four fatal cases of the forty secondary excisions in the forearm are included in the table with the recoveries.

FIG. 709.—Excision in radius. *Spec.* 3497.

CASE 1924.—Private D. M. Harrison, Co. B, 94th Ohio, aged 33 years, was wounded at Resaca, May 14, 1864, and on May 27th was admitted to Hospital No. 1, Nashville, from a Fourteenth Corps field hospital. Surgeon R. L. Stanford, U. S. A., reported: "Gunshot wound of right forearm; a minié ball entered its inner aspect three inches below the bend of the elbow, fracturing the radius at that point, and passed into the arm without emerging." Surgeon B. B. Breed, U. S. V., reported that "large abscesses formed in the bend of the elbow and were opened. On June 17th, secondary hæmorrhage occurred from the radial artery, the patient losing about six ounces of blood." Acting Assistant Surgeon H. C. May ligated the radial artery, and excised fragments of the radius to the extent of one and a half inches, the upper extremity of that bone not being disturbed. The ball ulcerated out in the flexure of the joint soon after the 17th of June. On June 24th, another hæmorrhage occurred. Surgeon Stanford reported additionally, as follows: "June 24th, antero-posterior flap amputation at junction of lower and middle thirds of arm, by Acting Assistant Surgeon H. C. May; chloroform and ether, equal parts, were used as an anæsthetic. At time of operation the patient was very feeble, the hand and forearm inflamed, and the radial artery severed by erosion. After the operation the reparative process was feeble; treatment: stimulating dressings, tonics, and stimulants. Died of exhaustion, July 2, 1864." The specimen, represented in the adjacent wood-cut (FIG. 709), was contributed to the Museum by the operator, Dr. May. It is described by Dr. Woodhull as "the bones of the right forearm, from whose radius two inches have been removed. The upper extremity is carious."—*Cat. Surg. Sect.*, 1866, p. 184.

[1] Of the excisions of parts of both bones, 1 was fatal; 3 were on the right, 3 on the left side, and 1 unspecified. Of the 21 excisions in the ulna, 8 were on the right, 13 on the left side. Of the 11 excisions in the radius, 4 were on the right, 6 on the left, and 1 unspecified.

TABLE CXXX.

Condensed Summary of Forty Secondary Excisions of the Bones of the Forearm.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Bierbower, J., Pt., E, 45th Pa., age 23.	Sept. 14, Nov. 5, 1862.	Portions lower, right radius and ulna; by A. A. Surg. A.V. Cherbonnier. Disc'd April 10, 1863; pens'd: anch. wrist: fingers cont.
2	Boda, L., Corp'l, C, 5th Mich. Cav., age 27.	May 6, Se. 19, '64.	Four, left ulna, lower; by A. A. Surg. Merritt. Dis. Apr. 4, '65.
3	Campbell, J., Pt., I, 6th Wisconsin, age 22.	May 10, Aug. 4, '64	See CASE 1922.
4	Chase, G. W., Corp'l, C, 122d N. Y., age 17.	May 6, Nov. 28, 1864.	Middle, right radius; by A. A. Surg. C. B. King. Disch'd June 15, 1865; pensioned; rotation.
5	Dwyer, J., Corp'l, A, 9th Mass., age 29.	June 27, Aug. 23, 1862.	Five, middle, right ulna. Disc'd Nov. 24, 1862; pensioned; elbow nearly immovable.
6	*Frazier, S. W.*, Pt., F, 2d Mississippi, age 28.	July 3, Aug. 5, '63	Two, upper, radius. Furloughed; recovered.
7	Garrison, W. E., Pt., G, 3d N. J. Cav., age 20.	Oct. 19, Nov. 25, 1864.	Four, middle, right ulna; by A. Staff Surg. N. F. Graham. Discharged July 30, '65; pensioned; elbow anchy.; bone discharging.
8	Harch, C., Pt., A, 105th New York, age 28.	Se. 17, '62, Ja. 10, '63.	See CASE 1923.
9	Herron, J., Corp'l, A, 43d N. Y., age 23.	Mar. 10, M'y 15, '64	Portion left ulna. To V. R. C. Apr. 25, 1865; pens'd; unfit for labor.
10	Houts, S. D., Serg't, A, 8th Kansas, age 21.	Sept. 19, Dec. 18, 1863.	Three, upper, left ulna; by A. A. Surg. S. F. Few. Disch'd Jan. 22, 1864; no rotation; arm atrophied, weak, and deformed.
11	Hunt, N. T., Pt., D, 64th New York, age 23.	June 17, July 24, 1864.	Middle, right ulna; by A. A. Surg. J. H. Jamar. Disch'd Nov. 3, 1864; pensioned; part. anchyl. elbow; adhesions and contract's.
12	Hutchins, L., Pt., C, 19th Wisconsin, age 25.	Aug. 3, Oct. 2, 1864.	Two and a half, upper, right ulna. Disch'd April 1, '65; pensioned; arm partially paralyzed; partial flexion and extension of fingers.
13	Kelleher, P., Pt., A, 12th Massachusetts, age 20.	Sept. 14, Nov. 6, 1862.	Four, middle, left ulna; by A. A. Surg. E. G. Waters. To V. R. C. Oct. 3, '63; pens'd; no flexion or extension forearm; motion of fingers fair but power almost gone.
14	Langley, J. J., Pt., K, 15th Kan. Cav., age 34.	Nov. 19, Dec. 20, 1863.	Four, middle, left ulna; by A. A. Surg. S. F. Few. Disc'd June 3, '64; anch. elb.; general atrophy.
15	Lewis, W., Pt., A, 3d Maine, age 19.	May 19, July 11, 1864.	Rem. of spic. and excis. inch and a half left radius and ulna, middle; by A. A. Surg. G. W. Fay; false joint; hand hangs limp; useless.
16	Marr, E., Pt., B, 38th New York, age 28.	Dec. 13, 1862, Mar. 10, 1863.	Middle, left ulna (radius fract.). Dis'd Apr. 13, '63; pens'd. Apr., '72, wound open; anchyl. elb.; arm straight. Died Dec. 8, 1873.
17	Mason, D., Pt., A, 56th Massachusetts, age 37.	May 30, June 30, 1864.	One and a half, upper, left ulna and portion radius; by A. A. Surg. O. P. Sweet. Disc'd Mar. 2, '65; pens'd; hand and fingers exten'd.
18	*Medary, S.*, Pt., A, Gilmore's Battalion.	July 3, Nov. 8, 1863.	Two, left ulna, by Surg. J. H. Currey, U. S. V. To prison January 2, 1864.
19	*Moore, S.*, Pt., A, 5th North Carolina, age 21.	May 5, July 3, 1862.	Two, right radius, and several fragments (wound of groin). Exchanged October 12, 1862.
20	O'Conner, J. P., Pt., D, 33d Ohio, age 22.	July 5, 1864.	One and a half, low., left rad. Dis. Dec. 15, '64; pens'd; part. paraly. and atrophy of hand; ulna disloc.
21	O'Connell, R., Pt., A, 1st Maine Cavalry.	Aug. 20, Oct. 1, 1862.	Three, upper, left radius; by Surg. D. W. Bliss, U. S. V. Disch'd Jan. 10, 1863; pensioned; hand pronated; can feebly flex fingers.
22	Roland, W., Pt., A, 54th Pennsylvania, age 23.	July 1, 1862, Mar. 27, 1863.	Two, middle, right ulna, and small portion of radius; by A. A. Surg. C. H. Ohr. Disch'd Aug. 19, '64; pensioned; false joint; forearm and hand nearly useless.
23	Roscoe, W. H., Corp'l, B, 98th Ohio, age 23.	Sept. 20, 1863, Mar. 4, 1864.	Two, middle, right ulna (gang.). To V. R. C. Aug. 29, '64; pens'd; false anchylosis of fingers; atrophy of forearm.
24	Sandrett, W., Pt., A, 9th Pa. Reserves, age 25.	Aug. 30, Oct. 19, 1862.	Two, middle, right radius and ulna. Dis'd Nov. 20, '62; pens'd; partial anchylosis wrist and fingers; no rotation; 1867, bone exfoliating.
25	Shroeder, C., Pt., E, 22d Michigan, age 25.	Sept. 20, 1863, May 12, 1864.	Two and a half, middle, right ulna (radius fract.); by A. A. Surg. D. O. Farrand. To V. R. C. June 30, 1864. Not a pensioner.
26	Silver, W. C., Pt., F, 5th New Jersey, age 30.	May 3, July 29, 1863.	Two, lower, left radius (wound of thigh). Dis'd Jan. 4, '64; pens'd; no rotation; general atrophy.
27	Steffers, M., Pt., A, 1st Minnesota, age 25.	Sept. 1, Oct. 3, 1862.	Two, left ulna; by Surg. A. B. Hasson, U. S. A. Disch'd Feb. 17, '63; arm impaired. Not a pens'r.
28	Sturgeon, J. K., Pt., F, 46th Ohio, age 21.	Aug. 31, 1864, Feb. 3, 1865.	Six, middle, left ulna; by A. A. Surg. W. H. Drury. Disch'd May 18, '65; pens'd; anchyl. elb.; atrophy; little use of hand or arm.
29	Tower J., Corp'l, A, 19th Indiana, age 37.	July 3, Aug. 4, 1863.	Portion left ulna (gang.; necrosis). Disch'd July 29, '64; pensioned. limb impaired.
30	Traveler, H., Pt., G, 13th Pa. Cav., age 25.	Dec. 8, 1864, Jan. 13, 1865.	Six, lower, left radius; by Surg. G. L. Pancoast, U. S. V. Disch'd July 10, 1865; pensioned; hand disloc. inward; fingers contrac'd.
31	Wagoner, J., Pt., B, 11th Pa. Reserves, age 19.	June 30, Aug. 20, 1862.	Portion middle, left ulna, and fragments; radius necrosed; pyæm. threatened—amp. arm. Disch'd November 29, 1862. *Spec.* 427.
32	Wenglein, J., Pt., I, 108th N. Y., age 23.	M'y 10, '64 Second'y.	Two, middle, right radius. Deserted May 26, 1865. Not a pensioner.
33	Wettstein, P., Pt., B, 8th Kansas, age 33.	Sept. 19, 1863, Mar. 5, 1864.	Two, upper, ulna (fract. radius). To V. R. C. July 14, '64; pens'd; deformity; immobility of all fingers except index.
34	Whipple, W. H., Pt., A, 54th Massachusetts.	July 18, Dec. 28, 1863.	Half an inch from fract'd ends of left radius, middle. Disch'd Mar. 4, '64; pens'd; fingers extended backward; wrist dislocated.
35	Wilson, R. G., Pt., A, 79th N. Y., age 32.	Sept. 1, Dec. 1, 1862.	Three, left radius and ulna; by A. A. Surg. S. S. Jessop. Disc'd February 20, 1863; pensioned; no flexion or extension.
36	Yount, G., Lieut., I, 3d Missouri, age 24.	May 22, July 4, 1863.	Portion right radius (wound lung and liver). Disch'd November 16, 1864; pensioned; good motion and strength in wrist.
37	Camp, S., Pt., A, 21st Ohio, age 21.	June 9, July 14, 1864.	Three and a half, upper, left rad.; by A. A. Surg. G. E. Stubbs (erysipelas). Died August 12, 1864, gangrene.
38	Cobb, S., Pt., H, 19th Indiana.	Aug. 28, Se. 28, '62.	Excision. Died Oct. 8, 1862.
39	Hamlin, F. N., Lieut., K, 147th N. Y., age 32.	May 5, June 5, 1864.	Portion upper, left ulna; by Surg. H. W. Ducachet, U. S. V. (flesh wound arm; lig. of brach.; hæmorrhage). Died June 25, 1864.
40	Harrison, D., Pt., B, 94th Ohio, age 34.	May 14, J'e 17, '64.	See CASE 1924.

It may be observed that the secondary excisions[1] of this class, though less disastrous than those in the intermediary stage, had nearly as high a mortality as the primary excisions.

Excisions in the Forearm of Uncertain Date.—There were a hundred and thirty-two reported examples of excisions in the shafts of the bones of the forearm in which the intervals between the injury and operation were not ascertained. Unlike most series of imperfectly recorded cases, they present a small ratio of mortality—only five, or 4.3 per cent. of a hundred and sixteen determined cases having resulted in death.

[1] In the 7 excisions in both bones of the forearm, with 1 death, the extent of bone removed was from an inch and a half to 3 inches in the shafts of each bone. The 21 excisions in the ulna, with 1 death, for the most part interested the middle third, though sometimes extending to the upper and lower thirds,—the amount of the diaphysis removed varying from 2 to 6 inches. In the 11 excisions in the radius, the extent of bone exsected was from 1 to 2½ inches in 7 cases; from 3 to 6 inches in 4 cases.

TABLE CXXXI.

Summary of One Hundred and Thirty-two Cases of Excisions in the Forearm, the Time between the Injury and Operation being unknown.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Allen, A. J., Pt., I, 116th Pennsylvania, age 18.	June 3, 1864.	Three, lower, right ulna. Disch'd Dec. 26,'64; pens'd; no extension and imperfect flexion of fingers.
2	*Allen, J. G.*, Corp'l, H, 24th N. C., age 23.	April 2, 1865.	Portion right radius. To prison June 11, 1865.
3	Atkins, A., Corp'l, C, 5th New York.	June 27, 1862.	Two, lower, radius. Disch'd Oct. 19, '62; pens'd; wrist and hand greatly distorted and impaired.
4	*Barker, J. T.*, Lieut., 21st Georgia, age 25.	Oct. 19, 1864.	Portion middle, left radius (w'd of thigh). To prison Feb. 16, '65.
5	Bates, T. K., Capt., B, 18th Connecticut, age 28.	June 15, 1863.	Two and a half, upper, left ulna (fract. radius). Disch'd Nov. 17, 1863; pens'd; no rotation; partial extension; much deformity.
6	*Berry, B.*, Pt., B, 5th Louisiana, age 34.	Mar. 26, 1863.	Excision of portion of radius. April 30, 1863, doing well.
7	Birdsall, D. E., Lieut., E, 5th Michigan, age 22.	Oct. 27, 1864.	Two and a half, middle, right radius. Disch'd Jan. 12,'65; pens'd; hand bent and weak.
8	*Blanchard, J. H.*, Pt., F, 16th Georgia.	———	Two inches of ulna. October 17, ——, discharged nearly cured.
9	Boedecker, H. A., Pt., A, 31st Missouri, age 28.	Sept. 20, 1863.	Three and a half, right radius, lower. To V. R. C. May 9, 1864; pen'd; wrist j't dist'd; ulna dist.
10	Bowers, J. F., Lieut., B, 23d Ohio, age 22.	Sept. 22, 1864.	Three, upper, right ulna. Duty Nov. 4, 1864; pensioned; use of arm impaired.
11	Brinley, G. W., Pt., E, 81st Indiana, age 23.	Dec. 16, 1864.	Portion lower, right ulna. Duty May 4, 1865. Not a pensioner; no disability.
12	*Brooks, J. F.*, Pt., C, 9th Alabama, age 20.	——— July 30, 1864.	Portion middle, right radius. Furloughed September 10, 1864; muscles contracted.
13	Brown, W., Pt., F, 105th Illinois, age 24.	May 15, 1864.	Lower, left ulna. Disch'd Sept. 13, '64; pens'd; joint distorted; unable to work hard.
14	Burgess, G., Pt., A, 10th Wisconsin, age 23.	Sept. 20, 1863.	Two, upper, ulna. Disch'd Nov. 3, 1864; pensioned; use of limb much impaired.
15	*Burke, W. J.*, Corp'l, I, 21st Georgia, age 25.	July 12, 1864.	Portion of middle third, right radius. To prison Aug. 15, 1864.
16	*Burt, J. A.*, Serg't, K, 12th North Carolina, age 25.	May 12, 1864.	Two-thirds right ulna. Retired Mar. 3, 1865; arm semiflexed; atrophy; anchyl. and weakness.
17	Byers, R. H., Pt., H, 107th Pa., age 22.	Sept. 17, 1862.	Portion middle, left ulna. Disch'd Feb. 18,'63; pens'd; limb weak
18	Carrigan, R., Pt., C, 59th Illinois, age 20.	May 26, 1864.	Three inches, lower third, right ulna. Disch'd Jan. 5, 1865.
19	Carson, C. W., Pt., A, 26th Ohio, age 27.	Sept. 19, 1863.	Three and a half, lower, right radius. Disch'd June 10,'64; pen'd; hand and arm almost useless.
20	*Connelly, J.*, Pt., B, 14th Louisiana, age 29.	———	Three, lower, right radius. Ret'd Mar. 6,'65; anchylosis of wrist.
21	*Cook, J. F.*, Pt., F, 19th Mississippi, age 34.	Aug. 21, 1864.	Two inches, upper third, left ulna. Retired March 9, 1865.
22	Court, J., Pt., F, 101st Pennsylvania, age 26.	May 31, 1862.	Four, lower, left radius. Disch'd Aug. 29, 1862; pensioned; limb greatly impaired.
23	Craig, W., Pt., D, 5th Artillery, age 35.	Sept. 17, 1863.	Three, lower, right ulna. Disch'd Oct. 25, '65; pens'd; anchylosis of wrist; hand entirely useless; health poor.
24	Cruger, H. C., Pt., K, 34th Indiana, age 21.	July 21, 1863.	Portion lower, left radius. Disch'd Nov. 7, 1864; pensioned; use of limb impaired.
25	Davis, D. T., Pt., H, 64th Illinois, age 29.	July 22, 1864.	Two, upper, left ulna. Disch'd Aug. 1, 1865; pensioned; fingers flexed on palm.
26	Delallyde, M., Pt., I, 69th New York.	———	Large portion left ulna. Disch'd Jan. 29, 1863. Not a pensioner.
27	Dennis, M., Pt., C, 2d Cavalry, age 26.	Aug. 4, 1861.	Portion upper, left radius. Discharged April 3, 1862; pensioned; useless for manual labor.
28	Dingman, J. M., Pt., A, 64th Illinois, age 21.	Aug. 4, 1864.	Two, left ulna. Disc'd Jan. 18,'65; pens'd; atrophy; anchy. and dis. of elbow; arm and hand useless.
29	Doran, J. E., Capt., K, 149th N. Y., age 33.	July —, 1863.	Portion right radius. Discharged Feb. 5, 1864. Not a pensioner.
30	Downs, D. L., Pt., H, 22d Kentucky.	Dec. 29, 1862.	Two, middle, right ulna. Disc'd April 8, 1863; arm atrophied, weak; stiffness of elbow.
31	Dyer, I. J., Corp'l, E, 99th Illinois, age 24.	May 20, 1863.	Three, middle, left radius (fract. ulna); July 25, gang.; erysipelas. Disch'd Oct. 8, '63; pensioned; artificial joint; useless append'c.
32	*Eady, W.*, Pt., F, 5th North Carolina.	July —, 1863.	Three, left radius. Transferred Sept. 5, 1863, for exchange.
33	*Ferrell, G. A.*, Pt., Pamunky Art., age 19.	June 17, 1864.	Three, middle, left radius. Retired; use of limb impaired.
34	Fernill, T., Pt., C, 14th Connecticut, age 21.	Dec. 13, 1862.	Four and a half, middle, left ulna. To V. R. C. Aug. 13, '64; hand useless.
35	Foy, M., Pt., C, 88th New York, age 28.	Sept. 17, 1862.	Portion ulna. To V. R. C. Dec. 12, 1863; motion of hand impaired; rotation nearly perfect. Insane.
36	*Gainey, J. A.*, Lieut., F, 24th North Carolina.	Sept. 7, 1864.	Portion lower, left ulna. Furloughed Oct. 10, 1864.
37	Garvey, J., Pt., D, 97th Pennsylvania, age 45.	Oct. 27, 1864.	Two, left ulna; no bony union; rotation lost. Disch'd June 8, 1865. Not a pensioner.
38	*Gibson, J. H.*, Pt., H, 23d South Carolina.	Oct. 31, 1864.	Portion lower, left ulna. Furl'd December 2, 1864.
39	*Goggin, E. J.*, Capt., M, 7th South Carolina.	May 6, 1864.	Right forearm. Furloughed.
40	Graham, J. M., Pt., A, 95th Illinois, age 25.	May 22, 1863.	Two and a half, middle, left ulna. To V. R. C. Nov. 25,'63; pens'd; limb impaired and painful.
41	Graham, T. M., Pt., I, 11th Pa. Res., age 23.	May 5, 1864.	Three, right radius. Duty July 26, '64. Not a pensioner. *Spec.* 2300.
42	*Grelly, J. S.*, Corp'l, D, 11th Miss., age 25.	Oct. 27, 1864.	Three, upper, left ulna. Retired Feb. 9, 1865.
43	Hanely, T., Pt., K, 123d N. Y., age 24.	July 20, 1864.	Four, middle, left ulna. To V. R. C. Dec. 15,'64; arm deformed; hand weak and almost useless.
44	Hart, M., Pt., D, 3d Maryland, age 30.	July 3, 1863.	Three, lower, left ulna; hæm. To V. R. C. Dec. 31, 1863; false joint.
45	Hawkins, C., Pt., D, 4th Ky. M. Inf., age 27.	Nov. 12, 1864.	Four, lower, ulna. Disch'd Aug. 13, 1865; pensioned; wrist and fingers flexed and partially anchylosed; useless.
46	*Heyler, J. M.*, Pt., I, 48th North Carolina.	June 15, 1864.	Portion middle, left radius and ulna. Retired Mar. 14, 1865.
47	Hillman, T. A., Pt., F, 1st N. Y., age 18.	June 1, 1862.	One and a half, lower left radius. Disch'd Oct. 26,'62; pens'd; part. anchyl. wrist; atrophy forearm and hand.
48	Hook, S. E., Pt., A, 1st Mass. Bat., age 23.	June 2, 1864.	Portion upper, left radius. Duty Sept. 3, 1864; pens'd; Nov.,'64, limb much impaired.
49	Hughes, J. M., Pt., H, 117th Ohio.	———	Entire middle third, left radius. To V. R. C. Nov. 17, '63; pens'd; weak.
50	*Irwin, S. L.*, Pt., Virginia Artillery.	———	One and a half, upper, left ulna. Retired March 18, 1865.
51	Jones, G. W., Pt., F, 3d Del., age 25.	June 18, 1864.	Portion right ulna. Disch'd June 15, '65; pens'd; rotation lost; greatly impaired.
52	Karch, P., Pt., I, 150th Penn., age 20.	July 1, 1863.	Portion upper, right ulna. Disch'd Nov. 24, 1864.
53	Kauffman, J., Pt., C, 155th Penn., age 37.	Mar. 31, 1865.	Two, upper, left ulna; gang. and erysip. Disch'd July 27, '65; pens'd; forearm entirely useless.
54	*Keck, J. M.*, Pt., F, 6th N. C., age 20.	Jan. 7, 1864.	Portions right ulna. Retired December 30, 1864.
55	Keever, J. G., Pt., E, 4th N. Y. H. A., age 25.	Aug. 25, 1864.	Three, middle, left ulna. To V. R. C. Mar. 29, '65; use of limb impaired; pens'd; extension only to 135°.
56	Kehoe, O. P., Pt., I, 7th Penn. Cav., age 33.	Aug. 21, 1864.	Four, middle, right rad. Disch'd May 24,'65; use of arm impaired.
57	Kelly, W. S., Pt., C, 88th Indiana, age 28.	May 18, 1864.	Portion lower, right rad. (wound of thigh). Disch'd Feb. 8, 1865; partial paralysis of hand.
58	*Kendall, M. R.*, Pt., H, 43d N. C., age 37.	May 16, 1864.	Portion left ulna. Retired Feb. 18, '65; contraction of extensors.
59	Ketchum, B., Pt., I, 5th New York.	June 10, 1861.	Four, left radius. Disch'd Dec. 31, 1861.
60	*Kidwell, O. D.*, Pt., H, 4th Alabama.	——— J'e 22,'64.	One, upper, right ulna. Furloughed August 19, 1864.
61	Lahe, P., Pt., D, 3d V. R. C.	June 30, 1864.	Middle, left ulna. Disch'd July 12, 1865; arm nearly useless.
62	Leech, W. S., Lieut., A, 139th Pa., age 27.	Oct. 19, 1864.	Four and a half, middle, left ulna. Disch'd Jan. 16, 1865; pensioned; grasp nearly destroyed.
63	Lehman, J., Pt., G, 8th Missouri.	Jan. 11, 1863.	Three, right radius. Discharged August 8, 1863; pensioned; great deformity; limb useless.
64	Lehr, C. S., Pt., F, 27th Illinois, age 22.	May 9, 1864.	Two and a half, middle, left radius and ulna. Disch'd Sept. 20, '64; pensioned; no union; arm useless.
65	*Lightfoot, J. M.*, Col., 6th Alabama.	May 7, 1864.	Portion left ulna. Furloughed May 23, 1864.
66	Luchsenger, H., Pt., K, 72d Pennsylvania.	June 29, 1862.	Portion upper, right radius. Discharged Nov. 5, '62; pensioned; useless for manual labor.
67	*Lyon, J. E.*.....	April 18, 1864.	Four, right ulna. Retired January 27, 1865.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
68	Marley, H. P., Pt., K, 191st Pennsylvania Reserves.	May 10, 1864.	Portion right radius (fract. ulna). Discharged March 25, 1865; pensioned; hand useless.
69	Martin, G. W., Serg't, C, 75th Ohio.	———	Portion left ulna. To V. R. C. January 4, '64. Not a pensioner.
70	*Maxwell, R. H.*, Lieut, C, 1st N. C.	Sept. 13, 1863.	Three, right radius. Furloughed October 26, 1863.
71	McCormick, T., Pt., A, 5th Kentucky.	June 24, 1863.	Three, lower, left radius. Mustered out Sept. 14, 1864; pensioned; no union; motions of hand and wrist impaired.
72	*McEntyre, J. C.*, Pt., H, 15th Alabama, age 28.	Aug. 17, 1864.	Portion middle, ulna; gangrene. August 31, doing well. Furloughed September 30, 1864.
73	McGaw, S. P., Pt., K, 84th Illinois, age 35.	Sept. 20, 1863.	Three, middle, left radius. Disch'd Feb. 25, 1864; partial anchylsis elbow; rotation lost; cannot flex hand; pensioned.
74	McKenzie, L., Pt., D, 126th Ohio, age 32.	May 5, 1864.	Two and a half, lower, left ulna. To V. R. C. January 26, 1865. Not a pensioner.
75	*McKissack, A. H.*, Pt., A, 15th Ala., age 22.	——— Au. 16,'64	Two, left radius. Aug. 31, wound doing well. Furlo'd Sept. 8,'64.
76	*McMurry, F. H.*, Pt., F, 12th Miss., age 27.	——— J'e 19,'64.	Portion middle, ulna. June 30, doing well. Furlo'd July 16,'64.
77	Moore, T. J., Lieut., A, 101st Ill., age 27.	June 27, 1864.	Two, lower, left ulna. Duty Aug. 15,'64; pensioned; use impaired.
78	Morgan, W., Pt., H, 29th Pennsylvania, age 34.	June 15, 1864.	Three, middle, right ulna. Disch'd Sept. 7, '65; pensioned; sensation and motion impaired in fingers.
79	Munger, H. W., Pt., I, 85th N. Y., age 24.	April 20, 1864.	Portion lower, left ulna. Duty Mar. 6, '65; pens'd; atrophy; fingers flexed and nearly anchyl'd.
80	*Naugle, I. O.*, Pt., A, 17th Miss., age 19.	Nov. 29, 1863.	Portion middle, radius. January 1, 1864, doing well.
81	Oberfell, J., Pt., B, 9th Illinois, age 36.	Feb. 15, 1862.	Two, middle, right radius. Discharged Sept. 5, 1864; adhesions of muscles; ulna partly dislocated.
82	Oliver, N. C., Pt., H, 18th Mississippi, age 20.	——— J'e 4,'64.	Middle, right radius. Furloughed September 12, 1864.
83	*Parker, W.*, Pt., B, 16th Virginia.	———	Portion right ulna, middle. Retired December 29, 1864.
84	*Pennybaker, S. W.*, Pt., F, 2d Miss., age 21.	———	Three inches, middle third, left radius. Recovered.
85	Perkins, H., Corp'l, I, 10th Illinois, age 40.	May 21, 1865.	Middle, left radius; atrophy of forearm and hand; stiffness of wrist and finger joints. Disch'd July 3, 1865; pensioned.
86	Pfierman, D., Pt., G, 1st Louisiana, age 32.	June 26, 1863.	Portion of right radius. Disch'd Aug. 18, '64; pensioned; use of limb impaired, and deformed. Died in 1868, yellow fever.
87	Rectamus, H., Corp'l, B, 149th Pa., age 22.	May 8, 1864.	Three and a half, upper, left ulna. Disch'd Mar. 20, '65; pensioned; power of wrist much impaired.
88	Ryan, J., Pt., M, 10th N. Y. Cav., age 19.	July 3, 1863.	Portion of left ulna. Disch'd Aug. 26, 1864. Not a pensioner. *Spec.* 4379.
89	Sailisbury, W. N., Serg't, F, 42d Illinois, age 20.	June 27, 1864.	Two and a half, lower, left radius. Disch'd Feb. 15, '65; pensioned; incomplete paralysis of hand; ulna dislocated.
90	Samon, J., Pt., I, 96th Pennsylvania, age 21.	May 13, 1864.	Two, lower, left ulna. Duty Sept. 15,'64; pens'd; grasp weakened; fair use of hand; styloid process prominent.
91	Schlotzer, L., Serg't, A, 187th New York, age 26.	Oct. 27, 1864.	Two, upper, right radius. Disch'd April 1, 1865; pensioned; loss of rotation.
92	Seibold, F., Corp'l, B, 26th Wisconsin, age 21.	May 15, 1864.	Three, middle, left ulna. To V. R. C. Dec. 20, 1864; pens'd; no union; arm and hand useless.
93	Sheriden, W. C., Capt., C, 6th Ohio, age 27.	May 14, 1864.	One, middle, right radius and ulna. Disch'd June 23,'64; pen'd; hand pronated; wrist and fing. strong.
94	*Smith, D. S.*, Pt., I, 47th Alabama, age 48.	May, 1864.	Two, lower, left ulna. Ret'd Mar. 22, '65; hand almost useless.
95	*Smith, T.*, Lieut., 22d Virginia Battery.	Aug. 19, 1864.	Four, left ulna. Retired Feb. 15, 1865; anchylosis of elbow.
96	Smith, W. M., Corp'l, G, 63d Pennsylvania, age 29.	June 1, 1862.	Portion lower, right ulna. Disch'd Sept. 17, '62; pensioned; necrosis; cartilaginous union.
97	*Smith, W. D.*, Corp'l, F, 12th Miss., age 22.	May 12, 1864.	Three inches, right radius. Retired Feb. 20, 1865.
98	Stephens, E. J., Pt., E, 4th Wisconsin, age 22.	Oct. 21, 1861.	Portion lower, ulna. Discharged April 3, 1862; pensioned; rotation lost; hand useless.
99	Strobel, D., Pt., D, 10th New York Heavy Artillery, age 20.	Mar. 31, 1865.	Two, middle, right ulna. Disch'd June 9, 1865; pens'd; atrophy forearm and hand; wrist anchyl.
100	Swain, H. G., Pt., G, 1st Massachusetts.	July 2, 1863.	Two, lower, right radius. Disch'd Jan. 7, '64; limb useless; pens'd. Died Dec. 10, '71, consumption.
101	Telle, S. H., Pt., I, 143d Pennsylvania, age 43.	July 1, 1863.	Two and a half, left ulna. Disch'd Jan. 6, '64; pensioned; anchylosis of elbow. Died Mar. 8, 1869.
102	Thomas, H. O., Corp'l, D, 18th Massachusetts, age 21.	Dec. 13, 1862.	Five, right radius. Disch'd Mar. 28,'63; pens'd; rotation lost; wrist disloc.; ulna rides over carpals.
103	*Till, E. R.*, Ensign, 9th Alabama, age 28.	1864. Oct. 28.	Two and a half, upper, left ulna. Duty January 23, 1865.
104	True, H. W., Pt., I, 25th Ohio, age 22.	July 1, 1863.	Portion lower, right ulna. Disch'd July 2, 1864; pensioned; anchylosis wrist and fingers; atrophy.
105	Turner, J. B., Capt., & A. A. G. Gen. Meagher's Staff.	———	Portion of radius. Furloughed May 11, 1863; killed May 5, '64, at the Wilderness.
106	*Tuttle, R. M.*, Capt., F, 26th North Carolina.	Sept. 30, 1864.	Four, left radius. Retired March 14, 1865.
107	Vancice, J., Pt., C, 83d Penn., age 24.	Sept. 30, 1864.	Three, lower, left radius (wound of chest). Disch'd Apr. 14, '65; pen'd; great deformity of wrist joint; hand curved forward.
108	*Vidal, A. J.*, Pt., Marion Artillery.	July 7, 1864.	Entire shaft of right ulna. Retired Jan. 10, 1865.
109	*Ward, D.*, Pt., G, 25th Va. Bat., age 25.	Sept. 23, 1864.	Portion, right radius. Retired March 4, 1865.
110	*White, C. A.*, Pt., H, 59th Virginia, age 52.	June 28, 1864.	Three, lower, right radius. Retired June 27, 1865.
111	*Wilkinson, E. W.*, Pt., I, 15th Ga., age 31.	———	Portion left ulna. Released July 17, 1865.
112	Barker, A. J., Pt., D, 109th N. Y., age 27.	———	Left. Died June 8, 1864, of pyæmia.
113	Bowers, T., Pt., A, 47th Pennsylvania.	Oct. 19, 1864.	Middle, radius; erysipelas. Died Jan. 23, '65, thrombus of pulmonary artery.
114	*Jolly, W. N.*, Pt., H, Palmetto Sharpsh'rs.	———	Portion of right ulna. Died Oct. 20, 1864.
115	Nichols, B., Pt., D, 14th Conn., age 41.	———	Right forearm. Died June 20, '64.
116	Spiddle, W., Corp'l, D, 55th Penn. age 24.	June 18, 1864.	Portion of left ulna. Died July 11, 1864, typhoid fever.
117	*Addison, W.*, Pt., B, Palmetto Sharpshooters.	Oct. 7, 1864.	Portion of radius.
118	*Gallman, R. N.*, Pt., H, 5th South Carolina.	Sept. 30, 1864.	Portion of ulna.
119	*Haxley, G. W.*, Pt., A, 26th Virginia.	——— July 24.	Two inches, upper third, left ulna (radius fractured).
120	*Hayslip, B. G.*, Serg't, B, 11th Georgia.	July 30, 1864.	Left ulna.
121	*Johnson, W. H.*, Pt., H, 6th Georgia.	Aug. 18, 1864.	Ulna.
122	*Justice, T. M.*, Pt., C, 6th South Carolina.	Oct. 7, 1864.	Right radius.
123	*Knight, M.*, 14th South Carolina.	Aug. 16, 1864.	Portion of left radius.
124	*Moore, J. E.*, Pt., C, 2d South Carolina.	Sept. 30, 1864.	Portion of left ulna.
125	*Nelson, G. J.*, Pt., E, 50th Virginia, age 22.	———	Four inches, lower third, ulna.
126	*O'Briant, J. C.*, Lieut., B, 2d South Carolina.	Sept. 30, 1864.	Portion of right ulna.
127	*Owen, J.*, Pt., L, Palmetto Sharpshooters.	Oct. 7, 1864.	Portion of right ulna.
128	*Parker, J. J. G.*, Pt., L, 7th S. C. Battery.	———	Radius.
129	*Perry, S. W.*, Pt., I, Palmetto Sharpshooters.	Oct. 7, 1864.	Portion of left ulna.
130	*Simmons, J. A.*, Corp'l, B, Palmetto S. S.	Oct. 7, 1864.	Left forearm.
131	*Spencer, W. B.*, Serg't, B, 38th Virginia	———	Lower third, radius.
132	*Weesner, B. F.*, Pt., C, Phillip's Ga. Legion.	———	Portion of right radius.

The extent of excisions in the shafts in the hundred and thirty-two operations above enumerated is specified in the foot-note.[1] In three cases, both bones were interested; in seventy-two, the ulna; in fifty-three, the radius; in four, the part excised was unspecified.

[1] In the 3 excisions of both bones, the amounts of the shafts removed varied from an inch to 2½ inches. In the 72 excisions of the ulna, the extent of bone excised was unspecified in 28 cases; in 15 cases from 1 to 2 inches were removed; in 20 cases from 2½ to 3½ inches; in 9 cases 4 inches or more were excised, the bone being extirpated in one of these instances. In the 53 excisions in the radius of uncertain date, the extent of bone removed was not recorded in 22 cases; in 6 cases from 1½ to 2 inches were excised; in 19 from 2½ to 3 inches; in 6 from 3½ to 5 inches.

The operations were on the right extremity in fifty-two cases, on the left in sixty-seven, not reported in thirteen. Of the five fatal cases, two were excisions on the right and two on the left side, and one unspecified. Seventy-six of the patients were Union, and fifty-six Confederate soldiers.

Concluding Observations on Excisions in the Shafts of the Bones of the Forearm.—Of this large number of excisions in the continuity of the forearm there is little to remark, save that, in the aggregate, the mortality of shot fractures of the bones of the forearm appears to have been sensibly augmented by operative interference,[1] and that I have sought in vain for a single instance in which a formal excision of a portion of the shaft of either radius or ulna had a really satisfactory result, as regards the functional utility of the limb. The representations of Baudens of his Algerian experience, led the German surgeons to practise these excisions in the shafts of the long bones to some extent, in the Danish and Austrian campaigns, with very unsatisfactory results. Similar operations were resorted to with comparative frequency during the American War, and the results plainly indicate, I think, that formal primary operations of this nature should be banished from the practice of military surgery. It is bad enough to remove adherent primary sequestra, for our Museum abounds in examples where such fragments have retained their vitality and maintained the continuity of long bones. It is worse to deliberately remove unoffending healthy portions of the bone. The mortality, greatly exceeding that of the expectant conservative treatment, the numerous consecutive amputations, and the large proportion of hopelessly deformed limbs, sufficiently condemn such operations. I have found nothing in the reports of the surgery of the late Franco-German War that was not conformable to these conclusions.[2]

The influence of age on the results of these excisions was not marked.[3] There was but slight difference in the mortality in the operations practised in the Eastern and Western armies.[4]

Those who carefully scrutinize the foregoing tables will observe a seeming discrepancy between them and the numerical statement on page 922. But the figures are correct in both instances.[5] In the table of *fractures* there are given, among the twelve hundred and ninety-one fractures of both radius and ulna, eighty-seven treated by excision; but in this group *both* bones were excised in fifty-nine instances only, and the remaining twenty-eight

[1] The mortality in 2,943 determined cases of shot fractures in the forearm treated by expectation was 6.4;—of 965 determined cases treated by excision, the death-rate was 11.2;—of 1,256 cases of shot fracture of the forearm in which amputation in the forearm, elbow, or arm were primarily or consecutively performed, 205 or 16.3 per cent. died.

[2] Beck (B.) (*Chir. der Schussverletz.*, 1872, S. 665), treating of shot wounds of the forearm in the Franco-German War, observes: "Regarding resection in the continuity, I cannot approve of the operation for reasons already adduced. Aside from the fact that by such interference osteomyelitis and pyæmia may readily be caused, serious disorders, such as injuries of the blood-vessels and subsequent hæmorrhages, may be induced. In a case at Strasbourg, for instance, the artery was injured during the resection of the ulna, although the case ended well, the bleeding having been definitively controlled by ligation. The two resections performed by us in the radius and in the ulna were more properly extraction and pinching off of splinters and partial sawing off of prominent points of sharp bone, a proceeding which under some circumstances may be approved, as thereby, without injury to the wound, serious complications may be averted."

[3] Of 985 patients (two of the 986 operations were practised on 1 patient) 104, of whom 10 died, were under twenty years; between 20 and 24 years inclusive, there were 300 cases, with 31 deaths and 2 undetermined results; between 25 and 29 years, 212 cases, with 10 deaths and 2 undetermined results; between 30 and 34, there were 110 cases with 11 deaths; between 35 and 39 years, 45 cases with 6 deaths; 40 and over, 53 cases with 4 deaths; of age not ascertained, 161 cases with 37 deaths.

[4] Of 953 determined cases, 678 were of excisions on soldiers serving on the hither side of the Alleghanies, with 79 deaths, or 11.8 per cent.; 275 cases, with 30 deaths or 12.2 per cent., were on soldiers serving in the West.

[5] Of the 986 operations, the result was known in 965. These included 109 deaths, or 11.2 per cent. Of excisions of both bones there were 59 with 7 deaths, or 11.8 per cent., with 28 recoveries and 1 death in the operations on the right side, 28 recoveries and 5 deaths on the left side. 3 unspecified cases with 1 death. Of 496 excisions in the ulna, 483 with 48 deaths, or 9.9 per cent., were determined, of which 216 with 21 deaths were on the right side, 256 with 27 deaths on the left; 11 unspecified cases ended in recovery. Of 413 excisions in the radius, 406 were determined, with 48 deaths, or 11.8 per cent.; 183 with 25 deaths were on the right, 207 with 21 deaths on the left side; to which must be added 16 unspecified cases with 2 deaths. In 18 instances in which the bone implicated was unknown, the results of 17 with 6 deaths, or 35.2 per cent., were determined; 5 with 1 death were on the right side, and 4 with 2 deaths were unspecified.

cases go to augment the number of excisions in the ulna alone or in the radius, and so of the other categories, the numbers really conforming to those in the tables of *operations*.

AMPUTATIONS IN THE CONTINUITY OF FOREARM FOR SHOT INJURY.—Obviously those surgical canons—that amputation is seldom necessary after wounds in the forearm by musket balls, and that this operation can only be legitimately performed as a primary one when both bones are fractured and the radial and ulnar arteries are wounded (Tripler,[1] Guthrie[2])—were not very generally regarded by our surgeons, since there were no less than seventeen hundred and forty-seven amputations in the forearm, of which over a thousand were primary operations. The cases were distributed as set forth in the following table, the figures representing the number of operations and not the number of patients; for in eight instances, at least, both forearms were removed in the same individual. Six hundred and eleven of the operations were done because of shot wounds of the wrist.

TABLE CXXXII.

Numerical Statement of Seventeen Hundred and Forty-seven Cases of Amputations in the Forearm for Shot Injury.

OPERATIONS.	CASES.				RATIO OF MORTALITY.	UPPER THIRD.			MIDDLE THIRD.			LOWER THIRD.			POINT OF ABLATION NOT SPECIFIED.		
	Recovered.	Died.	Undeterm'd.	Total.		Recovered.	Died.	Undeterm'd.	Recovered.	Died.	Undeterm'd.	Recovered.	Died.	Undeterm'd.	Recovered.	Died.	Undeterm'd.
Primary	910	97	.....	1,007	9.6	270	26	.....	356	25	.....	266	28	.....	18	18	.....
Intermediary	344	106	.....	450	23.5	97	31	.....	164	41	.....	79	21	.....	4	13	.....
Secondary	155	29	.....	184	15.7	46	9	.....	72	8	.....	34	6	.....	3	6	.....
Time of operation unknown	83	10	13	106	10.7	10	.....	2	8	1	1	16	1	1	49	8	9
Total	1,492	242	13	1,747	13.9	423	66	2	600	75	1	395	56	1	74	45	9
Aggregate percentages (1734 det'd cases, 13.9% fatal).						491 (13.4% fatal).			676 (11.1% fatal).			452 (12.4% fatal).			128 (37.8% fatal).		

The operations will be analysed in seven tabular statements, the successful and fatal primary, intermediary, and secondary cases, each occupying two tables, and those of uncertain date one. The operations in the different regions of the forearm are distinguished in each table by the alphabetical arrangement.

Primary Amputations in the Forearm for Shot Injury.—A thousand and seven such operations, with a mortality of 9.6 per cent., are to be enumerated. A hundred and forty-three were practised on account of disorganization of the extremity by cannon balls or shell or torpedo fragments,—fifty-six in artillery men serving the rammer and injured by premature explosion of the gun.

§ *Recoveries after Primary Amputations in the Forearm.*—There were nine hundred and ten of these operations on nine hundred and three patients, there having been seven

[1] TRIPLER (C. S.), *Hand-book for the Military Surgeon: Being a Compendium of War Surgery*, Cincinnati, 1861, p. 60. "Amputation of the forearm is rarely required; as the fragments may be easily removed and the arteries tied."

[2] GUTHRIE (G. J.) (*A Treatise on Gunshot Wounds*, 3d ed., 1827, p. 535) says: "Wounds of this part are frequently more serious in their results than their appearance at first gives reason to suspect; and the operation of amputation becomes in general a secondary, rather than a primary one, from the subsequent evils demanding it; and the principal one arises from the constitution becoming affected, so as in time to endanger life. For, although the forearm is liable to more complicated injuries than the upper arm, still it is quite under our management. The two bones can be more easily got at, and pieces extracted with ease; the arteries, particularly the radial and ulnar, can be cut down upon, and, except at the upper part, secured without any difficulty. The interosseal, ulnar, and radial arteries can and ought to be fairly tied whenever they bleed, at any sacrifice of muscular parts; and the fascia may be divided freely in every direction, as it may be found to impede the discharge of matter or cause other inconvenience to the patient. An advantage arises also from the number of the arteries supplying the lower part of the limb, for if one be wounded, another, and perhaps two, remain to support and nourish the parts below, which, from the free communication of the palmar arches, is readily effected; mortification of the fingers, therefore, seldom or never takes place from wounds of the forearm."

instances of double amputations in the forearm. In three of these the two limbs were divided in different thirds of the forearm. In four the ablations were made at corresponding points. The following case is an interesting illustration of one of the latter sub-group:

CASE 1925.—Private S. H. Decker, Co. I, 4th Artillery, aged 24 years, was wounded in both forearms, at Perryville, October 8, 1862. Surgeon J. P. Walker, 85th Illinois, recorded his admission to Hospital No. 9, October 15th, with "Amputation of both forearms." On November 3, 1862, the man was discharged from service and pensioned. He visited the Army Medical Museum in November, 1867, when the following facts in relation to his wounds were obtained from his own statement: "While ramming his piece during the battle, he had half of his right forearm, and somewhat less of the left, blown off by the premature explosion of the gun. At the same time his face and chest were badly burned. Five hours after the accident both forearms were amputated by the circular method, about the middle, by an assistant surgeon of the regular army, whose name he could not recall. He laid in the field hospital at Perryville until the wounds were partially cicatrized, when, on November 1st, he went to Louisville, where he was discharged the service. About the middle of January, 1863, the stumps were completely healed." In the autumn of 1864, Mr. Decker began to make experiments for providing himself with artificial limbs, and during the following March he produced an apparatus hitherto unrivaled for its ingenuity and utility. The photograph represented in the annexed cut (FIG. 710), was obtained on the occasion of the pensioner's visit to the Museum, and shows the appliance (FIG. 711) when in use. With the aid of this ingenious apparatus, he is enabled to write legibly, to pick up any small object, a pin for example, to carry packages of ordinary weight, and to feed and clothe himself. This pensioner has been for some years employed as a doorkeeper at the House of Representatives, and was still on duty there in March, 1876.

FIG. 710.—Amputation of both forearms. [From a photograph.]

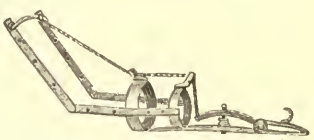

FIG. 711.—Prothetic apparatus for forearm stumps. *Spec.* 4783, A. M. M.

TABLE CXXXIII.

Summary of Nine Hundred and Ten Cases of Recovery after Primary Amputations in the Forearm for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Ackerman, T. J., Corp'l, E, 6th N. Y., age 26.	Oct. 19, 19, '64.	Right; circular. Disch'd May 31, 1865; pensioned; good stump.	21	Bowen, T. S., Pt., F, 36th Ill., age 21.	Nov. 25, 27, '63.	Right; circ.; by Dr. J. G. Buchanan. Pens'd June 16, 1864.
2	Adams, R., Pt., I, 8th Pennsylvania Res.	Dec. 13, 13, '62.	Right; flap; by Surg. T. Jones, 8th Pa. Res. Dis. June 2, '63; pens'd.	22	Bradford, W. C., Pt., K, 66th Indiana, age 46.	Aug. 12, 12, '64.	Left; by Surg. J. Pegue, 66th Ill. Disch'd Jan. 30, '65; pens'd.
3	Alcoke, R. S., Lieut., K, 57th New York.	Dec. 13, 13, '62.	Left; by Surg. C. S. Wood, 66th N.Y. Dis'd; pens'd; good stump.	23	Brady, E., Corp'l, D, 1st Bat'n, 17th U.S. Inf.	Sept. 17, 17, '62.	Right; circ.; by A. Surg. W. R. Ramsey. Pens'd Dec. 13, 1862.
4	Applebee, G. B., Pt., B, 6th Maine Battery.	June 5, 5, '64.	Right. Discharged Nov. 4, 1864; pensioned.	24	Brittain, J. H., Pt., A, 91st Penn., age 16.	June 18, 18, '64.	Left; flap; by Surg. J. Kerr, 62d Penn. Disch'd Apr. 8, '65; pen'd.
5	Atwood, W. N., Pt., K, 12th Mass., age 42.	Dec. 13, 13, '62.	Left; flap; by A. Surg. S. C. Whittier, 11th Mass. Dis. Feb. 11, '63.	25	Brown, A. C., Pt., A, 33d Indiana, age 23.	May 25, 26, '64.	Right; circ. Discharged; pensioned.
6	Avy, W. H., Pt., H, 54th Pa., age 29.	April 2, 2, '65.	Left; flap. Discharged June 26, 1865; pensioned.	26	Brown, B. M., Pt., I, 4th N. Y. H. A., age 20.	April 6, 8, '65.	Left; flap; by Surg. Geo. R. Sullivan. Disch'd Oct. 17, 1865.
7	Bain, R. A., Serg't, K, 24th Michigan.	Dec. 13, 13, '62.	Right; flap; by Surg. J. H. Beach, 24th Mich. Dis. Feb. 14, '63; pen'd.	27	Bryant, J. E., Pt., I, 24th Michigan.	Dec. 13, 13, '62.	Left; circ.; by Surg. J. H. Beach. Disch'd Mar. 5, '63; pensioned.
8	Barker, B. F., Pt., K, 93d N. Y., age 19.	June 18, 18, '64.	Left; flap (wound right forearm). Disch'd Nov. 11, '64; pensioned.	28	Brush, D. S., Corp'l, B, 50th Penn., age 42.	June 18, 18, '64.	Right; flap; by Surg. J. C. Lyons, 56th Penn. Disch'd Feb. 2, 1865.
9	Bartlett, N. E., Pt., F, 7th Iowa, age 19.	Oct. 4, 4, '62.	Right. Discharged July 15, '63; pensioned; painful stump.	29	Buckman, G. C., Pt., C, 3d Mass. Bat., age 29.	May 8, 8, '64.	Right; flap (also three fingers left). Pens'd Sept. 16, 1864.
10	Batchelder, J. E., Pt., D, 9th Maine, age 20.	July 14, 14, '64.	Left; by Surg. A. Palmer, 9th Me. Disch'd; pens'd; sound stump.	30	Burger, F. H., Capt., E, 4th Penn. Res.	Sept. 17, 17, '62.	Right flap; by Dr. O. Smith. Must. out June 17, '64; pens'd.
11	Baugh, A., Pt., C, 19th Kentucky.	Jan. 11, 11, '63.	Left; by Surg. J. B. Sparks, 19th Ky. Disc'd Mar. 18, '63; pens'd.	31	Burton, J., Pt., A, 33d Missouri, age 24.	Mar. 30, 30, '65.	Right; by A. Surg. R. Conover. Disch'd Sept. 26, 1865; pens'd.
12	Beck, G., Pt., B, 35th Illinois, age 20.	May 27, 28, '64.	Right; circ.; by Surg. S. B. Hawley, 35th Ill.; gang.; amp. arm Aug. 17th. Pens'd Sept. 17, '64.	32	Callahan, P., Pt., D, 4th N. J. Bat., age 26.	Aug. 16, 16, '64.	Right: circ. (Sept. 6, lig. brachial). Disch'd Oct. 21, '65; pensioned.
13	Beebe, H. H., Pt., C, 23d Michigan, age 23.	May 14, 14, '64.	Right; circ.; by Surg. D. L. Heath, 23d Mich.; gangrene. Disch'd Nov. 15, 1864; pensioned.	33	Carpenter, L., Pt., H, 14th Ohio.	Sept 19, 19, '63.	Left: flap; by Surg. G. E. Sloat. Disch'd Feb. 15, 1864; pens'd.
14	Benson, J. L., Pt., F, 66th New York.	Dec. 13, 13, '62.	Left; circ.; by Surg. C. S. Wood, 66th N.Y. Dis. Mar. 5, '63; pen'd.	34	*Carson, E. B.*, Lieut., B, 16th Ala., age 35.	Nov. 30. Dec. 1, 1864.	Left; ant.-post. flap; by Surg. McMahon, 16th Ala. To Prov. Marshal January 3, 1865.
15	Bertram, H., Pt., H, 21st Missouri, age 27.	April 6, 6, '62.	Left. Discharged Nov. 4, 1862; pensioned.	35	Cassidy, J. E., Pt., K, 4th Artillery, age 33.	Mar. 31, 31, '65.	Left; oval flap (right; middle; oval flap); by Surg. W. S. Thompson, U. S. V. Disch'd June 21, 1865; pensioned.
16	Bettis, G. W., Pt., E, 14th Indiana.	Aug. 7, 7, '61.	Right; flap; by Surg. J. G. McPheeters, 14th Ind. Dis.; pens'd.	36	Cavenaugh, P., Pt., D, 9th New York.	Sept. 17, 17, '62.	Right: flap; by Surg. G. H. Humphrey. Pens'd May 7, 1863.

846	Smith, E. A., Pt., H, 27th C. T., age 20.	July 30, 30, '64.	Right; circular; by Surg. F. M. Weld, 27th C. T.; necrosis. Disch'd Oct. 21, 1865; pensioned.
847	Smith, J., Pt., C, 8th New Hampshire.	June 14, 15, '63.	Left; circular. Discharged July 29, 1863.
848	Smith, J. F., Serg't, F, 4th Iowa.	Dec. 29, 29, '62.	Left; circ.; by A. Surg. A. Shaw. Pens'd Feb. 18, 1863.
849	*Smoot, J. F.*, Pt., F, 46th Tenn., age 30.	Nov. 30, 30, '64.	Circular. To Prov. Mar. Jan. 23, 1865; stump almost healed.
850	Sneed, G. W., Pt., A, 12th Ky., age 24.	Aug. 6, 7, '64.	Right; by Surg. A. M. Wilder, U. S. V. Pens'd March 5, 1865.
851	Snowden, S., Pt., A, 36th C. T., age 25.	July 13, 14, '64.	Right; circular; by Surg. J. P. Prince. Disch'd May 17, 1865.
852	Snyder, A., Corp'l, D, 12th Indiana.	Dec. 15, 16, '64.	Left; flap; by A. Surg. J. H. Thorpe, U.S.V. Dis'd; pens'd.
853	Stanford, R., Serg't, K, 63d Pa., age 28.	May 5, 6, '64.	Left; flap; by Surg. Z. R. Jones, 63d Pa. Pens'd Dec. 24, 1864.
854	Stone, E., Pt., K, 25th Massachusetts.	May 16, 16, '64.	Left; double flaps; by Surg. O. F. Marsden, C. S. A. Dis'd; pens'd.
855	Stoughton, A. F., Corp'l, C, 5th Vermont, age 18.	May 12, 14, '64.	Right; doub. flap; by Surg. A. H. Chessmore. Pens'd Jan. 13, '65.
856	Stratton, W., Pt., D, 183d Pa., age 18.	May 10, 11, '64.	Right; flap. Disch'd Dec. 25, 64; pensioned; healthy stump.
857	Sullivan, D., Pt., I, 35th Massachusetts.	Dec. 13, 14, '62.	Right; flap. Disch'd March 5, 1863; pensioned; good stump.
858	*Sutton, N. G.*, Pt., I, 1st Georgia, age 26.	Aug. 6, 6, '64.	Right; flap. To Provost Marshal April 1, 1865.
859	*Sweat, F. R.*, Corp'l, E, 26th Georgia.	July 9, 9, '64.	Left; circ.; by Surg. Gelks, 26th Ga. Exchanged Sept. 19, 1864.
860	*Taggart, M. W.*, Serg't, H, 11th Ala., age 19.	July 2, 2, '63.	Left. Exchanged March 3, 1864.
861	Taylor, M., Pt., I, 198th Pennsylvania, age 18.	Oct. 2, 2, '61.	Left; flap. Discharged Jan. 30, 1865; pensioned. *Spec.* 247.
862	Thomas, F., Pt., E, 12th Pennsylvania.	Sept. 17, 17, '62.	Left; flap. Disch'd Dec. 31, '62; pensioned; stump sore.
863	Thomas, F., Pt., F, 1st C. T., age 39.	June 15, 16, '64.	Left; flap. Disch'd Feb. 10, '65; pensioned; healthy stump.
864	Thompson, D., Pt., F, 1st C. T., age 39.	May 18, 18, '64.	Right; circ.; by Surg. J. W. Wishart, 140th Pa. Disc'd May 27, '65.
865	Thompson, H., Pt., H, 69th N. Y., age 36.	July 19, 20, '64.	Right; flap. Duty Oct. 5, 1864; stump entirely healed.
866	Thompson, R. S., Pt., E, 18th V. R. C., age 26.	July 30, 31, '64.	Right; circ.; by Surg. E. Jackson, 30th C. T. Pens'd Jan. 9, 1865.
867	Thompson, W. H., Pt., I, 30th C. T., age 32.	May 4, 6, '62.	Left; flap (also wound of thigh). Discharged October 1, 1862.
868	Tindell, D., Pt., E, 74th New York, age 26.	Dec. 13, 13, '62.	Right; flap. Disch'd Feb. 6, '63; pensioned; stump healed.
869	Trask, N., Pt., F, 26th New York.	Feb. 7, 7, '63.	Right; circular; by A. Surg. J. H. Kimball and S. G. Holt, 15th Me. Disch'd June 9, 1863; pens'd.
870	Triekey, F. B., Pt., H, 15th Maine, age 23.	July 4, 4, '65.	Left; circ. (amp. right forearm); by A. Surg. C. P. Ulrich, of regiment; July 11, re-amp. middle third forearm. Dis'd Aug. 23, '65.
871	Tucker, J. B., Serg't, B, Green River Battalion, Ky. State Troops.	Aug. 16, 16, '64.	Left; circ.; by Surg. E. Jackson, 30th C. T. Pens'd Feb. 10, '65.
872	Turner, P., Pt., C, 19th C. T., age 29.	Oct. 19, 20, '64.	Left; flap; by A. Surg. C. H. Allen, 8th Vt. Pens'd Aug. 7, '65.
873	Turpin, R., Pt., C, 3d Mass. Cav., age 22.	Nov. 16, 18, '63.	Left; by Surg. G. B. Coggswell, 29th Mass. Disch'd; pens'd.
874	Tyler, J., Capt., G, 17th Michigan, age 38.		

No.	Name, Age, and Military Description	Dates.	Operations, Operator, Result.
875	Vail, I. S., Pt., K, 31st Maine.	June 24, 24, '64.	Left; by Surg. J. B. Mitchell, 31st Me. Disch'd Mar. 1, '65; pens'd.
876	Vance, I., Lt., C, 140th Pennsylvania.	July 3, 3, '63.	Left; circular. Discharged January 12, 1864.
877	Vandercook, G., Pt., H, 115th N. Y., age 23.	Aug. 19, 19, '64.	Right; flap. Disch'd Dec. 5, '64; pensioned; stump healed.
878	Van Gordon, A. M., Pt., H, 9th N. J., age 22.	June 3, 4, '64.	Left; circular. Disch'd September 23, 1865.
879	Wakefield, J., Pt., D, 41st Ohio.	May 27, 28, '64.	Right; circular. Disch'd; pensioned; sound stump.
880	Warner, G. S., Pt., F, 13th Ohio Cav., age 19.	April 7, 7, '65.	Right; circular. Disch'd July 28, 1865; pensioned; stump healed.
881	Warren, G., Pt., F, 26th Massachusetts, age 21.	May 6, 6, '64.	Right; flap; by Surg. N. Hayward, 26th Mass. Disch'd Dec. 30, 1864; pensioned.
882	*Wheeler, H. C.*, Capt., 2d N. C., age 22.	July 1, 1, '63.	Right (wound of left thigh). To prison April 11, 1864.
883	Whipple, J. F., Pt., L, 1st Mass. H. A., age 23.	April 10, 10, '65.	Right; flap; by Surg. C. N. Chamberlain. Pens'd July 5, 1865.
884	White, G. Q., Pt., B, 1st Illinois Artillery.	Nov. 7, 7, '61.	Right; flap. Disch'd Jan. 18, '62; pensioned; stump healed.
885	White, T. H., Pt., B, 2d Pa. H. A., age 18.	June 22, 22, '64.	Left; flap. Disch'd July 27, '65; pensioned; unsound stump.
886	Whitley, W. W., Pt., F, 85th Indiana, age 29.	July 3, 3, '64.	Left. Discharged September 28, 1864; pensioned.
887	Williams, A. J., Pt., H, 22d Illinois.	Dec. 31, 31, '62.	Right. Discharged April 27, '63; pensioned; stump healed.
888	Winn, R., Pt., G, 82d C. T., age 28.	April 3, 3, '65.	Left; flap. Disch'd August 7, 1865.
889	Wood, B., Corp'l, M, 6th N. Y. Artillery, age 47.	May 30, 31, '64.	Right; circular. Disch'd Jan. 30, 1865; pens'd; stump good.
890	Woodworth, C. R., Pt., K, 52d N. Y., age 32.	May 10, 10, '64.	Left; flap. Disch'd July 30, '64; pensioned; good stump.
891	Wright, L., Pt., A, 31st Colored Troops.	July 30, Au. 1, '64.	Left; circ.; by Surg. D. MacKey, 29th C. T. Disch'd Jan. 12, '65.
892	Yeoman, S. B., Capt., A, 54th Ohio.	Jan. 11, 11, '63.	Right; by Surg. J. S. McGrew. Resigned June 8, '63; pensioned.
893	Anderson, O. A., Pt., K, 8th Wisconsin.	Oct. 4, 4, '62.	Left. Discharged May 5, 1863.
894	Bradford, J., Corp'l, I, 32d New York.	Dec. 13, 13, '62.	Right. Duty March 3, 1863.
895	*Durmany, H. S.*, Pt., I, 2d Florida, age 22.	July 2, 2, '63.	Right (wound of right foot). Paroled August 22, 1863.
896	Ellis, G. W., Lieut., 2d New York Cavalry.	April 1, 1, '65.	Left. Mustered out June 5, 1865.
897	Gardiner, A., Pt., B, 71st Pennsylvania.	May 31, J'e 1, '62.	Left. Discharged January 23, 1863.
898	*Gooding, W. B.*, Capt., K, 22d N. C.	July 1, 1, '63.	Left; by Surg. P. G. Robinson, 22d North Carolina.
899	Hamer, C., Pt., A, 29th C. T., age 32.	Oct. 1, 1, '64.	Left. Discharged May 16, 1865.
900	*Luscomb, J. L.*, Pt., C, 18th Va., age 29.	July 1, 1, '63.	Right. Paroled August 22, 1863.
901	Meusch, W., Corp'l, B, 160th N. Y., age 21.	Oct. 27, 27, '64.	Right; by Surg. G. C. Jarvis, 7th Ct. Pens'd Jan. 26, 1865.
902	*Miller, R. J.*, Pt., A, 1st Tennessee, age 31.	July 3, 4, '63.	Right; erysipelas. Paroled Sept. 25, 1863.
903	*Norton, W.*, Pt., C, 63d Tennessee.	May 16, 16, '64.	By Surg. C. B. Gibson, C. S. A. Transferred; doing well.
904	*Paxton, R. E.*, Pt., E, 9th Mississippi, age 20.	May 15, 15, '64.	Furloughed May 29, 1864; convalescent.
905	Shea, T., Major, 22d Indiana.	July 19, 19, '64.	Left. Duty October 13, 1864.
906	Shepherd, J. Q., Pt., B, 33th Iowa.	June 28, 28, '63.	Left; by Surg. P. N. Woods, 33th Iowa. Pens'd March 27, 1864.
907	*Sutlong, J. H.*, Serg't, G, 2d Florida, age 27.	July 2, 2, '63.	Right (flesh wound of shoulder). To Prov. Marshal Sept. 1, 1863.
908	Welply, J. H., Pt., K, 1st Missouri Light Artillery, age 24.	Aug. 10, 10, '61.	Left; by Surg. E. C. Franklin, 5th Mo. Aug., '61, amp. arm. Pens'd. April 26, '64. Died July 16, '68.
909	*Wilson, W. H.*, Serg't, C, 59th Ala., age 30.	May 16, 16, '64.	Circular; stump healed. Furloughed June 3, 1864.
910	Wright, J., Pt., F, 8th Alabama, age 34.	May 8, 8, '64.	Furloughed June 7, 1864.

§ *Fatal Primary Amputations in the Forearm.*—Of a thousand and seven cases, ninety-seven, or 9.6 per cent., were fatal—several after re-amputation.

Case 1926.—Private *I. Neill*, Co. D, 16th Mississippi, aged 38 years, was wounded at the Weldon Railroad, August 21, 1864. From a field hospital he was admitted to the Depot Hospital, Fifth Corps, City Point, where Surgeon W. L. Faxon, 32d Massachusetts, recorded: "Gunshot wound of arm; amputation." Assistant Surgeon J. C. McKee, U. S. A., reported the man's admission to Lincoln Hospital, Washington, August 24th, and the following history: "Gunshot fracture of left forearm, lower third, followed by amputation at the middle third. The operation was performed by Assistant Surgeon J. T. Duffield, 7th Indiana, on the day after the injury, by the circular method. The stump continued in a very unhealthy condition until April 12, 1865, when it was re-amputated by Acting Assistant Surgeon N. A. Robbins, by a circular operation at the lower third of the humerus. (Compare Case 26, Table LXXXVII, p. 788.) On the evening of the following day the patient received a severe shock on the stump by one of the attendants in the ward falling with his whole weight upon the injured member. On the next morning he commenced to fail rapidly, and the same day he was taken with a severe chill with diagnostic signs of pyæmia. Quinine exhibited in large doses failed to produce the desired effect, and the chills continued. A large abscess formed over the external aspect of the knee joint, containing dark and fetid pus. The general treatment consisted of water dressings and tonics, with a solution of bisulphate of soda, half an ounce to six ounces of water, given in doses of two teaspoonfuls every three hours, after the development of pyæmia. The patient died April 17, 1865." The specimen, represented in the annexed cut (Fig. 712), consists of the upper thirds of the bones of the forearm, and was contributed by Acting Assistant Surgeon J. P. Arthur. "Each bone is enlarged, but carious, and superficial diseased action occupies nearly the whole of the shaft of the ulna."

Fig. 712.—Re-amputated stump of the left forearm. *Spec.* 64.

Table CXXXIV.

Condensed Summary of Ninety-seven Fatal Cases of Primary Amputations in the Forearm.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Acox, C., Pt., B, 124th Illinois.	Feb. 6, 6, '64.	Left; circ. (both knees); by Surg. A. H. Brundage. Died Mar. 7, '64.
2	*Baldridge, J. C.*, Pt., B, 6th Mississippi, age 26.	Nov. 30, Dec. 1, '64.	Right; ant.-post. flap. Died Jan. 27, 1865, typhoid fever.
3	Boyer, J., Pt., G, 23d Colored Troops.	Sept. 20, 20, '64.	Left; flap. Died November 15, 1864.
4	Butler, T., Pt., C, 9th Minnesota, age 23.	July 4, 4, '63.	Right (other injuries); by Dr. A. Müller; gang.; delirium. Died July 14, 1863.
5	Crane, S., Pt., I, 55th Pennsylvania, age 17.	June 18, 18, '64.	Left; flap; by Surg. G. T. Stevens. Died Feb. 4, '65, hypertrophy of heart; acute phthisis; pleurisy.
6	Calwell, A. N., Pt., E, 1st R. I. Artillery.	Nov. 7, 7, '63.	Right, and op. arm; by A. Surg. H. G. Taylor. Died Nov. 7, '63.
7	Cone, J., Pt., B, 55th Pennsylvania, age 45.	June 3, 3, '64.	Right; flap (wound of neck). Died June 12, 1864, exhaustion.
8	Dilley, J., Pt., B, 1st N. Y. Lt. Art., age 34.	April 2, 2, '65.	Right; circular; necrosis. Died April 29, 1865, pyæmia.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
9	Dudley, J., Pt., E, 9th Colored Troops, age 28.	Oct. 13, 13, '64.	Left. Died October 18, 1864, exhaustion and pneumonia.
10	Hall, E., Pt., D, 1st Mass. H. A., age 31.	May 19, 19, '64.	Right; ant.-post. flap; sloughed. Died June 9, 1864, pyæmia.
11	Howard, J., Pt., H, 12th Illinois.	July 31, 31, '64.	Left; flap; by Surg. J. Pogue, 66th Illinois. Died Sept. 19, 1864.
12	Huntress, C. T., Pt., C, 1st Mass. H. A., age 44.	May 23, 23, '64.	Right; flap (other w'ds); by Surg. M. Rizer. Died June 18, 1864, pyæmia.
13	Jackson, A., Pt., G, 55th Massachusetts.	Feb. 10, 10, '65.	Right. Died March 5, 1865, inflammation of lungs.
14	Kelly, E., Pt., B, 47th Colored Troops, age 30.	Mar. 5, 6, '64.	Right; circ.; by Surg. N. N. Horton, 47th C. T. Died June 20, '64.
15	Moore, J. C., Corp'l, D, 2d N. Y. Art., age 19.	June 16, 16, '64.	Right. Died July 20, 1864.
16	Price, R. S., Pt., B, 1st N. J. Art., age 25.	July 3, 4, '62.	Right; amputat'n leg; diarrhœa. Died Aug. 22, 1863, exhaustion.
17	Scott, E. J., Pt., F, 111th New York, age 20.	May 5, 6, '64.	Left. Died June 3, 1864, pyæmia.
18	Smith, L., Corp'l, C, 111th Illinois, age 25.	July 22, 22, '64.	Left; circ.; by Act. Staff Surg. C. B. Richards. Died Aug. 20, '64.
19	Smith, L., Pt., G, 81st Pennsylvania, age 39.	July 3, 3, '64.	Left; circular. Died September 14, 1864, consumption.
20	Stamp, C., Pt., H, 94th Ohio.	May 7, 7, '64.	Right; also wound of left thigh. Died June 27, 1864.
21	Stockwell, L., Pt., D, 1st N. Y. Lt. Art., age 45.	Mar. 31, 31, '65.	Right; lateral flap. Died May 14, 1865, exhaustion.
22	Taylor, A., Serg't, I, 97th Ohio.	June 22, 22, '64.	Left; by Surg. E. B. Glick, 40th Indiana. Died June 27, 1864.
23	Trumbull, S. H., Pt., G, 24th N. Y. Cav., age 30.	June 26, 26, '64.	Left; circ.; by Surg. W. C. Shurlock, 51st Pa. Died July 19, '64.
24	Vosburgh, A. P., Pt., 18th N. Y. Battery.	April 8, 8, '65.	Right; by Surg. V. B. Kennedy, 5th Minn. Died May 11, 1865.
25	Walker, P., Pt., I, 104th New York, age 40.	June 18, 18, '64.	Left; circular; amp. right arm. Died July 9, 1864, exhaustion.
26	Webster, W. H., Pt., B, 66th Illinois.	May 27, 27, '64.	Right. Died July 6, 1864, exhaustion from suppuration.
27	Adams, P., Pt., E, 10th New Jersey, age 18.	June 1, 1, '64.	Right; flap. Died of typhoid fever while on furlough.
28	Benner, O. P., Pt., I, 19th Maine.	Oct. 25, 25, '62.	Left. Died Jan. 20, 1863, small-pox.
29	*Boothe*, W., Pt., K, 29th Alabama, age 38.	Dec. 15, 15, '64.	Right; antero-posterior flap. Died Dec. 23, 1864, exhaustion.
30	Brady, J. A., Pt., K, 28th Pa., age 18.	July 4, 4, '64.	Left; circ.; stump healing finely. Died August 10, 1864, pyæmia.
31	Burke, R., Pt., G, 131st New York.	Sept. 19, 19, '64.	Right.* Died October 27, 1864, pyæmia.
32	Crawford, E., Pt., E, 92d Ill. Mt'd Infantry.	Aug. 28, 28, '64.	Died October 4, 1864.
33	Crotty, D., Pt., G, 73d New York, age 28.	June 3, 3, '64.	Left; flap; abscess. Died July 10, 1864, pyæmic symptoms.
34	Dorsey, G., Pt., G, 5th Colored Troops, age 43.	Oct. 27, 27, '64.	Left; by Surg. N. Y. Leit, 76th Pa. Died Dec 7, '64, irri. fever.
35	Fauble, J., Pt., K, 60th New York, age 18.	May 31, 31, '64.	Left; circ.; by Surgs. W. B. Fox, and W. C. Shurlock. Died August 8, 1864. *Spec.* 3071.
36	Ford, S., Pt., H, 13th Kansas.	July 4, 4, '64.	Left; by Surg. C. E. Swasey, U. S. V.; traumatic fever; delirium; slough. Died July 16, 1864, nervous shock.
37	*Hannon, J. H.*, Pt., E, 57th Alabama, age 37.	July 30, 30, '64.	Left; circular. Died Aug. 13, '64, congestive intermittent fever.
38	Hays, D., Corp'l, G, 23d Michigan, age 30.	June 27, 1864.	Right; by Surg. S. K. Crawford, 50th Ohio. Died July 16, 1864.
39	Henry, A., Pt., I, 142d New York, age 31.	Aug. 25, 25, '64.	Right; by Surg. D. McFalls, 142d N. Y.; Sept. 25, amp. arm. Died October 9, 1864, exhaustion.
40	Hoffman, W. H., Pt., C, 110th Ohio, age 26.	May 6, 6, '64.	Left; flap; by Surg. J. D. Osborne. Died July 12, '64, typ. pneum.
41	Hophill, G., Pt., B, 3d Maryland, age 27.	May 12, 14, '64.	Right; circular. Died May 26, 1864.
42	*Jowers, C. P.*, Pt., H, 8th Florida, age 22.	May 3, 3, '63.	Left; circ.; had pericarditis. Died May 24, '63, nervous prostration.
43	Katz, H., Pt., C, 2d Pennsylvania.	June 17, 17, '64.	Right; also contusion of thorax and foot. Died June 21, 1864.
44	Marlnee, J. B., Pt., C, 13th Indiana, age 43.	June 24, 24, '64.	Right. Died July 6, '64, tetanus.
45	*Neill, J.*, Pt., D, 16th Miss., age 38. See Case 1926.	Aug. 21, 22, '64.	Left; circular; by A. Surg. J. T. Duffield, 7th Indiana; April 12, amp. arm. Died April 18, 1865, pyæmia. *Spec.* 64.
46	Nott, R., Pt., G, 43d C. T., age 20.	Oct. 27, 27, '64.	Left; by Surg. M. Tucker. Died Oct. 31, 1864, sec. hæmorrhage.
47	Pedigo, S. W., Pt., G, 38th Illinois, age 27.	July 22, 22, '64.	Left; by Surg. S. H. Kersey, 36th Ind. Died Aug. 22, '64, pyæmia.
48	Scott, E., Pt., F, 111th New York, age 18.	May 10, 12, '64.	Died June 3, 1864.
49	Walker, R. J., Pt., 22d Ind. Bat., age 34.	July 20, 20, '64.	Right; by Surg. J. W. Lawton, U. S. V. Died Sept. 23, 1864.
50	Wallace, R., Pt., F, 33d Missouri.	May 18, 18, '64.	Right, middle; left, lower; by A. Surg. C. H. Andrus, 128th New York. Died May, 1864.
51	Wyckoff, J. J., Pt., G, 15th New Jersey.	April 2, 2, '65.	Left. Died April 13, 1865.
52	Allen, G. W., Pt., C, 32d Mass., age 25.	May 12, 13, '64.	Left. Died June 3, 1864, pyæmia. *Spec.* 3511.
53	Armstrong, T., Pt., A, 130th Pa., age 40.	June 18, 18, '64.	Right; flap; July 6, unhealthy action. Died July 12, 1864.
54	Dehass, H., Pt., B, 11th Pennsylvania, age 49.	June 24, 24, '64.	Left; circular flap. Died Aug. 19, 1864, gangrene.
55	Dijohn, G., Pt., B, 73d C. T., age 29.	April 10, 12, '65.	Left; circular. Died May 2, '65, hectic fever.
56	Fisk, R., Pt., K, 20th Iowa.	Dec. 7, 9, '62.	Tetanus Dec. 17, which increased in severity. Died Dec. 27, 1862.
57	Gallaher, L. G., Pt., A, 126th Ohio, age 19.	May 9, 10, '64.	Right; flap. Died May 27, 1864.
58	Gweeny, H. C., Pt., C, 1st Ohio Artillery.	May 27, 27, '64.	Right; by Surg. J. Bennett, 19th Michigan. Died May, 1864.
59	Hall, S., Pt., B, 30th Colored Troops.	July 30, 31, '64.	Right; circ.; by Surg. J. S. Ross, 11th N. H. Died Aug. 4, 1864.
60	Hollingsworth, J., Pt., H, 3d New Jersey.	Sept. 14, 16, '62.	Right; circular; flesh wounds left arm and thigh. Died November 1, 1862, typhoid fever.
61	Hoyt, F. H., A, 1st Ark., age 34.	May 5, 6, '64.	Left; wound arm; by Surg. J. B. Lamb; diarrhœa. Died July 11, 1864.
62	*Huskey, W. H.*, Corp'l, I, 3d S. C.	Nov. 18, 19, '63.	Left; fract. right clavicle; Dec. 27, exc. clavicle. Died Jan. 24, '64.
63	Kirchenberger, J., Sgt., E, 54th Ohio.	Aug. 3, 3, '64.	Left; by Surg. I. N. Barnes, 116th Illinois. Died Sept. 7, 1864.
64	*Lemoix, L. V.*, Pt., K, 8th Louisiana.	Sept. 19, 20, '64.	Circular; also wounds of both thighs. Died Sept. 29, 1864.
65	Mock, T., Pt., K, 55th Pennsylvania, age 24.	June 18, 19, '64.	Right; flap; by Surg. G. T. Stevens, 77th N. Y.; gang.; July 25, re-amp. Died Aug. 7, '64, pyæm.
66	Moody, S., Major, 27th Michigan, age 44.	June 3, 4, '64.	Right; by Surg. H. C. Smith; tetanic symp. Died June 20, '64.
67	Murray, B., Pt., I, 1st Colored Troops.	June 15, 15, '64.	Right. Died February 2, 1865.
68	Niles, J. W., Pt., A, 2d Vermont, age 27.	May 11, 11, '64.	Right; circ.; w'nd right shoulder; profuse suppuration. Died May 28, 1864, exhaustion.
69	Penny, C., Pt., D, 124th Ohio, age 19.	Dec. 16, 16, '64.	Left; circular. Died January 23, 1865.
70	Phillips, O., Corp'l, A, 7th Rhode Island.	June 3, 3, '64.	Left. Died July 20, 1864.
71	Philo, H., Pt., I, 39th New Jersey, age 33.	April 2, 2, '65.	Right; circular; by A. Surg. E. M. Smyser. Died May 1, 1865, pyæmia.
72	Roe, J. L., Pt., L, 6th Kentucky Cavalry.	June 24, 24, '64.	Left; wound of abdomen. Died June 24, 1864.
73	Spilkey, E. B., Pt., H, 11th Missouri.	Mar. 30, 30, '65.	Left; w'd of thorax; by Surg. M. W. Fish. Died May 26, 1865.
74	Steel, J., Pt., L, 10th Mich. Cavalry, age 18.	May 19, 20, '64.	Left; flap; by Surg. C. S. Frink, U. S. V.; gang. Died May 23, '64.
75	Tompkins, M., Pt., D, 41st Ohio.	May 27, 27, '64.	Left. Died June 21, 1864.
76	Wagner, A. B., Pt., D, 48th Pennsylvania.	April 2, 2, '65.	Left; by Surg. J. H. Kimball, 32d Maine. Died April 15, 1865.
77	Wallace, R., Pt., F, 33d Missouri.	May 18, 18, '64.	Left, lower; right, mid.; A. Surg. C. H. Andrus. Died May, 1864.
78	Weaver, R. A., Serg't, C, 141st N. Y., age 23.	July 23, 23, '64.	Right; circ.; gang.; bones protruded. Died Sept. 1, '64, pyæmia.
79	Western, T., Pt., B, 18th Ohio, age 38.	Dec. 15, 15, '64.	Right; ant.-post. flap; by Surg. B. B. Breed, U. S. V. Dec. 29th, gangrene. Died Feb. 10, 1865.
80	Boyd, J., Pt., I, 2d Delaware.	July 3, 3, '63.	Died July 6, 1863.
81	Campbell, J., Pt., F, 13th New Jersey.	Sept. 17, 18, '62.	Died Sept. 19, 1862, hæmorrhage.
82	Dwilley, S. L., Pt., D, 17th Maine.	July 3, 3, '63.	Right. Died August 8, 1863.
83	*Graham, J. C.*, Pt., F, 4th Texas, age 30.	July 3, 3, '63.	Left; diarrhœa. Died August 29, 1863.
84	Hall, A. J., Pt., I, 27th Illinois.	Nov. 25, 25, '63.	Right. Died December 27, 1863.
85	Hatcher, T., Pt., G, 19th Ohio.	May 27, 27, '64.	Died May 27, 1864.
86	Hutchinson, A., Pt., I, 110th Pennsylvania.	May 3, 3, '63.	Right. Died August 7, 1863.
87	Jacobs, E., Pt., 4th Ohio Battery.	May 14, 14, '64.	Right. Died May 18, 1864.
88	Johnson, C. A., Corp'l, E, 19th Mass., age 18.	July 2, 1863.	Left; gangrene. Died August 19, 1863.
89	Lansdon, R., Pt., F, 72d Illinois.	May 22, 22, '63.	Left. Died July 26, 1863.
90	Lease, J. W., Pt., D, 4th Vermont, age 28.	June 24, 24, '64.	Left. Died July 8, 1864, dysentery.
91	Luthur, J., Pt., G, 2d Rhode Island.	April 17, 18, '62.	Left (pen. w'd abd.); by St. J. W. Mintzer. Died April 18, 1862.
92	Lynne, J., Pt., F, 2d Cavalry.	Sept. 19, 19, '64.	Right. Died September, 1864.
93	Redlow, G. M., Pt., B, 4th Maine, age 18.	Sept. 1, 1, '62.	Left. Died October 19, 1862, pyæmia.
94	Sumner, E., Corp'l, E, 27th Illinois.	Nov. 25, 25, '63.	Left. Died December 27, 1863.
95	Trayer, D. K., Pt., D, 4th Artillery.	Aug. 28, 28, '64.	Right. Died September 19, 1864, typhoid fever.
96	Trell, S. H., Pt., B, 6th Indiana.	May 14, 14, '64.	Left (wounds of head and leg). Died June 9, 1864.
97	Woodcock, G., Pt., C, 53d Pa., age 19.	May 12, 12, '64.	Left (wounds of leg and neck). Died May 23, 1864.

Some series of facts supplied in the two foregoing tables on primary amputations in the forearm for shot injury are consolidated in the foot-note.[1] The injuries in less than a fourth of the cases were from large projectiles or explosions, causing great disorganization.[2]

Intermediary Amputations in the Forearm for Shot Injury.—Of four hundred and fifty operations practised in the interval from the third to the thirtieth day after injury, the results having been ascertained in all instances, a hundred and six, or 23.5 per cent., proved fatal,—an excessive increase over the mortality of the primary amputations.

§ *Recoveries after Intermediary Amputations in the Forearm.*—A single detailed observation may precede the tabular statement:

CASE 1927.—Private J. Sapp, Co. I, 17th Kentucky, aged 22 years, was wounded in the left forearm, while on picket near Brentwood, April 22, 1863. Assistant Surgeon C. C. Gray, U. S. A., contributed the specimen (FIG. 713), and reported the following history: "The ball entered the radial border one and three-fourths inches from the carpus, passed obliquely downward, bisecting the axis of both bones, and escaped a half inch above the carpus. The integuments in the vicinity of the wound were severely burned. (It was supposed that the wound was caused by the accidental discharge of the patient's own weapon, no other explanation appearing for the burn. The man, however, denied this.) He was admitted to Hospital No. 8, Nashville, April 23d, thirty hours after the injury, the arm being in splints, greatly swollen, hot and painful; the fracture badly comminuted, wound gaping, and soft parts everted. Removed the splints and applied cold-water dressings; patient kept in bed with the arm on a pillow. Prescribed one ounce of sulphate of magnesia at once. April 24th, slept well; no pain. Removed two fragments of radius and dressed wound with mixture of Labarraque's solution half an ounce, and camphor-water one pint, applied warm; ordered low diet. 25th, wound sloughy and gangrenous; discharge watery, sanious, and very fetid; pulse 120 and feeble. Isolated the case, and ordered a prescription of sulphate of quinine one drachm, aromatic sulphuric acid sufficient quantity, and simple syrup and water three ounces each, to be given in doses of half an ounce three times a day. Dressed the wound every two hours with compound solution of bromine and injected it; application caused no pain. Gave full diet. 26th, sloughs removed; treatment continued. Takes egg-nog one-half ounce every two hours. 27th, diluted the bromine solution one-half. Tongue moist; appetite good. 28th, separated sloughs; surface granulating. Discontinued bromine, which now causes great pain, and prescribed a mixture of Labarraque's solution one ounce, and camphor-water one pint. 29th, discharge healthy. General condition good. May 12th, granulations profuse; discharge of pus copious. Examination revealing no union and much detached bone, amputated the forearm at middle by double flap. Stump left open for the present and constantly injected. Low diet given, and forty drops of laudanum at night. 13th, reaction decided; pulse 130. Prescribed liquor ammonii acetatis three ounces, and tincture aconite eighteen minims, in doses of half an ounce every three hours. 14th, improving; water dressings applied. From this day recovery was rapid. * * The amputation was made higher than it otherwise would have been, had it not been for the injury suffered by the soft parts in the immediate vicinity of the wound by the burn." The specimen, represented in the wood-cut (FIG. 713), consists of the lower halves of the bones of the forearm, being comminuted two inches above the wrist, with a longitudinal fracture extending down the radius into the joint. The patient was subsequently discharged from Hospital No. 13, August 24, 1863, and pensioned. He died July 22, 1872. The immediate cause of death is not known.

FIG. 713.—Shot comminution of left wrist. *Spec.* 1913.

---

[1] The cases of recovery after primary amputation in the forearm are arranged alphabetically in the three subdivisions, commencing with the amputations in the upper third of the forearm, which numbered 270 cases. The operations in the middle third begin in the second column on page 971, and include 356 cases. The amputations in the lower third commence with No. 627, on page 975, and include 266 operations; 18 cases, in which the point of ablation is not specified, are enumerated on page 978, and complete the series of 910 operations. These amputations were practised on 903 patients,—844 Union and 59 Confederate soldiers. 417 operations were on the right forearm, 475 on the left; in 18 this point was unspecified. There were 385 flap operations, 317 circular, and 208 undescribed amputations. 81 patients had wounds of more or less gravity in other regions of the body.——The 97 fatal primary amputations were practised on 98 patients, Pt. Wallace losing both forearms; 26 of the operations were in the upper, 25 in the middle, 28 in the lower third, and in 18 the point of ablation was unspecified; 43 amputations were on the right, 47 on the left side, and 7 unspecified. In 38 cases in which the method of operating was mentioned, circular incisions were employed in 21. 88 of the patients, including the one who underwent double amputation, were Union, and 8 Confederate soldiers. The approximate causes of death were imperfectly recorded. In 51 cases in which some indication was given, the fatal result is ascribed to tetanus in 3 instances, to shock in 2, to secondary hæmorrhage in 2, to gangrene in 4, to pyæmia in 15, to pneumonia or pulmonary complications in 5, to exhaustion, irritative fever, typhoidal condition in 12, to phthisis in 2, variola in 1, cardiac diseases in 1, to dysentery in 4. Very few autopsies were narrated, and but few specimens were forwarded to the Museum. Besides *Spec.* 64, figured on page 978, *Spec.* 3071 (*Cat. Surg. Sect.*, 1866, p. 192) was furnished by CASE 35 of the TABLE: and *Spec.* 3541 (*ibid.*) by CASE 52; all three specimens are good examples of carious stumps of amputated bones of the forearm. Three succumbed after re-amputation,—two secondary, in the upper arm (CASES 39 and 45 of TABLE CXXXIV, which appear also as CASES 16 and 26 of TABLE LXXXVII, p. 788), and one, CASE 65, re-amputatated higher up in the forearm. 18 of the patients suffered from serious though not mortal wounds in other regions of the body; one of these, CASE 6, underwent amputation of the opposite arm (compare TABLE LXXIII, No. 15, p. 747); another, CASE 25, simultaneous amputation in the upper third of the right arm. In CASE 16 the right leg was synchronously amputated. In another instance the thumb and first metacarpal of the opposite limb were removed at the same time with the forearm amputation

[2] Besides the 199 cases mentioned at page 967, of injuries from large projectiles or from premature explosions of cannon, were 22 cases of dreadful laceration from explosions of ammunition caissons, bursting of cannon, wounds from large splinters, etc. The 221 cases are distributed as follows: From shells or shell fragments, 120 recoveries and 11 fatal cases; in artillery soldiers, from premature explosion of the gun, 51 recoveries and 5 fatal cases; from solid shot or large projectiles, 26 recoveries and 1 fatal case; from torpedoes, caisson explosions, etc., 7 recoveries.

TABLE CXXXV.

Condensed Summary of Three Hundred and Forty-four Successful Intermediary Amputations in the Forearm for Shot Injury.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Bergin, W. S., Pt., A, 121st Ohio, age 16.	June 2, 19, '64.	Right; flap; by A. Surg. C. C. Byrne, U. S. A.; hæmor.; ligat. artery. Pens'd Oct. 25, 1864.
2	Bertram, C., Corp'l, F, 6th Wisconsin.	Sept. 17, Oct. 8, 1862.	Left; by Surgs. B. A. Vanderkieft, U. S. V., and W. B. Chambers, 66th N.Y. Pen'd Jan. 12, '63.
3	*Berine, H. F.*, Pt., C, 45th Tennessee, age 24.	Aug. 31, Se. 14, '64.	Right; circular. Stump entirely healed. To Prov. Mar. Dec. 8, '64.
4	Bramlette, L., Pt., H, 15th Missouri.	Dec. 31, '62 Ja. 15, '63.	Left; circ. (erysipelas); bed sores; ulceration. Disch'd May 21, '63.
5	Briggs, J. S., Pt., D, 27th Illinois.	Jan. 14, Feb. 8, '63	Left; flap; by Surg. A. C. Rankin, 88th Ill. Pens'd March 15, 1863.
6	Butz, G. W., Pt., K, 2d Pennsylvania Cavalry, age 26.	Nov. 29, Dec. 11, 1863.	Left; circular (Nov. 29, amp. part of hand); by A. A. Surg. J. Cass. Pens'd April 25, '64. *Spec.* 1905.
7	Campbell, A., Pt., D, 95th Pa., age 20.	May 3, 20, '63.	Right; by A. A. Surg. W. H. Ensign. Discharged August 10, 1864; pensioned. *Spec.* 1138.
8	Carll, H., Pt., C, 5th Michigan, age 19.	May 25, Je 1, '64.	Left; ant.-post. flap; by A. Surg. A. Delany. Pens'd Nov. 10, '64.
9	Carver, R. E., Pt., C, 179th Ohio, age 18.	Oct. 19, No. 10, '64	Right; circ. (pyæmic); by Surg. J. R. Ludlow, U. S. V. Pens'd.
10	Champion, R. D., Pt., C, 157th New York.	Dec. 9, 27, '64.	Right; circ. (œdematous); by A. A. Surg. E. L. Mola. Pen. May 9, '65.
11	Collins, J., Pt., F, 7th N. Y. H. A., age 29.	May 24, June 4, 1864.	Left (amp. fingers; gangrene); by Surg. D. P. Smith, U. S. V. Disch'd Oct. 11, '64. *Spec.* 3301.
12	Conklin, J. M., Pt., K, 11th Iowa, age 30.	July 22, Au. 11, '64	Right; by Surg. G. L. Lucas, 47th Ill. Pens'd Jan. 23, 1865.
13	Cranshaw, S., Pt., C, 86th N. Y., age 45.	May 31, June 18, 1864.	Left; circ. (prim'y excis.; gang.; hæmor.); by A. Surg. W. Webster, U.S.A. Disch'd Sept. 13, '65.
14	Crosby, J., Pt., I, 2d Vermont, age 21.	May 19, June 15, 1864.	Left; ant.-post. flap (gang.; bone diseased); by A. Surg. W. Webster, U. S. A. Disch'd Dec. 20, 1864; pensioned. *Spec.* 4143.
15	Denzer, J., Pt., C, 61st Pennsylvania, age 21.	Sept. 19, Oct. 6, '64.	Left; circ.; by A. A. Surg. W. P. Moon. Pens'd March 21, 1865.
16	Dougher, J., Pt., I, 7th Pa. Cav., age 26.	April 2, 8, '65.	Right; circ. May 25, stump nearly healed. Disch'd July 9, 1865.
17	Down, A., Pt., A, 1st New Hampshire Cavalry, age 19.	June 29, July 21, 1864.	Right; circ. (soft parts unhealthy); by A. A. Surg. W. C. Pryor. Discharged March 18, 1865.
18	Dukes, G., Pt., B, 97th Pennsylvania.	Aug. 4, 20, '64.	Left; circ.; by A. Surg. C. Wagner. Sept. 20, 1864, amp. arm. Pens'd Jan. 20, '65; stump healed. Died Mar. 14, '67, hæm. of lungs.
19	Elliott, J., Serg't, B, 100th Pennsylvania.	Aug 30, Se. 20, '62.	Left; flap. Discharged Dec. 11, 1862; pens'd; perfectly healed.
20	Faulkner, T. C., Pt., H, 70th New York.	Aug. 30, Sept. 25, 1862.	Left; flap; flesh w'd ubd.; bone carious; by A. A. Surg. J. Ashhurst. Disch'd Jan. 21, 1863; pensioned. *Spec.* 264.
21	Felper, J., Pt., I, 57th Illinois, age 30.	April 6, 9, '62.	Left. Discharged July 5, 1862; pensioned.
22	Finley, J. P., Serg't, D, 4th Iowa, age 34.	Mar. 7, 28, '62.	Right; flap. Stump healed. Discharged Aug. 20, 1864; pens'd.
23	Fitch, B., Pt., I, 20th New York S. M.	July 1 8, '63.	Left; flap; by Surg. R. Longhran, 20th N. Y. S. M. Pens'd Nov. 30, '64; elbow joint anchylosed.
24	Flanders, R. W., Pt., I, 186th N. Y., age 22.	Dec. 5, 14, '64.	Left; flap; by Surg. T. R. Crosby, U. S. V. Disch'd July 19, 1865.
25	Foley, T., Pt., G, 31st New York, age 25.	June 26, Jul. 11, '62	Right; doub. flap; by A. A. Surg. J. R. Ubler. Pens'd Aug. 22, '62
26	*Frazier, E. C.*, Pt., K, 55th N. C., age 33.	July 1, 28, '63.	Left; circ; by A. Surg. B. Stone, U.S.V.; hæm. Exch'd Mar. 3, '64.
27	Fuller, D., Pt., G, 53d Pennsylvania.	Sept. 17, Oct. 5, '62.	Left. Sept. 17, amputation right should. joint. Pens'd Dec. 17, '62.
28	Funke, C., Pt., B, 49th New York, age 24.	Sept. 22, Oct. 13, 1864.	Right; ant.-post. flap; by A. A. Surg. W. P. Moon (prim'y exc.). Disch'd July 4, 1865; pens'd.
29	Gaffney, T. A., Pt., I, 2d New York.	Aug. 28, 31, '62.	Right. Healthy stump. Disch'd December 10, 1862; pensioned.
30	Givins, W. B., Pt., F, 60th Indiana, age 22.	April 8, 11, '64.	Right. Discharged June 16, 1864.
31	Goodenow, C. E., Pt., I, 3d Missouri, age 18.	Jan. 11, 21, '63.	Left; wound of right elbow j-int. Disch'd April 14, 1863; pens'd.
32	Gorman, J., Serg't, E, 2d Pennsylvania Heavy Artillery, age 37.	June 24, July 12, 1864.	Left; antero-posterior skin flap; by A. A. Surg. J. M. Boisont. Discharged December 13 1864.
33	*Handly, J. E.*, Pt., D, 8th Alabama, age 23.	July 2, 16, '63.	Right; circular. To Provost Marshal September 17, 1863.
34	Hanover, U. A., Corp'l, B, 10th Ct., age 39.	April 2, 17, '65	Left; circ.; by A. A. Surg. J. Moneypenny. Disch'd July 15, '65
35	Harris, D., Pt., A, 2d Maryland, age 30.	June 17, Jul. 1, '64.	Left; circ.; by A. A. Surg. F. Livermore. Pens'd Sept. 30, 1864.
36	Harris, M., Pt., G, 12th New York Cavalry, age 19.	April 17, May 3, 1864.	Left; circ.; by Surg. C. A. Cowgill (April 25, amputation of finger of right hand). Discharged.
37	Harrison, J. C., Pt., B, 52d Ohio, age 29.	May 11, 26, '64.	Right; circular; by A. Surg. J. A. Freeman, U.S.V. (hæms.); gang. Disch'd Aug. 31, 1865; pens'd.
38	Harvey, F. A., Serg't, B, 155th Pa., age 30.	June 18, Jul. 3, '64.	Right; circ.; by A. A. Surg. G. Badger. Pens'd Sept. 25, 1864.
39	Henry, W., Pt., A, 88th New York, age 31.	May 31, June 17, 1864.	Left; skin flap, circ. sec. muscles; by A. Surg. W. Webster, U. S. A. (May 31, '64, exc. rad. and ulna; gangrene). Pens'd July 27, '65.
40	Hinekman, W., Corp'l, B, 5th N. Y., age 25.	Aug. 19, Sept. 14, 1864.	Left; ant.-post. flap; by A. Surg. J. C. McKee (sec. hæm., lig. brachial). Pens'd Mar. 11, 1865.

253	Walden, C. G., Pt., D, 49th Illinois.	Feb. 14, Mar. 11, 1862.	Left; flap; by Dr. J. W. Coatsworth. Discharged Sept., 1862; pensioned; stump healed.
254	Waterhouse, A. P., S'g't, F, 44th Indiana.	April 6, 18, '62.	Right (hæm.); by A. A. Surg. D. Morgan. Disch'd; pensioned.
255	White, J., Pt., E, 11th Massachusetts	May 4, 25, '64.	Left; by A. A. Surg. H. B. Knowles. Disch'd May 25, 1865; pens'd.
256	Whitney, H. P., Pt., A, 39th Illinois, age 25.	June 2, 22, '64	Right; circ. (June 2, amp. finger; gang.); by A. A. Surg. O. W. Peck. Pens'd June 12, 1865.
257	Wilkin, J., Pt., I, 98th Ohio.	Oct. 8, 12, '62.	Left; flap. Disch'd Nov. 18, '62; pensioned; stump healed.
258	Williams, C., Pt., L, 8th Illinois Cavalry.	July 11, 25, '64.	Right; circ.; by Surg. A. Hard, 8th Ill. Cav. Pens'd Feb. 4, 1865.
259	Winnans, S. H., Serg't, G, 81st N. Y., age 21.	June 2, 16, '64.	Right; skin flap; by A. A. Surg. H. Craft. Pens'd Mar. 18, 1865.
260	Wise, J. E., Pt., A, 36th C. T., age 33.	Sept. 29, Oct 3, '64.	Left. Discharged November 22, 1865; pensioned.
261	Woodward, J. N., Pt., B, 1st Vermont Artillery, age 20.	Sept. 19, Oct. 1, 1864.	Left; skin flap; circ. sec. muscles; by A. A. Surg. W. P. Moon. Pens'd Mar. 17, '65. *Spec.* 554.
262	Allen, D. B., Serg't, K, 7th Indiana, age 26.	May 10, 16, '64.	Left; circ.; by Surg. A. F. Sheldon, U. S. V. Dis'd July 11, '64; pen'd.
263	Allen, H., Pt., G, 49th Pa., age 23.	May 10, 25, '64.	Left; ant.-post. flap; by Surg. A. F. Sheldon, U. S. V. Pen'd Feb. 9, '65.
264	Bachellor, W. H., Pt., C, 14th Massachusetts.	June 30, Jul. 10, '63	Left; flap; by Surg. J. H. Baxter, U. S. V. Dis'd Aug. 24, '63; pen'd.
265	Barton, P., Pt., A, 19th Mass., age 17.	May 11, 24, '64.	Right; ant.-post. flap (May 11th, excision); by A. A. Surg. J. O. French. Pens'd Oct. 26, 1864.
266	Belcher, A. N., Pt., B, 47th Ohio.	Sept. 15, 18, '62.	Left; by A. Surg. J. Schenck, 37th Ohio. Pens'd Oct. 27, '62.
267	Bell, J., Pt., K, 16th Maine, age 17.	May 10, 13, '64.	Left; circular. Discharged June 15, 1864.
268	Bergersdorf, F., Pt., A, 13th Missouri.	Apr. 6, 14, '62.	Left; flap. Disch'd March 25, 1863; pens'd; stump sensitive.
269	Boos, L. J., Serg't, B, 6th Pa. Cav., age 24.	May 7, 13, '64.	Right; circ.; by A. Surg. J. C. McKee. Disch'd Nov. 29, '64; pen'd.
270	Broadwell, W. E., Serg't, B, 15th N. J., age 28.	May 3, 13, '63.	Left; circular; by A. Surg. C. A. McCall, U. S. A. Discharged Sept. 26, '63; pens'd. *Spec.* 1083.
271	Brooks, N., Pt., D, 4th C. T., age 19.	Sept. 30, Oct. 3, '64.	Left; flap. Discharged June 24, 1865; pensioned.
272	Buckley, M., Pt., D, 69th New York.	Sept. 17, Oc. 15, '62.	Right; flap; by A. A. Surg. G. W. Dickie. Pens'd May 8, 1863.
273	Burroughs, M., Pt., A, 148th N. Y., age 18.	May 31, June 27, 1864.	Right; double flap (gang.); by A. Surg. H. M. Sprague, U. S. A.; gang.: July, '64, amp. elb. joint. Disch'd Aug. 26, 1864; pens'd.
274	Collin, E. D., Serg't, F, 13th New York.	Sept. 17, 21, '62.	Left; flap. Discharged; good stump.
275	Cornelison, A. J., Pt., G, 56th Illinois.	May 9, 12, '62.	Left. Disch'd June 13, 1862; pensioned; stump healthy.
276	Cotton, J. H., Pt., K, 17th Maine, age 33.	May 6, 11, '64.	Right; circ.; by Surg. O. A. Judson, U. S. V.; flaps sloughed, bones exposed. Disch'd Jan. 11, 1865; pensioned. *Spec.* 2277.
277	Curtis, O. B., Corp'l, D, 24th Mich., age 22.	Dec. 13, 17, '62.	Left; circ.; by Surgs. C. S. Wood and C. Gray. Pens'd Mar. 4, '63.
278	Davis, M., Pt., M, 14th N. Y. H. A., age 21.	June 17, 20, '64.	Left; circular. Disch'd Aug. 28, 1864; pensioned; sound stump.
279	Dillingham, R., Pt., F, 116th Colored Troops.	Mar. 13, 16, '65.	Left; by Surg. D. MacKay, 29th C. T. Discharged May 16, 1865.
280	Dirvans, N., Pt., I, 139th Pennsylvania, age 23.	May 12, June 11, 1864.	Right (May 12, exc. metacarpal; caries); by A. A. Surg. W. H. Randolph. Pens'd Mar. 15, '65.
281	Dowdy, G. S., Pt., C, 6th Kentucky, age 26.	Nov. 25, Dc. 13, '63	Right; circ.; by A. A. Surg. M. L. Herr. Dis'd Mar 28, '64; pens'd.
282	Dresie, N., Pt., C, 8th Kansas, age 28.	July 21, Au. 5, '64.	Left; flap (gang.); by Surg. J. E. Herbst. Pensioned Jan. 23, '65.
283	Dunton, A. A., Corp'l, I, 27th Pennsylvania.	July 4, Au. 1, '63.	Right; flap (necro.); by A. A. Surg. J. P. Agnew. Dis'd Sept. 18, '63.
284	Eagan, J., Pt., B, 1st N. J. Cavalry, age 23.	April 2, 20, '65.	Left; flap; by Surg. E. Bentley; erysipelas. Pens'd July 28, '65.
285	Eiger, J. H., Pt., C, 28th Massachusetts, age 20.	May 18, 28, '64.	Left; flap (hæm.; lig. ulna; May 22, exc. metacarp.; gang.); by Surg. G. L. Fancoast. Pens'd April 13, '65; w'd open 3 years. *Spec.* 2477.
286	Fahlbusch, F., Pt., G, 35th Mass., age 24.	Sept. 30, Oct. 29, 1864.	Left; flap (sloughing); by A. A. Surg. J. N. Smiley. To V. R. C. March 2, 1865; pensioned.
287	Fielding, R., Pt., B, 6th Wisconsin, age 17.	May 5, 8, '64.	Left; circular. Discharged June 10, 1865; pensioned.
288	Frisby, P. W., Pt., D, 31st Iowa.	Jan. 11, 29, '63.	Left; flap; by A. A. Surg. T. T. Smiley. Pens'd Mar. 15, 1863.
289	Fugate, W., Pt., G, 2d West Virginia Cavalry, age 22.	July 20, 28, '64.	Left; ant.-post. flap (recur. hæm.); by Surg. J. B. Lewis; hæmg's. Duty Jan. 4, 1865; pensioned.
290	Gaunt, B., Pt., A, 12th New Jersey, age 26.	June 3, 6, '64.	Right; flap; June 30, hæm.; lig. rad. Disc'd Oct. 26, '64; pens'd.
291	Gibson, E. E., Lt., D, 2d Michigan, age 31.	June 17, July 13, 1864.	Left; circ. (gangrene); by A. A. Surg. J. Merris. Disch'd Sept. 24, 1864; pens'd. *Spec.* 2834.
292	Gunther, T., Pt., F, 41st New York.	Aug. 30, Sep. 6, '62.	Right; flap. Discharged January 17, 1863.
293	Hall, H. M., Pt., K, 12th W. Va., age 29.	May 15, 24, '64.	Left; circ.; by Surg. J. B. Lewis. Pens'd Jan. 17, '65. *Spec.* 4274.
294	Hawthorne, A. F., Pt., D, 1st Pa. Reserves.	June 30, Jul. 4, '62.	Right; by A. A. Surg. K. Goddard. Dis'd July 12, '62; pens'd.
295	Henderson, H., Corp'l, H, 21st Ohio, age 21.	July 9, 30, '64.	Right; flap (July 9, amp. fingers; gang.); by A. A. Surg. H. Bishop; four inches necrosed ulna removed. Dis'd Apr. 27, '65; pen'd.
296	Hoff, D., Corp'l, G, 65th Ohio.	June 27, Jul. 27, '64	Right; by A. A. Surg. S. C. Ayres. Disch'd Dec. 10, 1864; pens'd.
297	Howell, T., Pt., C, 19th Ohio, age 22.	June 22, July 14, 1864.	Left (gang.); by A. A. Surg. C. S. Merritt; erysipelas. Discharged September 22, 1864.
298	Johnson, S., Pt., D, 6th N. Y. Artillery, age 39.	July 1, 24, '64.	Left; circ. (gang.). Disch'd Dec. 26, '64; pens'd; healthy stump.
299	Keis, J., Pt., E, 1st Michigan Cavalry, age 30.	Oct. 19, Nov. 14. 1864.	Right; ant.-post. flap; by A. A. Surg. M. M. Townsend. Died May 12, 1865, of malarial fever.
300	Lambert, W. D., Pt., H, 27th Michigan, age 19.	June 3, 8, '64.	Left; double flap. Discharged October 5, 1864.
301	Layton, T., Pt., D, 3d Wisconsin.	Aug. 9, 16, '62.	Right; double flap; by A. A. Surg. G. B. Mackenzie. Disch'd Oct. 14, 1862; pens'd. *Spec.* 49.
302	Martinek, F., Pt., E, 9th Mo. S. M. Cavalry.	Aug. 15, 29, '62.	Left; by Surg. T. J. Bluthardt, 23d Mo. Pens'd Feb. 19, 1863.
303	Martz, L., Corp'l, B, 184th Pa., age 39.	June 5, 30, '64.	Right; flap (June 5, amp. finger; gang.); by A. A. Surg. J. G. F. Strowbridge; hæm.; necro. Apr. 9, '65, amp. arm. Pens'd June 26, 1865. *Specs.* 551, 2672, 4170.
304	*Mathews, R.*, Corp'l, E, 18th Georgia.	April 7, 26, '65.	Right; circ. (amp. hand); by A. A. Surg. N. A. Robbins. Released May 18, 1865.
305	McFalls, A., Pt., C, 157th Pa., age 21.	June 3, 15, '64.	Left; flap; by Surg. E. Bentley, U. S. V. Feb. 27, '65, amp. arm. Disch'd Aug. 2, 1865; pens'd.
306	McGarry, N. S., Pt., B, 6th Maine, age 23.	Nov. 7, Dec. 4, 1863.	Right; flap (frac. scap.; hæm.); by A. A. Surg. C. F. Trautman. Pens'd Feb. 15, '64. *Spec.* 2626.
307	McGary, T., Pt., A, 12th West Virginia.	May 19, June 2, '64.	Right; by A. Surg. J. L. Brown, 110th Ohio. Pens'd Dec. 19, '64.
308	McMinn, J., Pt., A, 129th Indiana, age 27.	Mar. 19, April 8, 1865.	Right; circ.; by A. A. Surg. H. Sanders. Discharged June 30, 1865; pensioned; healed.
309	McPhee, D., Pt., H, 20th Massachusetts.	Dec. 11, 24, '62.	Left; flap; by A. Surg. G. M. McGill, U. S. A.; August 11, 1863, bone removed. Disch'd Sept. 21, 1863; pensioned. *Spec.*, 559.
310	Meyer, H., Corp'l, A, 148th Pa., age 23.	May 10, 17, '64.	Left; ant.-post. flap; by Surg. A. F. Sheldon. Pens'd Sept. 12, '64.
311	Mills, G. W., Serg't, E, 5th Michigan, age 22.	Aug. 15, 27, '64.	Left; by Surg. N. R. Moseley. Disch'd Dec. 6, '64. *Spec.* 2252.
312	Murphy, J., Pt., K, 10th N. H., age 48.	June 3, 30, '64.	Left; circ. (amp. finger); by Dr. Furguson. Pens'd Nov. 9, '64.
313	Murray, F., Pt., C, 93d New York, age 50.	Oct. 27, No. 4, '64.	Right; circ.; by A. Surg. H. Allen, U. S. A. Pens'd Feb. 27, 1865.
314	Newcomb, W. J., Corp'l, K, 1st Michigan.	Aug. 30, Sept. 3, 1862.	Left; necrosis; anchyl.; April 3, '63, amp. arm. Disch'd June 9, 1863; pens'd. *Specs.* 1175, 1176.
315	Nichols, U. R., Pt., B, 87th Pa., age 23.	Aug. 12, Sep. 2, '64.	Right (gangrene); by A. A. Surg. A. V. Cherbonnier. Dis'd; pen'd.
316	Owens, R., Pt., C, 100th Pennsylvania, age 24.	May 6, 29, '64.	Left; ant.-post. flap; by Surg. H. Palmer. Disch'd Jan. 20, 1865.
317	Phelps, F., Pt., E, 6th Maryland, age 22.	May 5, 10, '64.	Right; flap; by Surg. D. W. Bliss, U. S. V. Disch'd May 20, 1865; pensioned.
318	Phillips, J., Pt., F, 95th New York, age 19.	May 6, 12, '64.	Left; ant.-post. muscular flap; by Surg. A. F. Sheldon, U. S. V. Disch'd Nov. 19, '64; pensioned.
319	Pogue, W. H., Pt., G, 40th Indiana, age 29.	Nov. 30, De. 4, '64.	Left; flap (wound of head). Dis'd June 24, 1865; pens'd; healed.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
320	Rader, H., Pt., K, 65th Ohio.	De.31,'62. Jan.5,'63.	Left; circ.; by Surg. F. Seymour, U. S. V. Pens'd May 16, 1863.
321	*Reed, R. T.*, Serg't, 48th Georgia, age 19.	July 2, 6, '63.	Right. Paroled September 25, 1863.
322	Reynolds, C. H., Pt., A, 16th N. Y. Cav., age 19.	July 3, 27, '63.	Right; circular; by A. A. Surg. J. Morris. Disch'd Sept. 18, 1865.
323	Roan, D., Pt., H, 148th New York, age 52.	June 2, 10, '64.	Light; ant.-post. flap; by A. Surg. H. Allen, U. S. A. Disch'd Oct. 19, 1864; pens'd. *Spec.* 2943.
324	Robinson, A., Pt., G, 11th N. H., age 24.	Sept. 30, Oct. 21, 1864.	Right; circular; by A. A. Surg. C. W. Carrier. Disch'd July 6, 1865; pensioned. *Spec.* 3522.
325	Rose, J., Pt., B, 6th Tennessee Mounted Infantry, age 28.	Mar. 21, 31, '65.	Right; circular (gang.); by A. A. Surg. J. W. Taylor; April 25, amp. arm. Pens'd June 20, '65.
326	Sanders, T., Serg't, F, 53d Indiana.	Aug. 14, 30, '64.	Left. Discharged April 1, 1865; pensioned; stump healed.
327	Seibel, D., Pt., K, 27th Indiana, age 27.	May 25, June 24, 1864.	Left; circular; by A. A. Surg. C. H. Fisher. Duty December 4, 1864. *Spec.* 3366.
328	Smith, E., Pt., I, 136th Pennsylvania.	Dec. 13, 20, '62	Right; circular. Disch'd March 13, 1863; pens'd; stump healed.
329	Smith, W., Pt., A, 1st Me. H. A., age 18.	June 3, 10, '64.	Right; flap; by Surg. O. A. Judson, U. S. V. Disch'd Feb. 20, 1865; pens'd. *Spec.* 2938.
330	Snow, R. E., Pt., A, 27th Mich., age 25.	May 24, J'e 12,'64.	Left; circ.; by A.A.Surg. T. Carroll. Disch'd July 17,'65; pens'd.
331	Steckman, L., Pt., D, 55th Pa., age 19.	May 16, 22, '64.	Left; circ.; sloughing; necrosis Disch'd June 12, '65; pensioned.
332	Stevens, J. P., Pt., I, 150th Pa., age 21.	July 2, 29, '63.	Left; circular; by A. Surg. D. C. Peters, U. S. A. Discharged September 30, 1863. *Spec.* 168 8.
333	Stoddard, A., Pt., F, 107th N. Y., age 19.	May 25, J'e 4,'64.	Left; circular; by A. Surg. C. C. Byrne. Dis'd Aug. 18, '64; pen'd.
334	Story, J. B., Serg't, H, 103d Pa., age 22.	June 18, 21, '64.	Left; flap (other wound); by Surg. S. F. Chapin, 13th Pa., and L. R. Emberger. Pen'd Dec. 20,'64.
335	Sullivan, T. C., Corp'l, K, 2d Rhode Island.	July 21, 27, '61.	Right; circ. Disch'd Dec. 19, '61; pens'd; stump perfectly healed.
336	Taylor, W., Pt., C, 23d C. T., age 18.	July 30, Au. 4,'64.	Left; circ.; by Surg. D. MacKay. Disch'd March 8, 1865; pens'd.
337	Tucker, W., Pt., C, 27th Michigan, age 22.	May 12, 17, '64.	Right; ant.-post muse. flap; by A. P. Sheldon, U. S. V. Discharged Oct. 25, '64. *Spec.* 2266.
338	Wenger, H. F., Pt., F, 128th New York.	May 27, J'e 9, '63.	Left; flap; by A. A. Surg. J. W. Thomas. Pens'd July 28, 1863.
339	Wright, J. R., Pt., G, 34th Ohio.	Sept. 10, 13, '62.	Left; flap; by Surg. J. E. Finch, 7th Minn. Pens'd April 24,'63.
340	Wyer, B. F., Corp'l, H, 58th Mass., age 37.	May 13, 21, '64.	Left; flap; by A. A. Surg. C. A. Lindsay. Disch'd Oct. 18, 1864.
341	Birge, W. C., Pt., G, 37th Massachusetts.	June 6, 19, '64.	Left; by Surg. R. S. C'rehore; gang.; amp. arm. Pens'd Feb. 28, 1865.
342	Brown, R. N., Pt., G, 23d Massachusetts.	May 16, J'e 9,'64.	Right; amp. arm Sept. 19. Dis'd Feb. 7, '65; pens'd; good stump.
343	Robertson, M., Pt., F, 47th C. T., age 45.	Mar. 5, 15, '64.	Left; by Surg. N. N. Horton, 47th C.T. Disch'd January 12, 1865.
344	Sills, E., Pt., A, 46th Illinois, age 18.	July 7, 27, '64.	Circular; by Surg. E. Powell. Duty Aug.28,'64; stump healed.

§ *Fatal Intermediary Amputations in the Forearm.*—Pyæmia was reported in forty-five of the one hundred and six fatal intermediary operations; secondary hæmorrhage in twenty-eight, gangrene in twenty-five, tetanus in five. There were six amputations.

Case 1928.—Private H. C. Fowler, Co. H, 7th Michigan, aged 22 years, was wounded at Deep Bottom, July 26, 1864, and sent to Lincoln Hospital, Washington. Acting Assistant Surgeon A. F. A. King reported: "The ball entered on the dorsal aspect of the wrist joint, fracturing it and the ulna. Some splinters were extracted on the field. Abscesses extended up the forearm, and, August 15th, amputation was performed at the middle third, eight ligatures being applied. August 17th, stump considerably swollen up to the elbow; discharge scanty. Applied flaxseed poultice. 18th, swelling less; pus discharging abundantly. 20th, complains of night-sweats. Prescribed solution of quinine with elixir vitriol and McMunn's elixir of opium three times a day. 21st and 22d, still doing very well in every respect; no night-sweats; appetite not very good. Treatment the same, with aromatic fluid extract of cinchona three times a day, also a dose of castor oil to open the bowels. 23d, had a severe chill at three o'clock P. M.; arm somewhat swollen; pulse frequent; skin hot. Ordered quinine two grains every two hours. 24th, erysipelas; limb red and œdematous up to the shoulder. Gave muriated tincture of iron ten drops every two hours, and quinine every three hours. 25th, swelling increased. Patient in good spirits though rather weak and feverish. A puffy fluctuating tumor was opened to-day just above the elbow, and contained serum but no pus. Solution of sulphate of iron applied over the arm. 26th, had another chill; arm no better. Patient slightly delirious toward evening. Continued quinine, iron, and stimulants, and ordered tincture of iron and iodine for the arm. 27th, arm less swollen; pus discharged mixed with serum. 28th, arm much better. Patient complains of pain in right breast and has cough. Treatment the same, with cod-liver oil. 30th, had repeated pyæmic chills yesterday and to-day; skin looks yellow, cheeks flushed; great dullness over lower right lung; pain and tenderness over liver; pulse very frequent and weak; delirium at night. Ordered sulphate of quinine five grains, and chlorate of potassæ ten grains every three hours, also brandy egg-nog. 31st, the arm is not much swollen. It has much improved, although the patient is dying of pyæmia. He has great shortness of breath and is partly unconscious all the time. Treatment continued. September 1st, died at one o'clock P. M." A preparation of the bones of the amputated forearm, represented in the adjacent cut (Fig. 714), was contributed by Acting Assistant Surgeon H. M. Dean, who made the following report of a *post-mortem* examination: "The patient was considerably emaciated and of a sallow color. On examining the stump, the tissues were found to be infiltrated with pus. Pus was also found in the elbow joint. The periosteum was readily separated from the bones of the stump. On opening the thoracic cavity the right side was found to contain about twenty-four ounces of opaque fluid, and the lung was covered by a layer of recently deposited lymph. The lower lobe of each lung was carnified, and contained several isolated abscesses about the size of peas. The right lung weighed twenty ounces, the left thirty ounces. The spleen weighed twelve and a half ounces and contained several small isolated abscesses. Pericardium very much thickened and firmly attached to the walls of the heart. Each side of the heart contained a firm yellowish clot; the organ appeared normal. Liver normal, and weighing seventy-six ounces. Both kidneys were very large, but appeared normal, each weighing eight ounces."

Fig. 714.—Caries after shot injury above left wrist. *Spec.* 3087.

TABLE CXXXVI.

Condensed Summary of One Hundred and Six Fatal Intermediary Amputations in the Forearm for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Archibald, J., Pt., F, 33d New York, age 50.	Dec. 13, 1862, Ja. 8, '63.	Right; flap; by A. A. Surg. J. W. Digby; hæm.; diarr. Died Jan. 29, '63, pyæmia. *Spec.* 993.
2	Babcock, A., Pt., F, 1st Sharpshooters, age 38.	June 3, 28, '64.	Left; flap; by Surg. H. Palmer, U. S. V. Died July 1, 1864.
3	Brown, L., Pt., F, 5th New York Cav., age 30.	Oct. 17, No. 1, '63.	Right; circ. (ery.); by A. Surg. R. Bartholow; hæm. Nov. 9, '63, amp. arm. Died Nov. 27, '63, pyæm.
4	Brown, W., Corp'l, I, 1st Mass. Art., age 34.	Mar. 31, Ap. 15, '65	Left; circ. (gang.); R. B. Bontecou; diar. Died Ap. 29, '65, exh'n.
5	Burlay, H. S., Pt., B, 10th Vermont, age 40.	June 5, 18, '64.	Left; circ.; by A. A. Surg. J. Newcombe. Died June 20, '64, exh'n.
6	Button, D., Pt., H, 149th New York, age 35.	May 25, June 12, 1864.	Right; circ.; by A. Surg. J. D. Johnson; gang.; July 21, amp. arm. Died Aug. 16, '64, chr. diar.
7	Carley, H. M., Pt., K, 17th Vermont, age 18.	May 5, 21, '64.	Left; circ.; by A. Surg. D. C. Peters. Died June 15, '64, pyæmia.
8	Carlton, A. H., Pt., D, 26th Maine, age 21.	Apr. 14, May 3, '63	Left (gangrene). Died May 9, 1863, pyæmia. *Spec.* 1294.
9	Contraman, J., Pt., G, 142d Pa., age 20.	May 11, 18, '64.	Left (prim. exc., gang.); by Surg. D. P. Smith. Died May 27, 1864, pyæmia. *Spec.* 3297.
10	Crant, J., Pt., M, 8th N. Y. H. Art., age 17.	June 3, 17, '64.	Left; circ. (hæm., lig.; tetanus); by A. A. Surg. F. E. Marsh. Died June 18, 1864, tetanus.
11	Cummings, N. L., Pt., E, 20th Mass., age 28.	May 6, 19, '64.	Left; circ. (May 6, exc. metacarpal); by Surg. A. F. Sheldon. Died May 26, 1864, toxæmia.
12	Easton, G. O., Pt., C, 175th Ohio, age 18.	Nov. 30, Dc. 18, '64	Right; flap; by Surg. A. M. Speer. Died Dec. 31, 1864, pyæmia.
13	Eble, F., Pt., A, 5th Ohio, age 42.	June 27, July 27, 1864.	Left; ant.-post. flap (amp. finger); by A. Surg. B. E. Fryer, U. S. A. Died Aug. 9, 1864, pneumonia.
14	Ferris, G. W., Corp'l, A, 36th Wis., age 34.	May 27, June 12, 1864.	Right; circ. (May 27, amp. fingers right hand and left arm; hæm.); by A. A. Surg. W. B. Dick. Died June 17, '64, pyæmia.
15	Graham, J., Pt., I, 89th Illinois, age 28.	May 27, June 17, 1864.	Left; circular (hæmor.); by Surg. R. R. Taylor, U. S. V. Died June 30, 1864, pyæmia.
16	Hawkins, W. O., Pt., G, 2d New York Heavy Artillery, age 41.	June 16, July 7, 1864.	Left; circular; by A. A. Surg. E. K. Fill. Died July 12, 1864, exhaustion. *Spec.* 3623.
17	Hollingsworth, S., Pt., F, 73d New York.	July 2, 31, '63.	Left; circular. Died August 17, 1863, pyæmia.
18	Kuhn, J. G., Pt, G, 75th Pennsylvania, age 42	July 1, 29, '63.	Left; flap of skin; circ. of muscle (amp. finger; gangrene). Died August 19, 1863, pyæmia. *Specs.* 2615, 2616, 2773.
19	Liston, J. D., Pt., F, 114th Ohio.	Dc. 29, '62 Ja. 15, '63	Right. Died January 18, 1863, pyæmia. *Spec.* 1037.
20	McGahey, A., Pt., B, 9th Indiana Cavalry, age 18.	Sept. 26, Oct. 14, 1864.	Left; flap; by A. A. Surg. C. S. Merrill; erysipelas. Died Oct. 26, 1864, surgical pneumonia.
21	Pangburn, H. C., Pt., I, 24th Iowa.	June 22, Jul. 9, '63.	Right; July 26, hæmor. Died Aug. 3, '63, intercurrent typhoid fever.
22	Pride, H., Pt., D, 207th Pennsylvania, age 32.	April 2, 11, '65.	Left; circular; by A. A. Surg. A. H. Haven. Died April 12, 1865, pyæmia. *Spec.* 174.
23	Reynolds, H., Pt., H, 5th N. Y., age 32.	Aug. 18, 21, '64.	Right; flap; by Surg. A. A. White, 8th Md.; necrosis; hæm.; Sept. 17, amp. arm. Died Oct. 10, '64.
24	Reynolds, J. K., Pt., C, 148th N. Y., age 44.	June 3, 29, '64.	Right; ant.-post. flap; by Surg. H. Palmer, U. S. V. Died July 17, 1864, pyæmia.
25	Rice, C. H., Pt., E, 5th N. H., age 20.	June 18, Jul. 2, '64.	Left; ant.-post. flap; A. A. Surg. H. M. Dean. Died July 9, '64.
26	Slater, J., Corp'l, K, 7th New York Heavy Artillery, age 20.	June 16, 24, '64.	Right; flap; by A. A. Surg. W. H. Ensign; hæm.; lig. brachial. Died July 8, 1864. *Spec.* 2700.
27	Stevens, L. W., Pt., F, 61st Pa., age 38.	July 13, 31, '64.	Left; circ. (gang.); by A. A. Surg. F. W. Kelly. Died Aug. 23, '64.
28	*Strickland, M. G.*, Pt., G, 50th Ga., age 22.	Sept. 14, Oct. 4, 1862.	Left; flap; hæm.; lig. radial and ulnar; diarrhœa. Died Dec. 3, 1862, pyæmia. *Spec.* 217.
29	Uperoft, J., Pt., K, 62d Pennsylvania, age 21.	May 11, June 6, 1864.	Right; circular (erysip.; hæm.; diarr.); by A. A. Surg. A. A. Smith. Died June 8, 1864; exhaustion. *Spec.* 2755.
30	Urmston, J., Pt., K, 86th Indiana.	Sept. 19, Oct. 6, 1863.	Right; circ.; by Surg. A. M. McMahon, 64th Ohio; hæm.; lig. brach.; pyæm. Died Oct. 21, '63.
31	Walker, R., Pt., F, 71st Pennsylvania, age 26.	June 30, July 20, 1862.	Left; flap (July 17, exc. carpus; aneurism; hæmor.); by Surg. R. H. Coolidge. Died Aug. 10, '62.
32	Baker, W., Pt., G, 117th New York, age 27.	June 3, 10, '64.	Left; circ. (gang.; incip. tetanus); by A. A. Surg. T. L. Van Norden. Died June 19, 1864, pyæmia.
33	Bissell, A. A., Serg't, F, 6th Ohio Cavalry, age 24.	June 24, July 4, 1864.	Right; by Surg. C. Page, U. S. A. Died July 15, 1864, pyæmia. *Spec.* 3326.
34	Blood, H. P., Corp'l, E, 11th New Hampshire, age 19.	Sept. 30, Oct. 28, 1864.	Left; flap; by A. A. Surg. J. C. Morton; gangrene. Died Nov. 8, 1864, exhaustion. *Spec.* 3720.
35	Bunker, W., Pt., I, 66th New York, age 21.	July 22, Aug. 1, 1864.	Right; circ. (gangrene); by Surg. R. B. Bontecou, U. S. V. Died August 8, 1864, exhaustion
36	Collins, J., Pt., C, 18th Illinois.	Dec. 17, 31, '62.	Right; circ (amp. finger Dec. 17; hæmor.); by Surg. H. W. Davis, 18th Ill. Died Jan. 26, 1863.
37	Echtenman, W., Pt., K, 19th Mich., age 22.	May 25, June 1, 1864.	Left; circular (hæmor.); by A. A. Surg. W. H. Kilbourne. Died June 28, 1864, pyæmia.
38	Evans, T., Pt., D, 24th Iowa, age 40.	Oct. 19, 28, '64.	Right; ant.-post. flap; by A. A. Surg. J. Neff. Died November 5, 1864, pyæmia.
39	Fields, J., Pt., K, 4th New York Heavy Artillery, age 27.	June 12, 30, '64.	Right; ant.-post. skin flap; by A. A. Surg. W. H. True. Died July 21, 1864.
40	Follet, G., Pt., K, 8th New York Artillery, age 36.	June 3, 11, '64.	Left; double flap; by Surg. E. Bentley; gang. Died July 6, '64, from w'nd in breast. *Spec.* 2534.
41	Fowler, H. C., Pt., H, 7th Michigan, age 22.	July 26, Aug. 15, 1864.	Left; ant.-post. flap; by A. A. Surg. A. F. A. King. Died Sept. 1, '64, pyæmia *Specs.* 3087, 3100.
42	Francisco, W., Pt., F, 101st N. Y., age 18.	Aug. 29, Se. 23, '62.	Left; by Surg. E. Bentley; irritative fever. Died Oct. 29, '62.
43	Gorman, J., Pt., I, 28th Pennsylvania, age 54.	May 25, J'e 5, '64.	Right; circ. (gang.); A. A. Surg. J. Harvey. Died July 14, '64.
44	Hale, J. M., Pt., B, 12th Kansas.	Aug. 5, 17, '64.	Left; flap (pyæm.; anæm.; hæm.); by Surg. C. E. Swasey, U. S. V. Died Aug. 21, 1864, pyæmia.
45	Hare, E. J., Pt., I, 32d Maine, age 19.	June 24, July 2, 1864.	Right; circular; by A. A. Surg. R. J. S. Nugent. Died July 23, 1864, of hydrops pericardii.
46	Haynes, W., Pt., G, 38th Wisconsin, age 38.	April 2, 9, '65.	Right; ant.-post. skin flap; circ sec. muscles; by A. A. Surg. J. O. French. Died May 1, 1865, pleurisy. *Spec.* 4234.
47	*Hickman, G.*, Pt., H, 33d Mississippi, age 20.	July 20, 25, '64.	Left; circular (diarrhœa). Died Dec. 5, 1861, chronic diarrhœa.
48	Hightower, C. B., Pt., B, 99th Illinois.	May —, 26, '63.	Right (amp'n fingers; necrosis). Died May 29, 1863, exhaustion.
49	Horton, R., Pt., F, 77th Pennsylvania.	July 14, Aug. 10, 1864.	Right (amp. fing.; gang.). Aug. 5, amp. fingers. Died August 14, 1864, pyæmia *Spec.* 3491.
50	Hunt, C., Pt., H, 57th Indiana, age 22.	June 22, July 15, 1864.	Right (June 22, exc ulna; gang.); by A. A. Surg. S. H. Olden; July 19, amp. arm. Died July 21, '64, exhaustion.
51	Jackson, H., Pt., E, 1st Colored Troops, age 20.	June 17, 24, '64.	Right; ant.-post. flap (hæm.); by A. Surg J. H. Frantz, U. S. A. Died June 25, 1864, exhaustion.
52	Jennings, H., Serg't, K, 137th N. Y., age 23.	Oct. 28, No. 8, '63.	Left; circ. (gang.). Died Nov 22, 1863, pyæmia. *Spec.* 2173.
53	Jewell, C. H., Serg't, F, 4th New York, age 24.	Oct. 19, Nov. 7, 1864.	Left; ant.-post flap (hæm.; gan.); by A. A. Surg. T. H. Studdiford Died Nov. 27, 1864, exhaustion.
54	Johnson, N., Corp'l, H, 40th Indiana.	June 27, July 9, 1864.	Left; circular (gangrene); by A. A. Surg. W. N. S. Benjamin. Died August 8, 1864, pyæmia.
55	Kemps, O., Pt., E, 3d New Hampshire, age 33.	Sept. 4, 13, '64.	Left; circ.; by A. A. Surg. W. P. Moon. Died September 24, 1864, pneumonia. *Spec.* 2305.
56	*Keyes, S.*, Corp'l, B, 2d North Carolina, age 27.	July 12, Aug. 11, 1864.	Right; circ. (pen. w'nd of chest; gangrene); by A. A. Surg. N. A. Robbins. Died Sept. 27, 1864.
57	Lape, C., Pt., D, 111th New York, age 18.	May 7, J'e 3, '64	Left; circ.; by A. A. Surg. G. W. Carrier. Died July 6, '64. pyæm.
58	Lindman, A., Pt., A, 63d Pennsylvania.	Nov. 27, De. 13, '63	Right; by Surg. D. P. Smith, U. S. V. Died Dec. 15, '63. *Spec.* 2005.
59	McNeal, D., Pt., G, 63d Pennsylvania, age 29.	May 8, 23, '64.	Left; circ.; Surg. R. B. Bontecou, U. S. V. Died June 11, '64, exh'n.
60	Nesbitt, W. M., Pt., G, 27th Michigan, age 29	May 25, June 1, 1864.	Left; lat. skin flap (gangrene); by Surg. A. F. Sheldon, U. S. V. Died June 11, 1864, exhaustion
61	Patterson, J., Pt., K, 4th U. S. Infantry, age 32.	June 20, 25, '64.	Right; flap. Died August 27, 1864.
62	Peck, W. G., Corp'l, E, 22d New York Cavalry, age 23.	Nov. 12, 30, '64.	Left; antero-posterior flap; by A. Surg. J. M. Houston. Died Dec. 9, 1864, exhaustion.
63	Porter, L. B., Capt., K, 81st N. Y., age 38.	Sept. 29, Oc. 28, '64.	Left; circular. Died November 15, 1864, pyæmia.
64	Prawdcicki, F., Corp'l, B, 7th N. Y., age 31.	Aug. 25, Sept. 19, 1864.	Right; circ. (ery.); by A. A. Surg. T. F. Betton; diarr. Died Oct. 24, '64; exhaustion. *Spec.* 3253.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
65	Ramsdell, J. J., Pt., B, 26th Mass., age 22.	Sept. 19, Oct. 6, '64	Left; circular; A. A. Surg. L. K. Baldwin. Died Oc. 17, '64, pyæm.
66	Rowell, E. W., Pt., B, 19th Maine.	Jan. 22, Feb. 18, 1863.	Diarrhœa. Jan. 22, disart. metacarpal; bone carious; amp. by Surg. N. Hayward, 20th Massachusetts. Died March 4, 1863.
67	Seiber, S., Pt., C, 20th Mass., age 19.	Aug. 25, Sept. 1, 1864.	Left; double flap; by A. A. Surg. W. H. Ensign. Died Sept. 18, 1864, exhaustion. *Spec.* 1484.
68	Shanahan, J., Pt., E, 10th N. Y., age 30.	Oct. 2, 21, '64.	Left; flap; by A. A. Surg. J. C. Morton. Died Oct. 30, 1864, pyæmia. *Spec.* 3719.
69	Skillinger, J. C., Pt., I, 30 N. J., age 20.	May 8, 23, '64.	Right; circ. (hæm.); by A. A. Surg. C. H. Osborne. Died May 31, 1864, pyæmia.
70	Smith, G., Pt., G, 21st Pa. Cav., age 20.	June 22, July 9, 1864.	Left; ant.-post. flap (June 22, amp. finger); by A. A. Surg. W. W. Valk. Sept. 17, amputation arm. Died October 7, 1864.
71	Vanbone, P., Pt., B, 2d New York H. A.	June 2, 13, '64.	Left; ant.-post. flap; by Surg. E. Bentley. Died J'e 25, '64, pyæ.
72	Walter, J., Pt., C, 2d Pa. H. A., age 22.	June 17, July 14, 1864.	Left; circ. (June 19, amp. fing.; gang.); by A. A. Surg. H. Craft. Died Aug. 10, '64, pyæ. *Sp.* 2872.
73	Adams, O. M., Lieut., K, 148th N. Y., age 32.	June 4, 18, '64.	Right; circular; by Surg. D. W. Bliss. Died June 19, 1864, tetanus. *Spec.* 2554.
74	Chatfield, J., Pt., E, 6th Ohio Cav., age 32.	June 21, July 14, 1863.	Right (w'nd left rad.); July 14, hæm.; amp. left arm; by A. A. Surg. C. H. Osborne. Died July 14, 1863.
75	Cook, J. A., Pt., C, 104th Illinois, age 20.	June 18, 28, '64.	Left; circ.; by A. Surg. C. C. Byrne; gang. Died July 19, '64.
76	Davis, A., Pt., E, 32d New York.	May 7, 31, '62.	Circ.; by Surg. A. B. Mott; delirium. Died June 6, 1862.
77	Dingman, D., Pt., E, 27th Michigan, age 23.	June 18, 24, '64.	Left (amp. fingers). Died June 27, 1864, tetanus.
78	Harper, S., Pt., H., 121st N. Y., age 32.	May 6, 18, '64.	Right; circ.; by A. A. Surg. John Ward. Died May 28, '64, pyæm.
79	Harlzell, J., Pt., C, 99th Ohio, age 19.	June 16, July 13, 1864.	Right; circ. (amp. finger; gang.); by A. A. Surg. H. C. May. Died July 18, 1864, exhaustion.
80	Hitchman, A., Pt., D, 67th Pa., age 19.	May 6, 25, '64	Left; circ.; A. A. Surg. R. Ottman. Died June 21, 1864. *Spec.* 2476.
81	Hood, F. A., Corp'l, F, 40th Mass., age 39.	June 3, 16, '64.	Left (hæm.); by A. A. Surg. A. V. Cherbonnier; erysip.; June 26, amp. arm. Died June 27, '64.
82	Hunt, A., Pt., D, 8th Maryland, age 31.	May 9, 14, '64.	Left; ant. post. flap; by Surg. A. F. Sheldon, U. S. V. Died May 22, 1864, pneumonia.
83	Jackson, T., Pt., B, 95th New York, age 19.	Feb. 6, 21, '65.	Left; antero-posterior flap; by A. A. Surg. J. Dickson. Died April 8, 1865, pyæmia.
84	Jones, W. E., Pt., G, 10th New York.	Aug. 9, 16, '62.	Right; flap; by A. A. Surg. W. K. Cleveland. Died Sept. 29, 1862, pyæmia.
85	Kelly, D., Corp'l, H, 6th Wisconsin, age 32.	May 12, 23, '64.	Right; circ. (hæm.); by Surg. R. H. Bontecou. Died June 23, '64.
86	McBride, E., Pt., H, 106th New York, age 34.	Aug. 10, Sept. 3, 1864.	Left; ant.-post. flap (gang.; diarrhœa); by Surg. R. H. Bontecou, U. S. V. Died Sept. 3, '64, exh'n.
87	Miller, J., Pt., B, 11th U. S. Infantry, age 38.	June 18, July 9, 1864.	Left; antero-posterior flap; by A. A. Surg. A. Ansell. Died July 26, 1864, pyæmia.
88	Motherspaw, G. W., Major 73d Illinois, age 33.	Nov. 30, Dec. 12, 1864.	Left; flap; by A. A. Surg. J. A. Hall; erysip.; hæm.; Dec. 18, re-amp. Died Dec. 18, 1864.
89	Norwood, E., Pt., B, 6th Pennsylvania, age 22.	Aug. 29, Se. 25, '62.	Right. Died September 28, 1862, pyæmia.
90	Richardson, R. F., Pt., C, 93d N. Y., age 22.	May 5, 27, '64.	Right; flap; by Surg. O. A. Judson. Died June 23, 1864, exh'n.
91	Rompano, E., Lieut., G, 67th Ohio, age 28.	Oct. 13, 26, '64.	Right; by Surg. D. G. Rush, U. S. V. Died Nov. 14, '64, pyæmia.
92	Spencer, A., Pt., C, 21st Connecticut, age 34.	May 30, J'e 15, '64.	Left; circular; by A. Surg. H. M. Sprague. Died July 12, '64, pyæ.
93	Whitmore, T., Pt., E, 51st Indiana, age 18.	Dec. 16, 26, '64	Left; circ.; by Surg. J. R. Ludlow, U. S. V. Died Jan. 4, '65.
94	Danielson, J. Serg't, F, 11th Connecticut, age 30.	June 3, July 3, 1864.	Left; circular (gang.); by A. A. Surg. A. N. Brockway. Furloughed. Died Oct. 12, 1864.
95	Dilley, A. M., Pt., C, 143d Pennsylvania.	Oct. 19, Nov. 1, 1863.	Left; by A. Surg. R. Barthelow, U. S. A. (amp. finger Oct. 19). Died December 2, 1863.
96	Fry, H., Pt., E, 68th New York, age 24.	May 2, 15, '63.	——; gangrene. Died October 28, 1863, pyæmia.
97	Jacobs, C. W., Corp'l, B, 106th New York.	Dec. 13, 22, '62.	By Surg. E. Bentley, U. S. V. Died Dec. 28, 1862, pyæmia.
98	Jordan, J., Pt., F, 155th New York, age 30.	June 3. 15, '64.	Right; circular (erysipelas); by A. A. Surg. G. O. Moody. Died July 2, 1864, pyæmia.
99	McCracken, J., Serg't, B, 1st Pa. Res., age 22.	June 30, Jul. 11, '62	By A. A. Surg. J. R. Uhler. Died July 14, 1862, ichoræmia.
100	Mullins, J. B., Pt., I, 5th Tennessee Cavalry.	May 18, J'e 2, '63.	Hæmorrhage. Died June 14, '63.
101	Schmall, F., Pt., K, 5th Michigan, age 44.	Oct. 27. No. 18, '64	Left; circular; by Dr. Tinsley, C. S. A. Died.
102	*Taylor, G. S.*, Pt., G, 8th Tennessee.	Sept. 13, 28, '64.	Left. Died November 3, 1864.
103	Weidle, R., Pt., C, 143th Pennsylvania.	May 5, 14, '64.	Died May 15, 1864, tetanus.
104	Wheeler, C. R., Pt., B, 19th Michigan, age 26.	June 21, Jul. 18, '64	Right (June 27, amput'n finger). Died August 3, 1864, pyæmia.
105	Williams, R. F., Pt., C, 125th Pa., age 23.	Sept. 17, Oct. 8, '62.	Right. Died November 13, 1862, pyæmia.
106	*Worden, J.*, Pt., E, 6th Virginia.	June 21, Jul. 6, '62.	Died July 14, 1862, pyæmia.

Secondary Amputations in the Forearm for Shot Injury.—A hundred and eighty-four such operations were reported.

§ *Recoveries after Secondary Amputations in the Forearm.*—One of the hundred and fifty-five cases will be detailed:

Case 1929.—Private W. Green, Co. C. 35th Massachusetts, aged 23 years, was wounded in the right forearm, at Antietam, September 17, 1862, and admitted to Capitol Hospital, Washington, six days afterward. Assistant Surgeon E. DeW. Breneman, U. S. A., contributed the specimen (Fig. 715), and reported the following history: "The ball entered the arm anteriorly one inch above the radio-carpal articulation, on radial aspect, fracturing that bone, and escaped posteriorly at the ulnar aspect, fracturing that bone also. The patient was admitted to Satterlee Hospital, October 12th, his arm in pasteboard splints. It was greatly tumefied and he was in intense pain. Placed the limb upon a straight splint, well padded, and had cold water constantly applied. On the evening of October 19th, secondary hæmorrhage supervened, presumed to be from the radial artery; the forearm was amputated by Acting Assistant Surgeon N. P. Hickman, by the circular method, at the middle third, by the advice of Assistant Surgeon J. S. Billings, U. S. A. I made an examination of the amputated portion and found a comminuted oblique fracture of the radius, commencing an inch from the articulation of the carpus; also a transverse fracture of the ulna, with the formation of a capsular ligament, thus producing a false joint; and a detached portion of the radius driven into the interosseous space and injuring the posterior interosseous artery, from which the hæmorrhage proceeded. Considerable callus was thrown out between the injured portions of each bone posteriorly, and at this part of the radius nature also made an attempt to form a capsular ligament. The radio-carpal articulation was uninjured." This patient was transferred to the care of Assistant Surgeon A. H. Smith, U. S. A., who reports, October 23d, that "he had removed pieces of bone occasionally, and that the wound was nearly healed." The patient was discharged January 17, 1863, pensioned, and was paid September 4, 1875. The specimen (Fig. 715) shows the lower halves of the bones of the forearm, with necrosis of the fractured parts and slight osseous deposits above the lines of necrosis.

Fig. 715.—Necrosed bones of forearm after secondary amputation. *Spec.* 880.

TABLE CXXXVII.

Condensed Summary of One Hundred and Fifty-five Successful Secondary Amputations in the Forearm for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Akin, S., Color Serg't, C, 138th Pa., age 31.	May 6, J'e 18,'64.	Left; doub. skin flaps; by A. Surg. W. F. Norris. Pens'd May 30,'65.
2	Appleby, C. H., Pt., K, 52d Ohio, age 52.	Ap. 27,'64 Ap. 27,'65	Right; flap; by A. A. Surg. O. D. Norton (gangrene)? Disch'd.
3	Bartlett, A. A., Pt., A, 49th New York.	Se. 17,'62, Jan. 4,'63.	Left; by Surg. O. A. Judson, U. S. V. Pens'd April 6,'63. *Spec.* 635.
4	Branham, J. H., Pt., C, 2d Wisconsin.	Aug. 28. Oct. 1,'62.	Left; flap. Disch'd June 19,'63; pensioned; healthy stump.
5	Brnso, O., Pt., A, 121st New York, age 21.	Ap. 6,'65. April,'66.	Left; by Dr. J. P. Foot (gang.; lig. ulnar). Disc'd Aug 1, 1865.
6	Butts, P. A., Serg't, A, 23d Kentucky, age 22.	May 27, Au. 18,'64	Left; circ.; by Surg. B. B. Breed, U. S. V. Pens'd Jan. 7, 1865.
7	Cambe, S., Pt., A, 40th Indiana, age 33.	De. 31, 62 Jul. 18,'63	Left; by A. A. Surg. H. M. Lilly (excision). Pens'd Nov. 16, 64.
8	Campbell, F., Pt., A, 28th Massachusetts.	June 18, Jul. 20,'64	Left; flap; by A. A. Surg. J. W. Wolverton. Disch'd Jan. 18,'65.
9	Cape, T., Pt., C, 12th Kentucky.	May 29, Oc. 30,'62.	Right; by A. Surg. J. M. Study, U. S. V. Pens'd Feb. 13, 1863.
10	Casey, T., Pt., A, 69th New York, age 32.	June 3, July 11, 1864.	Left; skin flap; by A. A. Surg. S. D. Marshall (hæm.). Disch'd July 24,'65; pens'd. *Spec.* 3613.
11	Cheney, D. J., Pt., A, 2d Massachusetts.	May 2,'63 1869.	Left; by Dr. G. Kimball. *Spec.* 1152.
12	Conant, J. H., Pt., A, 86th Illinois, age 36.	July 4, Oct. 1,'64.	Right; circ.; by A. A. Surg. S. W. Thompson. Disch'd July 2,'65.
13	Courtenay, J. A., Pt., B, 1st Me. H. A., age 29.	May 19, Au. 18,'64	Left; flap. Disch'd July 22,'65; pensioned; stump healed.
14	Crane, H., Pt., I, 155th New York, age 25.	June 15, Jul. 30,'64	Right; flap; by A. A. Surg. H. Craft (hæm.). Pens'd Jan. 21,'65.
15	Crosby, E., Serg't, I, 6th Maine, age 27.	July 3, Aug. 25, 1863.	Left; flap; by Surg. A. B. Mott, U. S. V.; July 8, amp. finger; gangrene. Disch'd Jan. 18,'64.
16	Drake, A. S., Pt., B, 16th Mass., age 25.	May 31, Jul. 1,'62.	Left; circular; by Dr. J. E. Steele (hæm.). Pens'd Oct. 14, 1862.
17	Egan, J., Pt., F, 6th Vermont, age 19.	May 5, June 29, 1864.	Left; flap; by Surg. E. E. Phelps (gangrene; hæmor.). Disch'd Oct. 21,'65; pens'd; healed.
18	Green, G. W., Pt., F, 104th New York.	Sept. 17, Oc. 29,'62.	Left; by A. A. Surg. L. Heard. Disch'd Nov. 14,'62; pensioned.
19	Green, N. H., Pt., D, 6th Michigan Cavalry.	Sept. 14, Nov. 3, 1863.	Left; circular; by Dr. Bartholow. (Sept 15, exc.; gang.); Nov. 17, amp. arm. Pens'd March 24,'64.
20	Green, W., Pt., C, 27th Indiana.	May 2, J'e 6, '63.	Left; circular. Disch'd March 12, 1864; pensioned; sound stump.
21	Guy, J. L., Pt., E, 18th Ohio.	De. 31,'62 Feb. 5,'63.	Left; flap; by Surg. W. P. Johnson, 18th O. Pens'd Mar. 31,'63.
22	Hartigan, E., Pt., C, 3d Delaware, age 25.	Aug. 20. Se. 30,'64.	Left. Discharged June 11, 1865. Not a pensioner.
23	Hersinger, F., Pt., I, 15th N.Y.H.A., age 42	Feb. 6,'65, M'h 13,'65	Right; circ.; hæm. Disch'd June 22,'65; pens'd; stump healed.
24	*Herring, B. D.*, Pt., Madison's Art., age 22.	May 4, J'e 5, '63.	Left; circ. (recurrent hæmorrhage). Furloughed June 30, 1864.
25	Hinds, J. D., Pt., G, 1st D. C. Cav., age 22.	June 25, Au. 28,'64	Left; flap; by A. A. Surg. G. E. Brickett. Pens'd May 19, 1865.
26	Hughes, I. M., Pt., F, 21st Iowa.	May 1, July, '63.	Right; by Surg. A. Hammer, U. S. V. Disch'd Sept. 24,'63; pens'd.
27	Igo, J., Pt., C, 2d New York Heavy Art.	June 11, Jul. 28,'64	Left; flap. Discharged Nov. 14, 1864; pensioned; good stump.
28	Johnson, J. D., Pt., A, 115th Illinois, age 27.	Sept. 20, No. 25,'63	Left; circular; by A. Surg. B. E. Fryer. Pens'd Dec. 10, 1864.
29	Jones, J. T., Serg't, B, 117th New York, age 30.	Jan 15, Feb. 15, 1865.	Right; circular; by A. Surg. J. M. Palmer. Pens'd June 12,'65. Died Jan. 21,'66, chronic diarr.
30	King, W. W., Corp'l, F, 8th Indiana, age 21.	Oct. 19, No. 24,'61.	Left; circ.; by A. A. Surg. J. M. McGrath. Disch'd Mar. 2, 1865.
31	Lewis, E. H., Pt., E, 145th Pa., age 18.	De. 13,'62 Fe. 16,'63.	Left; circular (excis.); hæm.; lig. Disch'd June 13,'63; pensioned.
32	McLain, S., Pt., D, 2d Sharpshooters, age 28.	Sept. 21, Oct 18, 1864.	Left; circ.; by A. A. Surg R. F. Mead (excis. metacar. Sept. 21; gangrene). Disch'd Feb. 11,'65.
33	McKennelly, D., Pt., G, 15th Kentucky.	Sept. 19. Oct. 30, 1863.	Right; flap; by A. Surg. C. S. Frink, U. S. V. (amp. finger Sept. 28; erysip.); hæm.; lig. interes. To V. R. C. Aug. 26,'64; pens'd.
34	Messerve, M., Pt., C, 30th Maine, age 19.	April 23, Au. 27,'64	Left; circular; by Surg. C. Winne (erysip). Pens'd June 3, 1865.
35	Nixon, A. H., Capt., K, 84th Pa., age 31.	June 1, Jul 9,'64.	Left; flap; by Dr. S. Cullen, Camden, N. J. Disch'd; pens'd.
36	Potter, H. H., Corp'l, A, 53d Ohio age 21.	July 22, No. 10,'64	Right; circular; by A. Surg. D. J. Swarts. Pens'd April 7, 1865.
37	Reiley, P., Serg't, F, 96th Pennsylvania.	May 10, J'e 10,'64.	Right; circ.; by Dr. T. R. Crosby. Pens'd April 12,'65; arm. amp.
38	Shafer, J., Pt., I, 127th Pennsylvania, age 36.	Dec. 13, Ja. 16,'63.	Left; circ.; by Dr. J. Stearns, jr. Pens'd April 3,'63. *Spec.* 995.
39	Stitzler, D., Pt., C, 77th Pennsylvania.	Dec. 31, 1862, Mar.,'63	Left; circular; by Surg. T. A. McParlin, U. S. A. (gang.; hæm.). Disch'd April 13,'63; pensioned.
40	Street, D., Pt., B., 69th Pennsylvania, age 30.	June 2, Jul 25,'64	Right; circ.; by Dr. A. S. Uhler. Pens'd Mar. 16,'65. *Spec.* 3673.
41	Taft, D. W., Pt., I, 95th New York, age 20.	Mar. 3. June 5, 1865.	Right; circ.; by A. A. Surg. J. P. Agnew (excis. radius April 12). Pens'd July 22,'65. *Spec.* 4284.
42	Thayer, N. D., Serg't, A, 25th Michigan.	Jan. 23, M'y 14,'63	Left; circular; by A. Surg. W. A. Bradley. Pens'd Aug. 5,'63.
43	Thompson, H. A., Pt., A, 36th Mass., age 20.	May 6, Jul. 2,'64.	Left; ant.-post. flap; by Dr. H. M. Dean. Pens'd Jan. 16, 1865.
44	Tibbits, W. W., Pt., B, 87th Indiana.	Sept. 19, Oc. 29,'63.	Left; flap; by A. Surg. C. F. Haynes. Pens'd May 30, 1864.
45	Wall, C., Pt., H, 81st Pennsylvania.	June 30. Au. 6,'62	Left; flap; by Surg. D. W. Bliss. Disch'd October 6, 1862; pens'd.
46	Wallace, J., Pt., B, 28th Massachusetts.	De. 13,'62, June, 1863.	Left; by Dr. G. W. Gay, Boston; erysipelas. To V. R. C. Disch'd Mar. 2 4, 1869. Not a pensioner.
47	Becker, W., Serg't, B, 98th Pa., age 26.	July 2, Aug. 30, 1862.	Left; flap; by A. A. Surg. R. Livezey; hæm.; ligation. Discharged Aug. 17, 1864; pens'd.
48	Bigelow, W., Corp'l, D, 9th Maine, age 22.	Sept. 29. No. 7,'64.	Right; circ.; by A. A. Surg G. D. Trumpore. Pens'd Feb. 11,'65.
49	Bohn, A., Pt., I, 36th Wisconsin, age 21.	June 3. Jul. 12,'64	Right; flap; by A. A. Surg. W. P. Moon. Pens'd Feb. 11, 1865.
50	Brady, J., Pt., D, 17th Infantry, age 20.	July 2. Au. 4,'63.	Right; flap; by A. A. Surg. W. L. Hays. Discharged; pens'd.
51	Camp, H., Corp'l, A, 113th Illinois, age 20.	May 19, J'e 28,'63.	Left. Discharged September 1, 1863.
52	Cobb, S., Pt., H, 17th Maine.	July 3, Sep. 1,'63.	Right; circ.; by A. A. Surg. C. Phelps. Pens'd Oct. 10, 1863.
53	Conlon, J., Corp'l, I, 136th N. Y., age 21.	July 3, Aug. 15, 1863.	Left; flap; by A. Surg. C. R. Greenleaf, U. S. A. Disch'd June 24, 1865; pens'd. *Spec.* 2551.
54	Courter, H., Corp'l, A, 5th N. J., age 39.	June 23, Aug. 29, 1864.	Right; circ.; by A. A. Surg. W. S. Hendrie (July 22, amp. fing.). Pens'd Mar. 29,'65. *Spec.* 3194.
55	Clark, W. H., Pt., F, 18th Conn., age 25.	J'e 8,'63, Feb. 3,'64.	Left; flap. Discharged May 10, 1864.
56	Crapsey, J., Pt., A, 110th Ohio, age 23.	May 6. June 6, 1864.	Left; circ.; by A. A. Surg. D. P. Wolhaupter. Disch'd April 17, 1865. *Spec.* 2580.
57	Crowley, D., Pt., D, 35th Massachusetts.	Se. 17,'62, Aug.—, 1863.	Left; flap; by A. A. Surg. J. W. Cushing (excision metacarpal). Duty Dec. 28, 1863; pensioned.
58	Crowley, L., Pt., F, 2d N. Y. M. R., age 39.	June 17, Aug. 5, 1864.	Left; circ.; by A. A. Surg. J. F. Wilson (amp. fingers June 18). Disch'd January 11, 1865.
59	David, A., Pt., E, 111th Pennsylvania, age 18.	May 15, Jul. 1,'64.	Right; circ.; by A. Surg. C. W. Lawrence. Pens'd Dec. 26, 1864.
60	Davis, F. M., Pt., A, 51st Indiana, age 22.	April 7, J'e 24,'64.	Right; ant.-post. flap; by A. A. Surg. W. H. Matlock (gang.). Pens'd Oct. 27,'64. *Spec.* 3371.
61	Dehn, J., Corp'l, C, 1st Minnesota.	July 3, Au. 12,'63	Right; by Surg. S. D. Freeman, U. S. V. Dis'd Nov. 19,'63; pen'd.
62	Dickinson, R. J., Pt., B, 127th Illinois.	May 22. Jul. 29,'63	Right; flap; by Surg. A. Hammer, U. S. V. Pens'd Sept. 24, 1863.
63	Eagin, T., Pt., B, 92d New York, age 28.	Aug. 16, Sept. 19, 1864.	Left; circular; by A. A. Surg. T. L. Van Norden (amp. finger August 25). Disch'd Dec. 23,'64.
64	Edgell, W., Corp'l, E, 97th Ohio.	De. 31,'62 Fe. 15,'63	Left; flap. Disch'd April 9, 1863; pensioned; perfectly healed.
65	Edwards, S. M., Serg't, K, 17th Pennsylvania Cavalry, age 44.	June 11, Sept. 17. 1864.	Left; circular; by A. A. Surg. J. Winslow. Disch'd April 4,'65; pensioned. *Spec.* 3255.
66	Eggleston, A. J., Pt., M, 2d Pa. Heavy Art.	Sept. 29, No. 7,'64.	Right; flap. Discharged January 2, 1865.
67	Evarts, G., Pt., D, 1st Vermont.	July 12. Au. 16,'64	Right; flap; A. A. Surg. H. Craft; erysipelas. Pens'd July 24, 65.
68	Ferris, L. H., Corp'l, C, 3d Michigan.	Aug. 31. Oct. 5,'62.	Left; by A. A. Surg. P. H. Brown. Discharged December 6, 1862.
69	Flannigan, E. F., Pt., D, 9th N. H., age 32.	Sept. 30, Nov. 4, 1864.	Left; lateral flap; by A. A. Surg. H. Craft. Disch'd June 1, 1865; pensioned. *Spec.* 3584.
70	Garrett, L. L., Corp'l, F, 8th Kentucky.	Jan. 2, Mar.,'63.	Right; by A. Surg. A. B. Chapin. Disch'd April 1, 1863; pens'd.
71	Gibson, S. O., Corp'l, D, 11th New Hampshire, age 23.	June 17, Dec. 19, 1864.	Right; ant.-post. flap; by A. A. Surg. J. M. Whitaker (exc. rad. June 18). Pens'd June 2, 1865.
72	Gingry, D., Pt., E, 184th Pennsylvania, age 37.	June 10, July 28, 1864.	Left; circular; by A. A. Surg. W. B. Corbit (amp. fingers). Disc'd April 8,'65; pens'd. *Spec.* 3656.
73	Green, W., Pt., C, 35th Massachusetts, age 20.	Sept. 17, Oct 19, 1862.	Right; circular; by A. A. Surg. N. Hickman. Disch'd Jan. 17, 1863; pens'd. *Spec.* 880.
74	Gump, A. J., Pt., C, 61st Pennsylvania, age 27.	May 6, Dec. 20, 1864.	Right; ant.-post. flap; by Surg. N. R. Moseley, U. S. V. Disch'd Mar. 7,'65; pens'd. *Spec.* 3517.
75	Haas, S., Lieut., B, 7th New York.	De. 13,'62 Ja. 13,'63.	Right; by Dr. E. Kruckowizer, N. Y. Disc'd Apr. 2,'63; pens'd.
76	Hall, G. W., Pt., E, 10th Illinois, age 37.	Aug. 22, Oct. 5, 1861.	Right; circ; by A. A. Surg. L. B. Voorhies (amp. hand Aug. 27). Disch'd July 1, 1865; pens'd.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
77	Harlow, F. M., Pt., I, 18th Missouri, age 25.	Aug. 7, Oc.28,'64.	Left; circular; by Surg. J. H. Grove. Discharged.
78	Hazen, W., Pt., B, 57th Pennsylvania.	May 6, Oct. 12, 1864.	Left flap; by A. A. Surg. D. Kennedy. To V. R. C. Jan. 14,'65; pensioned; stump healed
79	Henderson, W., Pt., G, 1st N. J., age 21.	May 3, J'e 14,'63.	Left (haemorrhage). Disch'd Oct. 22,'63; pens'd; stump bad.
80	*Hoxant, G. S.*, Pt., F, 12th S. C., age 19.	May 12, Oct.3,'64.	Right; circular; by A. A. Surg. J. Harris. To prison March 1, '65.
81	Hodges, B., Corp'l, G, 5th Conn., age 21.	July 20, Oct. 30, 1864.	Right; flap exc. ulna July 24); erysipelas; gangrene. Disch'd Feb., 1865; pensioned; sound.
82	Jones, T., Pt., F, 10th Minnesota, age 17.	May 6, June 10, 1864.	Left; by Surg. S. B. Sheard wn and A. Surg. W. W. Clark, 10th Minn. Disch'd July 23, 1864.
83	Jones, W., Pt., I, 1st N. Y. Dragoons, age 25.	May 7, J'e 22,'64.	Left; circular. Discharged July 21, 1865.
84	Kearnes, J. V., Pt., H, 13th Infantry.	May 19, 1863, April,'64.	Right; by Dr. W. S. Boyd, Vinton, Iowa. Disch'd Sept. 17,'63; pensioned; good stump.
85	Krepps, D., Pt., C, 148th Pennsylvania.	July 1, Au.14,'63.	Left; flap. Discharged February 5, 1864.
86	Langdon, S., Pt., I, 3d New York.	Jul.30,'64 April 10, 1865.	Right; flap; by A. A. Surg. T. Bartram (amp. finger July 30). Discharged; pensioned
87	Lahr, J., Pt., F, 6th Infantry.	June 27, Jul.28,'62	Left; by A. A. Surg. W. W. Hays. Pens'd Nov. 25, 1862. *Spec.* 35.
88	Lewis, T., Serg't, E, 5th Michigan, age 26.	July 2, Aug. 26, 1863.	Right (Teal's method); by A. A. Surg. A. Hewson. Disc'd April 20, 1864; pens'd. *Spec.*, 2594.
89	Madert, J., Pt., G, 2d Infantry.	Sept. 17, Oc.2,'62.	Right; by Asst. Surg. B. Knickerbocker. Pens'd March 9, '63.
90	Masters, S., Pt., H, 54th Pennsylvania.	June 17, Jul.19,'64	Left; circ; by Surg. L. R. Stone, U.S.V. Dis'd Dec. 16,'64; pen'd.
91	*Mathews, B. W.*, Serg't, E, 47th North Carolina, age 28.	July 3, Aug. 30, 1863.	Left; ant.-p. st. flap; by A. A. Surg. J. E. Steele (erysip.); amp. arm Oct. 25. To prison April 19,'64.
92	McKiernan, J. H., Pt., K, 6th Iowa.	May 28, Jul. 5,'64.	Left; flap. Discharged November 25, 1864; pensioned.
93	McMillan, A., Pt., A, 7th Michigan.	Sept. 8, Oct. 23, 1862.	Left; circular; by A. Surg. A. M. Clark, U. S. V. Disch'd Dec. 3, 1862. *Spec.* 243.
94	McWaugh, J., Pt., H, 119th Pennsylvania.	May 3,'63 Second'y	Left; circ. To V. R. C. Feb. 25, 1864; pens'd; healthy stump.
95	Mess, P. W., Pt., D, 124th Ohio, age 20.	May 27, Au.17,'64	Right; circ.; by Surg. R. R. Taylor, U. S. V. Pens'd Nov. 18,'64.
96	Moses, G. F., Pt., B, 39th Mass., age 19.	May 10, 1864, Jan.7,'65.	Left; circular; by A. A. Surg. J. Tyson (amp. wrist joint May 10). Pens'd Mar. 19,'65. *Spec.* 4197.
97	Mute, G., Pt., C, 47th New York, age 20.	May 15, Nov. 25, 1864.	Right; flap; by A. A. Surg. J. F. Thompson. Disch'd March 30, 1865; pens'd. *Spec.* 3437.
98	Odell, I., Pt., H, 45th Pennsylvania, age 20.	June 3, Sep.3,'64.	Left; circ.; by Dr. J. T. Lanning (June 3, exc.). Pen'd Jan. 22,'65.
99	Parvis, J. W., Serg't, I, 103th Indiana.	Aug. 31, Oct. 9,'64.	Left; by A. A. Surg. G. E. Stubbs. Pens'd Feb. 12,'65; sound stump.
100	Richmond, R. H., Pt., K, 9th Iowa.	Mar. 6, Au. 12,'65.	Left; circ.; by Dr. J. M. Lanning, Paris, Iowa. Pens'd Jan. 27,'63.
101	Rodgers, J. M., Serg't, D, 122d Ohio, age 27.	May 7, Au. 31,'64	Left; circ.; by A. A. Surg. J. M. McGrath. Pens'd; sound stump.
102	Rose, A. J., Pt., C, 142d Pennsylvania, age 25.	Jul. 1,'63. Au. 16,'63	Right; circ.; by A. A. Surg. T. J. Yarrow. Pens'd Dec. 23, 1863.
103	Shank, L., Pt., H, 54th Pennsylvania, age 41.	July 18, Se. 15,'63	Right; circ.; by A. A. Surg. E. G. Waters. Pens'd Jan. 17, 1865.
104	Smith, D., Pt., H, 124th Illinois.	J'e 26,'63. Ap. 3,'64.	Right; flap; by Dr. P. A. Allaire, Aurora, Ill. Pens'd April 25,'64.
105	Sprague, T. J., Pt., D, 2d Pa. H. A., age 18.	June 15, Au. 3,'64.	Left; circ.; by A. A. Surg. W. Post (gangrene). Pens'd April 8,'65.
106	Sprout, F. M., Pt., B, 23d Missouri.	April 6, M'y 9,'62.	Right. Discharged Dec. 1, 1862; pensioned; stump sound.
107	Thalheimer, J., Pt., B, 63d Pennsylvania.	Jul. 1,'62. Ap. 5,'63.	Left; flap; Drs. Pollock and Shaw, Dis. Sep.22,'62. Died Jan.13,'72.
108	Thompson, D. A. L., Pt., B, 50th Ill., age 24.	Mar. 20, M'y 18,'65	Left; circular; by A. Surg. S. H. Orton. Pensioned Oct. 3, '65.
109	Thompson, W., Pt., D, 2d Kans. C. T., age 18.	April 30, Jul.29,'64	Right; circ.; by A. Surg. E. A. Clark. Pens'd May 23, 1865.
110	Thorn, B., Pt., C., 38th Illinois, age 23.	Sept. 19, Oc.24,'63.	Right; double flaps (erysipelas). Dis'd July 7,'64; stump healed.
111	Vanakin, E., Pt., G, 120th New York.	July 2, Au. 6,'63.	Right; flap; by A. A. Surg. S. R. Skillern. Pens'd March 26,'64.
112	Waddle, J., Pt., D, 7th Illinois Cav., age 20.	Dc. 4,'63. Jul. 3,'64.	Left; circular; by A. A. Surg. S. Leslie. Pens'd August 9, 1864.
113	White, C. L., Pt., G, 29th Massachusetts.	July 1, Aug. 10, 1862.	Left; doub. flaps; A. Surg. C. A. McCall, U. S. A. (excis. radius). Disch'd Aug. 29,'62; pensioned; stump sound. *Spec.* 157.
114	White, J., Pt., B, 16th Massachusetts, age 34.	May 12, J'e 13,'64.	Left; ant.-post. flap; by Dr. H. B. Knowles. Disch'd May 25, 1865.
115	Whitney, W. A., Pt., C, 9th Michigan.	Mar. 17, Ap. 28,'62	Left; flap; by Surg E. Church, 9th Mich. Pens'd June 28,'62.
116	Wilcox, D., Pt., H, 67th Ohio, age 46.	May 7, J'e 27,'64.	Left; circ.; A. Surg. W. Webster (amp. fing.). Disc'd Nov. 21,'64.
117	*Wilson, J.*, Pt., H, 3d Missouri, age 22.	No. 30,'64 Ja. 24,'65.	Right; ant.-post flap; by Dr. R. McNulty. Paroled March 27,'65.
118	Wilson, W., Pt., E, 8th Ohio.	June 8, Nov., '62.	Left; by A. Surg. C. A. McCall, U. S. A. Pens'd Nov. 8, 1862.
119	Baker, J. H., Pt., G, 24th Missouri, age 18.	Oct., '61. May 2,'62	Left. Discharged June 20, 1862; pensioned.
120	Banghart, P., Pt., M, 198th Pennsylvania.	Feb. 6, M'h 12,'65	Right; flap. Discharged June 22, 1865; pensioned.
121	Barton, J. L., Pt., K, 7th Ohio Cavalry, age 23.	Dc. 16,'63 Au. 15,'64	Left; flap; by Surg. L. R. Stone, U. S. V. Pens'd Dec. 16, 1864.
122	Beach, J. S., Corp'l, C, 2d Infantry.	June 27, Au. 6,'62.	Left; flap; by Drs. Gilfillan, Vason, and Dudley, Brooklyn. Pens'd.
123	Burns, W. W., Pt., E, 91st Pennsylvania, age 28.	June 18, Aug. 1, 1864.	Right; circ.; by A. A. Surg. W. H. Corbit (June 18, amp. finger); Sept. 30, amp. arm. Discharged July 31, 1865; pensioned.
124	Butterworth, J., Pt., F, 1st Rhode Island Artillery, age 21.	Dc. 16,'62 Mar. 13, 1863.	Left; flap; by Surg. C. A. Cowgill, (amp. wrist joint Dec. 16). Pens'd Sept., 1863. *Spec.*, 1229.
125	Campbell, O. C., Pt., F, 134th Pennsylvania.	Dc. 13,'62. Mar., '63.	Left; circ. Disch'd April 2,'63; pens'd; stump perfectly healed.
126	Clay, D., Pt., D, 2d Kansas C. T., age 31.	April 5, July 29, 1864.	Right; ant.-post. flap; by A. A. Surg. E. A. Clark. Discharged June 26,'65; elbow unchylosed.
127	Colwell, J., Corp'l, B, 1st W. Va., age 24.	July 25, Oc 19,'64	Left; flap; by A. A. Surg. T. G. Morton. Pens'd June 7, 1865.
128	Crawford, J. B., Serg't, 75th Illinois, age 21.	June 19, July 22, 1864.	Right; by A. A. Surg. H. H. Bishop (wound of thigh); Aug. 7, re-amp. forearm. Pens'd Feb. 12,'65.
129	Essey, E., Pt., B, 97th Pennsylvania, age 22.	May 20, June 27, 1864.	Left; circ.; by A. Surg. W. Webster, U. S. A. (amp. finger; gangrene). Dis'd Apr. 2,'65; pens'd.
130	Farrington, G. E., Pt., C, 124st New York, age 22.	May 10, Aug. 20, 1864	Right; oval skin flap; circular muscles; by A. A. Surg. W. P. Moon. Disch'd Dec. 10, 1864.
131	Foster, J. W., Serg't, C, 20th Kentucky.	July 5, Au.30,'63	Left; flap. Discharged; pens'd; well healed.
132	Gallagher, B., Pt., F, 17th Infantry.	Sept. 17, Dec. 14, 1862.	Left; circular; by Dr. Pollock, of Pittsburgh. Discharged Jan. 27, 1863; pensioned; good stump.
133	Gordon, D., Pt., E, 25th Kentucky.	April 6, Oct. 14, 1862.	Right; circular; by Surg. E. C. Franklin, U. S. V. (erysipelas). Disch'd Nov. 15,'62. *Spec.*, 1771.
134	Grove, J. D., Serg't, G, 184th Pa., age 25.	June 22, July 24, 1864.	Left; ant.-post. flap; by Surg. N. R. Moseley (exc. meta.); gang. Pens'd June 17,'65. *Spec.* 2896.
135	*Kelly, P.*, Pt., H, 6th Louisiana, age 31.	No. 7,'63, Jan.2,'64.	Right; flap; by A. Surg. J. C. McKee. To prison April 11, 1864.
136	Marshall, T., Serg't, F, 2d Mass. Cav., age 37.	Sept. 19, Oc.28,'64.	Left; double flap; by A. A. Surg. B. B. Miles. Pens'd Apr. 10,'65.
137	McCormick, T., Pt., H, 30th Mass., age 46.	Oc.19,'64, Jan 27, 1865.	Right; circ.; by A. A. Surg. F. C. Ropes (amp. carp. and meta. art.; haem.). Dis'd May 11,'65; pen'd.
138	McNamara, P., Pt., A, 2d New York Heavy Artillery, age 36.	June 16, Aug. 11, 1864.	Left; ant.-p. st. flap; by A. A. Surg. W. C. Merrillat (amput'n finger; haem.; fig.). Disch'd March 27, 1865; pensioned. *Spec.* 2450.
139	Milledge, J., Pt., A, 33d Wisconsin.	Dc. 22,'62 June 21, 1864.	Left; by Surg. H. Culbertson, U. S. V. (exc. Jan. and April, 1863). Pens'd Aug. 14,'63. *Spec.* 3033.
140	Montgomery, G., Pt., H, 105th Pa., age 22.	Aug. 15, Sept. 22, 1864.	Left; circular; by A. A. Surg. G. P. Sargent (gang.; haem.). Discharged June 7, 1865; pens'd.
141	Painter, S., Pt., G, 23d New Jersey, age 18.	May 3, Au 5,'63.	Right; flap; by A. A. Surg. E. G. Waters. Pens'd Oct. 17, 1863.
142	Parker, S. L., Pt., C, 1st Maine Cavalry.	May 11, 1864, May,'65.	Left; by Dr. Seavey, of Bangor, Me. (May 20 haemor.). Disch'd February 9, 1865; pensioned.
143	Potter, C., Pt., D, 10th Massachusetts.	July 1, Au. 16,'63.	Right; flap; by A. A. Surg. J. W. Dickie. Disch'd Jan. 17, 1865.
144	Rickerson, C., Pt., H, 23th Massachusetts.	M'y 6,'64, Jan., '70.	Right; by Dr. J. H. Mackie, pension exam'r. Disch'd; pens'd.
145	Ryde, B., Corp'l, D, 59th Massachusetts, age 35.	June 17, Aug. 12, 1864.	Left; circular; by A. A. Surg. W. P. Moon. Pens'd Dec. 14, '64; stump decaying. *Spec* 3620.
146	Sadler, J., Pt., A, 7th New York, age 34.	Aug. 14, Sept. 15, 1864.	Left; lat flap; by A. A. Surg. W. H. Ensign; amp. finger (haem.; necrosis). Disch'd Mar 22, '65. *Spec.* 3279.
147	Smith, J., Pt., I, 8th N. Y. H. A., age 22.	June 12, Jul.20,'64.	Right; circ; by A. A. Surg. J. C. DuBois. Disch'd March 31, '65.
148	Stebbins, P., Pt., H, 122d N. Y., age 43.	July 12, Aug. 19, 1864	Right; circ.; by A. A. Surg. A. P. Fitch (amp. fingers; gang.). Discharged; pensioned
149	Stotzell, A., Pt., M, 15th Pa. Cav., age 24.	July 20, Se. 23,'64.	Left; circ.; by A. Surg. T. A. McGraw, U. S. V. Dis'd Mar. 27,'65.
150	Vaughn, W., Pt., E, 111th Illinois, age 20.	May 14, Jul.18,'64	Left; flap; gangrene; erysipelas. Disch'd Feb. 25,'65; pensioned.
151	Walker, D. H., Pt., I, 2d Pennsylvania Cavalry.	June 7, July 9, 1864.	Left; circ.; by A. A. Surg. W. H. Triplett; bone removed. To V. R. C. Dec. 20,'64; pensioned
152	Webster, C. F., Serg't Major, 5th Me. age 25.	May 12. J'e 24,'64	Right; circular; by A. Surg. J. C. McKee. Disch'd Nov 25, 1864.
153	Byers, L. F., Serg't Maj., 6th Md., age 27.	Oc.19,'64. Se. 26,'73.	Left; by Dr. C. B. Boyle (Oct. 20, excision of radius). Disch'd June 23, 1865; pensioned
154	Dietz, C., Pt., H, 21st Missouri.	Feb., '62. Second y	Left (amp. little finger and thumb). Discharged July 30, 1862.
155	Williams, T., Pt., A, 11th Pa. Reserves.	June 27, Au. 27,'62	Right; by Dr. J. K. Kane. Discharged Nov. 27,'62; pensioned.

§ *Fatal Secondary Amputations in the Forearm.*—The secondary amputations had a mortality of 15.7 per cent.; proportionally greater by 6 per cent. than the primary.

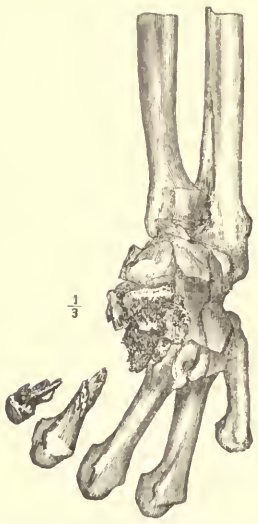

FIG. 716.—Caries after shot fracture of right carpus and metacarpus. *Spec.* 1953.

CASE 1930.—Private D. Johnson, Co. K, 6th Pennsylvania Cavalry, aged 32 years, was wounded in a skirmish at Bristow Station, October 17, 1863. Surgeon J. B. Coover, of the regiment, reported: "Wound of right hand, partially destroying metacarpal bones." Two days after the injury the man was admitted to Lincoln Hospital, Washington. Assistant Surgeon J. C. McKee, U. S. A., reported the following history: "The ball entered at the metacarpo-phalangeal articulation of the little finger, passing through and fracturing the fourth and fifth metacarpal bones, making its exit at the dorsum. On November 1st gangrene first appeared. This was cured, and the parts remained perfectly healthy until November 15th, when gangrene reappeared in the wound. On November 28th tetanus made its appearance; patient very weak, having no appetite and being low in spirits; tetanic spasms easily excited. On December 2d the forearm was amputated, by circular operation, at the junction of the middle and lower thirds, by Assistant Surgeon H. Allen, U. S. A. Sulphuric ether was used. During the operation the patient lost over twenty ounces of blood, producing syncope. Seven ligatures were applied. No tetanic spasms occurred after the operation. The treatment consisted of tonics, stimulants, and nutritious diet, with warm applications to the stump. The patient gradually sank, and died December 13, 1863. Some nerves must have been injured by the ball, but whether that was the cause operating to produce the fatal disease is a question. My opinion is that the primary injury done by the missile was not the cause, but the influence of the gangrene attacking the parts was the excitant of the disease." The specimen, represented in the adjacent cut (FIG. 716), was contributed by the operator. It consists of a ligamentous preparation of the carpus, metacarpus, and lowest thirds of the bones of the forearm. The dorsal surface of the os magnum and unciform are fractured, and the greater portions of the last two metacarpal bones are shattered.

TABLE CXXXVIII.

Summary of Twenty-nine Fatal Secondary Amputations in the Forearm for Shot Injury.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Burnham, L. M., Corp'l, D, 132d Pa., age 22.	Sept. 17, Oct. 28, 1862.	Left; double flap; by A.A.Surg.J. Ashhurst, jr.; hæm.; lig. brach. Died Nov.15,'62,haem. *Spec.*272.	16	Roe, J. M., Pt., E, 12th New Jersey, age 33.	June 4, Jul.23,'64	R't; circ.; Dr. M.C.B. Richardson (June 30, exc. wrist). Died Aug. 7, 1864, pyæmia. *Spec.* 3641.
2	Dickson, W. J., Pt., K, 9th Pa. Reserves.	Sept. 17, No.29,'62	Left (gangrene). Died Dec. 5, 1862, hæmorrhage. *Spec.* 752.	17	*Wiggins, M. W.*, Serg't, F, 30th N. C., age 21.	May 3, J'e3,'63.	Right; circular. Died June 8, 1863, pyæmia.
3	Dougherty, J. W., Pt., H, 89th N. Y., age 22.	June 16, Jul.23,'64	Left; circ.; A.A. Surg. E. C. Bullard. Died Sept.2,'64. empyæ'a	18	Burke, J., Pt., G, 69th Pa., age 44.	June 22, Au. 9,'64.	Right; flap; Surg. N. R. Moseley (gangrene; hæmorrhage). Died Sept. 22, 1864, pneumonia.
4	Eaton, G., Pt., I, 40th Pennsylvania, age 16.	May 12, J'e 13,'64.	Left; circ.; A.Surg.A.Delany (w'd scalp). Died June 15,'64, shock.	19	Childers, J., Pt., I, 34th Illinois.	April 7, M'y10,'62	Left. Died May 23, 1862.
5	Emeley, T., Pt., G, 15th N. Y. Cav., age 22.	April 16, M'y25,'64	Left; double flap; Dr. C. H. Ohr. Died July 12, 1864. *Spec.* 4266.	20	Dixon, R., Pt., H, 82d New York.	Sept. 14, Oc.21,'62.	Left; flap; A. A. Surg. S. Teats. Died Oct. 27, 1862, bronchitis.
6	Guston, A. R., Pt., H, 69th Indiana, age 21.	May 1, J'e 20,'63.	Left. Died June 25, 1863, pyæmia. *Spec.* 1350.	21	McQuade, W., Pt., K, 24th Mass., age 26.	Au.14,'64 March 15, 1865.	Left; by A.A. Surg. W.R. Staveley (amputation fingers Aug. 14). Died May 25,'65, typhoid fever.
7	Hitchcock, A., Pt., E, 20th Connecticut.	May 3, Au. 9,'63.	Left. Died February 29, 1864.	22	Packard, A., Pt., 9th Mass. Battery.	July 2, Au.30,'63	Left; flap; by A. Surg. C. R. Greenleaf (erysipelatous inflammation). Died Sept. 20, 1863, pyæmia. *Spec.* 2598.
8	Peterson, F., Pt., C, 5th New York, age 20.	June 3, Jul.28,'64	Circ.; by A.A Surg. W.P. Moon. Died Aug. 4, 1864, exhaustion.	23	Steinaur, S., Pt., M, 142th Pa., age 18.	April 5, May 24, 1864.	Right; lat. flap; Dr.W. P. Moon; re-amp. forearm July 23. Died Aug. 9,'64, exhaust. *Spec.* 3625.
9	Sanger, G. H., Corp'l, C, 136th N. Y., age 33.	May 15, June 25, 1864.	Right; skin flap, circ sec. musc.; A.A. Surg. J. W. Bligh (hæm.). Died July 1, 1864, cong. fever.	24	Bowman, J., Pt., K, 20th Indiana, age 25.	July 3, Au. 8,'63.	By A. A. Surg. T. G. Morton (gangrene). Died Aug. 9, 1863.
10	Armstrong, B., Pt., D, 151st Pa., age 19.	July 2, Au. 24,'63	Left. Died Sept. 6, 1863, pyæmia. *Specs.* 1796 and 1798.	25	Crawford, C., Pt., D, 1st Ohio, age 20.	May 27, J'e30,'64	Right. Died July 18, 1864, chronic diarrhœa.
11	Arrance, W., Pt., D, 16th Michigan, age 23.	June 1, Jul. 4,'64.	Left; ant. post. flap; by Surg. C. Page. Died July. 10, 1864, gastro-enteritis. *Spec.* 3327.	26	Hillrigal, J., Pt., F, 39th Illinois, age 45.	May 16, J'e 17,'64.	Right; circ.; A. A. Surg. M. Baldwin. Died July 16, 1864, gang.
12	Atkins, J., Pt., I, 30th Illinois, age 35.	May 22, J'e 24,'63.	Right; by A.A. Surg. D. O. Farrand. Died July 1, 1863.	27	Thomas, J., Pt., K, 28th Pa., age 24.	Mar. 6, M'y17,'65	Left; circ.; by A.A. Surg.G.Badger. Died May 27,'65, pyæmia.
13	Grover, J., Pt., D, 79th Illinois.	June 22, July 24, 1864.	Left; circ.; by A. A. Surg. D. A. Grillith (excision radius June 22). Died July 30, 1864.	28	Vandermark, N., Pt., G, 5th N. Y. Cav., age 25.	Mar. 25, 1866.	Right (exc. ulna June 11). Dis'd Nov. 19, 1864; pens'd. Died Nov. 23, 1866, gangrene.
14	Johnson, D., Pt., K, 6th Pa. Cav., age 32.	Oct. 17, Dec.2,'63.	Right; circ. Died Dec. 13, 1863. *Spec.* 1953. See CASE 1930.	29	Washburn, J., Pt., H, 38th Indiana.	Sept. 20, Oc.26,'63	Hæmorrhage; lig. ulnar and rad. Died October 29, 1863, pyæmia.
15	Lewis, C. H., Corp'l, K, 8th Conn., age 30.	Aug. 10, Sept. 15, 1864.	Left; circ.; by A. A. Surg. L. K. Baldwin (hæm'ge). Died Sept. 15, 1864, exhaustion. *Spec.* 3655.				

A summary of the facts regarding the hundred and fifty-five successful and twenty-nine fatal cases of secondary amputation of the forearm is embodied in the foot-note.[1]

[1] The operations were practised on 178 Union and 6 Confederate soldiers: 55 operations with 9 deaths were in the upper third, 80 with 8 deaths in the middle, and 40 with 6 deaths in the lower third. In 9 cases, 6 of which proved fatal, the point of ablation was not recorded. Seventy operations with 10 deaths were on the right side, 111 with 16 deaths on the left, and in 3 fatal cases this point was unspecified. Eighteen, including 1 fatal case, were practised subsequent to excisions in the forearm, wrist, or hand; 3 after disarticulation at the wrist; 14 after partial amputations in the hand. The numerous specimens illustrating this series are specified in the TABLES, and their histories can be consulted in the Descriptive Catalogue of the Surgical Section, 1866, Chaps. VIII and IX.

Amputations in the Forearm of Uncertain Date.—Of the hundred and sixty cases in this category, the results were ascertained in ninety-three; there were ten deaths.

TABLE CXXXIX.

Tabular Statement of One Hundred and Six Cases of Amputation in the Forearm of Uncertain Date.

SEAT OF OPERATION.	TOTAL CASES.	RECOVERIES.	FATAL CASES.	RESULT UNKNOWN.	PERCENTAGE OF FATALITY.
UPPER THIRD	12	10	.....	2	00.0
MIDDLE THIRD	10	8	1	1	11.1
LOWER THIRD	18	16	1	1	5.8
POINT OF ABLATION UNKNOWN.	66	49	8	9	14.0
Aggregates	106	83	10	13	10.7

The names of the patients and a summary of the few recorded facts regarding them appear in the foot-note.[1] This is the last category of the seventeen hundred and forty-seven amputations in the forearm Seven hundred and thirty-four amputations were on the right side, nine hundred and sixty-seven on the left; in forty-six this point was undetermined. The operations were performed on seventeen hundred and thirty-nine patients. Fifteen hundred and sixty-nine cases, of which two hundred and twenty-two were fatal, were of Union soldiers, and one hundred and seventy, of which twenty were fatal, Confederates, the percentage of mortality being slightly less in the latter series.

CONCLUDING OBSERVATIONS ON SHOT WOUNDS OF THE FOREARM.—In reviewing the numerous cases of shot injury of the forearm considered in this Section, it is almost impossible to repress a feeling of amazement at the large amount of operative interference that was deemed requisite in these cases.[2] It is true that about six hundred of the seventeen hundred amputations in the forearm were practised on account of shot fractures at the wrist, yet there remain over a thousand amputations and nearly a thousand excisions performed on account of compound fractures of the bones of the forearm, of which a very small proportion were attended by absolute destruction of the parts by large projectiles or explosions, or by injuries of all the principal blood-vessels or nerves.[3] It has been conclusively shown that many, probably a very large proportion, of the excisions in the continuity, especially of those practised primarily, were inadvisable, augmenting the mortality, and

W.*, Russell, J. H., Silsby, A., Thompson, W. W. These names will enable the student to refer to the cases in the manuscript files of the Surgeon General's Office. The details reported were so meagre that the tabulation of the cases would have been of little service. Eighty-one of the patients were Confederate, and 25 Union soldiers. Thirty-four operations with 5 deaths were on the right side, 61 with 3 deaths on the left; 11 with 2 deaths unrecorded. The fatal results were ascribed either to pyæmia or secondary hæmorrhage. In one of the fatal cases (*Bendall*, 53d Va.) there was a simultaneous amputation of the right leg.

[2] LŒFFLER states (*General-Bericht*, u. s. w., 1867, S. 196) that: "With us, shot fractures of the forearm were long since relegated to the domain of the limb-conserving art, and, in our campaigns, amputation was never performed primarily for injury of the bones alone, although there were many instances of extensive comminution . . . Even injury of the arteries is not an adequate cause for desisting from attempts at conservation."

[3] Dr. H. SCHWARTZ (*Beiträge zur Lehre von den Schusswunden* 1854) remarks that: "In treating shot fractures of the forearm it may be accepted as a rule: that no fractures of the forearm, whether simple or compound, or involving one or both bones, unconditionally demand amputation. The exceptions are: 1, Cases in which cannon balls have already, so to speak, caused partial ablation of the limb; 2, where both bones are comminuted, with laceration of the blood-vessels and nerves; 3, in extensive comminution in the vicinity of joints, with fissures extending into the articulations, so that resection cannot be practised, and nothing can reasonably be expected of conservative treatment."

rarely improving the usefulness of the limbs in those patients who survived. It must also be admitted that a large number of the primary amputations were unnecessary, and, although the resulting mortality was not large when compared with any other returns than those of the British surgeons in the Crimea and the Germans in Schleswig-Holstein, yet it cannot be doubted that in a majority of cases the lives of the patients were placed in greater jeopardy by amputation than if subjected to an expectant conservative treatment. It is noticeable that cases of amputation in the forearm are prominent among the earliest recorded instances of amputation in military surgery, as, for example, those related by Paré, Valleriola, and Bartholinus. Not possessing the tourniquet, and consequently in constant terror of immediate fatal hæmorrhage,[1] the old surgeons preferred to make their ablations at a convenient distance from the trunk. Now, while we have seen (p. 661) that in the War of the Rebellion *excisions* in the upper extremity became comparatively more frequent as the war progressed, the records appear to show that primary *amputations* in the forearm were relatively more numerous in the earlier periods. There were 153 instances, for example, in the year 1862, and only 146 in the year 1863, when the aggregate of shot injuries was thrice greater. It is not uncharitable, therefore, to suppose that inexperienced medical officers, hastily summoned to the field in emergencies, may have then practised such operations as their matured judgments would have condemned.

As to the frequency of amputations in the forearm for shot injury in the Confederate armies, I have been unable to obtain any reliable data. It is probable that the practice was much the same as in the Union armies.[2] The very limited returns that have been published give slightly more favorable results for this operation in the former than in the latter service. An analysis of fourteen hundred and eleven amputations of the forearm for shot injury, returned from European campaigns, gives an average mortality of 49 per cent. This excessive death-rate is principally due to the lamentable fatality that attended

[1] Though the ancients used a constricting band to benumb the limb, a circular ligature to arrest the flow of blood was not used until the latter part of the seventeenth century. DIONIS (*Cours d'opérations de chirurgie*, Paris, 1690, 4 ième éd. 1750, avec notes par LAFAYE, p. 717) states that this instrument, of which he gives a drawing (See FIG. 717), was invented by an army surgeon during the siege of Besançon, in Burgundy, in 1674. LAFAYE adds that the name of this surgeon was MOREL. The first printed reference to the tourniquet is in the rare *Currus triumphalis è Terebintho*, by JAMES YOUNG (or YONGE), of Plymouth, printed at London in 1679. In describing the mode of amputation practised by himself and his friend, LOWDHAM, of Exeter, he dwells upon the "manner of compressing the thigh by ligature, or the arm near the shoulder," whereby "you may detain the descent of the blood, etc." Although the priority of publication is due to YOUNG, and although, as SHARPE (*Critical Enquiry*, etc., 3d ed., 1754, p. 296) remarks, the utility of the tourniquet, like that of many other useful discoveries, seems so obvious, when we once know it, that one would be amazed that it was not thought of by every surgeon accustomed to amputations; and although it may have been discovered independently by YOUNG, yet it seems certain that no one ever used it before MOREL, in 1674. In 1718, the illustrious J. L. PETIT (*Mém. de l'Acad. des Sciences*, 1731) devised the screw tourniquet (FIG. 718), which, variously modified, is still universally used. Any one who will search for actual specified examples of amputations for shot injury prior to the commencement of the XVIII century will be astonished at their extreme rarity. One of the earliest detailed cases of amputation in the forearm for this cause that I have met with is related by BARTHOLINUS (Th.) (*Acta medica et philosophica Hafniensia*, Hafn., 1677, Vol. IV, p. 92, Cap. XXX, Spacelus a bombardae globulo): In 1676 an officer was shot in the left forearm just above the wrist by a leaden ball from a hostile bombard, which fractured both bones of the forearm. Intolerable pain ensued, augmented by cold during a four hours' transport to a neighboring city; pain extended to arm and shoulder blade; the usual means failed to check gangrene; tumor supervened, "sed striis quibusdam livido sanguineis secundum brachii longitudinem ascendentibus." The wound was enlarged, but the hand became sphacelated; on the seventh day amputation was performed, resulting in death on the same evening. The learned Bartholinus seems inclined to ascribe the fatal result to the poisoned metal.

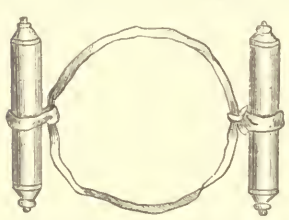

FIG. 717.—MOREL'S tourniquet. [After DIONIS.]

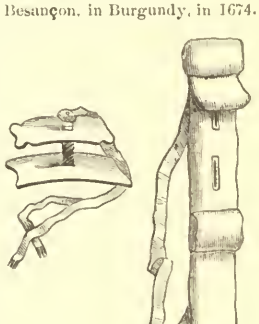

FIG. 718.—Original form of Petit's tourniquet. [From DIONIS, Pl. IV.]

[2] WARREN (E.) (*Epitome of Pract. Surg.*, 1863, p. 396) gives a consolidated report of capital operations performed in and around Richmond, from June 1 to August 1, 1862, in C. S. A. hospitals, which includes: Of amputations in the forearm, 23 primary operations with 2 deaths; 13 intermediary operations with 2 deaths; 9 secondary cases with 2 deaths—or an aggregate of 45 cases of amputation in the forearm with 6 deaths, or 13.3 per cent. CHISOLM (J. J.) (*Man. Mil. Surg.*, Columbia, 1864, p. 361), in a table collated from reports in the Confederate Surgeon General's Office, from June 1, 1862, to February 1, 1864, reports 69 primary amputations in the forearm with 8 deaths, and 45 secondary cases with 10 deaths, a total of 114 cases with 18 deaths, or 15.8 per cent. This statement is identical with one printed in the official statement of Surgeon F. SORRE, Inspector of Hospitals, in *Confed. States Med. and Surg. Jour.*, 1864, Vol. I, p. 153.

surgical operations of almost every description among the Russian troops in the Crimean war, and in the French armies in all of their later campaigns. In the following numerical statement of four thousand and twenty-nine shot fractures in the forearm reported by European surgeons, the results of fourteen hundred and eleven amputations, of one hundred and thirty-three excisions, and of twenty-four hundred and eighty-five cases treated by expectation, are exhibited in striking contrast.

The evidence from our own and from foreign experience appears overwhelming that, except in the rare instances in which the tissues are almost disorganized, shot wounds and fractures of the forearm should be, in Loeffler's phrase, "relegated to the domain of the limb-conserving art."

The flap methods of amputating in the forearm were employed by the Union surgeons somewhat more frequently than circular incisions.[38] Some further observations on shot

[38] Of 1231 cases in which the mode of operation was specified, 667 amputations of the forearm were practised by double or single flaps, by TEALE'S method, or by skin flaps with circular division of the muscles, the plan by double palmar-dorsal flaps made by transfixion preponderating. Five hundred and sixty-four operations were done by circular incisions. The mortality of the flap operations was 10.8, of the circular 11.3 per cent.

wounds,[1] fractures,[2] and amputations[3] in the forearm, and a brief bibliography of the subject[4] are embodied in the foot-notes.

---

[1] NEALE (H. ST. JOHN) (*Chirurgical Institutes*, London, 2d ed., 1805, p. 235) states: "Gunshot wounds of the forearm are more susceptible of bad symptoms than those of the arm. The difference arises from this, that all the muscles situated upon the forearm are conjointly wrapt up in a tendinous membrane, that is, an aponeurosis or expansion, detached from all the flexor and extensor muscles, which membrane, dipping into the interstices of all the muscles of the part, covers each of them likewise in particular. The inflammation of this membrane is therefore greatly to be feared, since in that state it strangles at once all these, and besides it may spread and communicate itself to the arm likewise. When this ensues, we observe the whole forearm swell up in a greater or less degree, and sometimes becomes so hard that a gangrene must speedily succeed if not prevented. Hence the great advantages arising from an early dilatation, so often mentioned in this work. On this account the incisions that are made should penetrate to the bottom and imbridle all the parts, but chiefly the common tendinous membrane, in every direction, especially when the radius or ulna is fractured. These incisions should be backed with all kinds of topical emollients fit for relaxing the skin and common membrane, which is now extremely tense. Should all these endeavors fail, and the swelling continue, accompanied with hardness, and increase so as to threaten a sudden gangrene over the whole part, recourse must be had without delay to the scarifications, of which we have formerly spoken. When the swelling that ensued has not been violent enough to require these scarifications, yet its existence may be sufficient to expose the forearm to some accident or another. And we sometimes meet with abcesses formed in different places; abscesses distinct one from another, and that have no communication with the cavity of the wound, because of the various partitions made by the common membrane in the interstices of the muscles. While the pus is forming here, the wound assumes a bad hue, which continues until the matter is evacuated. These abscesses must be opened as soon as the pus can be perceived to fluctuate under the fingers. The inflammation and swelling sometimes cannot be appeased till it terminates in the dissolution and rotting of the common membrane, which occasions thin spreading suppurations both under the skin and among the interstices of the muscles."

[2] Dr. G. H. B. MACLEOD (*Notes on the Surgery of the War in the Crimea*, 1858, p. 305), in referring to the official reports of the British army in the Crimea in regard to shot fractures of the forearm, makes the sensible criticism, which is of wide application, that the returns "do not tell the whole truth, as there is *no provision made in them for showing double injuries;* and many cases are made to appear as having ended fatally from these . . injuries, which were in truth the result of *a complication of accidents of which this one was chosen for registration.*" This is one of the great inconveniences of the statistical method, which it is difficult to avoid. It is only possible to supply the reader with the materials for eliminating the element of error. In the tabulations in this work it has been sought, as far as practicable, to specify the complications that affected the general result as to fatality. In this connection it is to be observed that in 74 of the 1485 determined cases of shot fractures at the wrist, there were serious shot wounds in other parts of the body; and that in 23 of the 193 fatal cases, the injuries in other regions contributed as much and often more to the fatal result as the injury at the wrist. Thus, 6 fatal cases were complicated by chest wounds, of which 3 were undoubtedly penetrations of the thoracic cavity. In 3 cases there were wounds of the abdomen, supposed to be limited to the parietes. In 1 fatal case a shot fracture of the clavicle resulted in inflammation of the lung. In 4 cases there were shot fractures of the opposite upper extremity; in 9 cases, wounds of the lower extremities, involving, in 2 instances, fractures of the femur.

[3] The views of some of the German surgeons on the treatment and results of shot fractures of the forearm in the late Franco-German campaigns will be read with interest: BECK (B.) (*Chir. der Schussverletzungen*, 1872, S. 664) remarks of shot fractures of the bones of the forearm [in the Bavarian Army Corps]: "Of the cases treated on the expectant plan, 53 in number, 5 or 9.4 per cent. died. Consecutive bleeding sometimes required ligation of the vessels, or digital compression, and even the amputation of the limb; lesions of the nerves often caused great impairment of the functions, and atrophy of the muscular tissues. The loss of substance was in some cases considerable, causing deformity, and great displacement of the osseous fragments was often noticeable." FISCHER (H.) (*Kriegschir. Erf. Erlangen*, 1872, S. 145) records 24 shot fractures of the bones of the forearm [treated before Metz]: "Both bones were fractured in 17 cases, the radius alone in 5 cases, the ulna alone in 2 instances. Three of the wounded men died, or 12.5 per cent." Dr. H. FISCHER observes (p. 146): "The treatment of these injuries was simple. When no considerable deformity existed, we used simple splints and bandages. If there was great tendency to displacement of fragments, we preferred gypsum bandages and a position of the limb midway between pronation and supination, with a slightly bent elbow. We never used the local baths that have been recommended." Dr. G. FISCHER, of the Hannoverian quota of the Prussian army, observes (*Dorf Floing und Schloss Versailles*, in *Deutsche Zeitschr. für Chir.*, 1872, B. I, S. 218): "In comminuted fractures of the bones of the forearm erysipelas and phlegmon are not rare; so that splinters should always be early removed, and the arm laid high. Drainage was employed with great advantage, especially when the wounds of entrance and exit were on the palmar side. Persistent suppuration in a wound sinus nine inches long ceased in two days after drainage was employed." Dr. A. SOCIN, a Swiss professor, in charge of a hospital at Carlsrühe, remarks (*Kriegschir. Erf.*, Leipzig, 1872, p. 125): "In the conservative treatment of shot fractures of both bones of forearm, gypsum bandages applied with exactness are necessary on account of the strong tendency to displacement. In cases of fractures of one bone only, the most simple supporting apparatus, a wire splint or Bell's trough, will answer." Professor THEODOR BILLROTH (*Chir. Briefe aus den Kriegs-Lazarethen*, u. s. w., Berlin, 1872, S. 226) dismisses these accidents with brevity. Regarding the injuries of the forearm and hand, he remarks: "So little difference of opinion exists as to their prognosis and treatment, that I will gladly dispense with their further consideration." GORDON (C. A.) (*Lessons on Hygiene and Surgery from the Franco-Prussian War*, London, 1873, p. 147), remarking that "the available statistics are decidedly meagre," relates what he learned in his surgical mission regarding the treatment of shot injuries of the forearm by the French military surgeons. He notes 31 cases from the hospitals at Pöing, Bazeilles, and some of the ambulance stations at Paris, in which conservative treatment was adopted. There were 3 deaths among 26 determined cases. For the most part the limbs were supported by wire-trough splints, and irrigation employed for some days, after which a plaster apparatus was applied. Loose fragments were extracted in all cases. Horrible lacerations from grapeshot in some instances did not interdict attempts at conservation.

[4] Apart from the short references in systematic works on Surgery, comparatively little has been written on amputations in the forearm. Indeed, the lamented VON PITHA (*Krankheiten der Extremitäten*, Erlangen, 1868, S. 106), who most sedulously reported the special bibliography of the subjects of which he treated, mentions, under *Amputation des Vorderarms*, only LINHART and GÜNTHER. The literature of the subject has been to some extent adverted to in preceding notes. The following references may be added: MANGETUS (J. J.) (*Bibliotheca Chirurgica*, Genevæ, 1721, Lib. VI, p. 190) gives, from BARTHOLINUS, a case of amputation in the forearm for gangrene following shot injury, which must have been soon after 1674, the year that MOREL'S tourniquet came into use. CHEZE, surgeon major of the Berwick-regiment, while on duty on the *Lerrette*, a French corvette, furnished an "*Observation sur l'amputation de l'avant-bras à la suite d'une plaie d'arme à feu*, in *Jour. de Méd. Mil.*, Paris, 1783, T. II, p. 102. FREDERIC RUYSCH, (*Responsio ad* M. REVERHORST, *Super nova artuum decurtandorum methodo* [in MANGETUS, *l. c.*, T. II, p. 264]) defends the propriety of an amputation near the wrist for the removal of a hand invaded by large enchondromata, instead of amputating at the upper third of the forearm, as commended by PETER VERDUIN, WILHELM of VLEUTEN, and others. LARREY (*Clin. Chir.*, 1829, T. III, *de l'amputation de l'avant-bras*, p. 603) advises that the surgeon should always regard the centre of the fleshy part of the forearm as the place of election, however near the wrist the injury may be. CONRAD (J. M. LANGENBECK'S *Nosol. und Terap. der Chirurg. Krankheiten*, Göttingen, 1830, B. IV, S. 323) treats fully of *Amputationen des Vorderarms*, VELPEAU (A. L. M.), *Amputation des deux avant-bras*, in *Arch. gen. de Méd.*, Paris, 1827, T. XIII, p. 203. CLOQUET (J.), Art. *Avant-Bras Oper. Chirurg.*, in *Dict. de Méd.* en XXX, 1833, T. IV, p. 417. BAUDENS (M. L.), *Amputation de l'avant-bras*, in *Clin. des plaies d'Armes à feu*, 1836, p. 564. DOHLHOFF, *Amputatio antebrachii*, in *Deutsche Klinik*, 1852, B. II, p. 36. MACLEOD (G. H. B.), *Notes on the Surgery of the War in the Crimea*, 1850, p. 305. DEBOUS, *Amputation de l'avant-bras droit pratiquée par* M. le Dr. SONRIER, *au moyen d'un rasoir et d'une petite scie de menuisier*, in *Rec. de mém de méd. de chir.*, etc., Paris, 1862, T. VIII, 3e sér., p. 456. HEWETT (P.), *Excellent stumps of the forearm in amputation by means of muscular flaps and circular incisions through the skin*, in *The Lancet*, 1862, N. S., Vol. I, p. 277. LEGOUEST (L.) (*Chirurgie d'Armée*, 1863, p. 689 *et* p. 722) approves attempts at conservation even when the bones are comminuted with laceration of the arteries, and disagrees with LARREY as to amputating high up, when the injury is near the wrist, to avoid inflammation of the tendinous sheaths. See also WILLIAMSON (J.), *Mil. Surg.*, 1863, p. 131. DEMARQUAY (J. M.), Art. *Avant-Bras*, in *Nour. Dict. de Méd. de Chir. Prat.*, 1866, T. IV, pp. 225–301. GIRARD (M.), *Amp. de l'avant-bras*, in *Le Bordeaux Méd.*, 1872, T. I, p. 294.

Section VII.

WOUNDS AND OPERATIONS AT THE WRIST.

We shall consider in this Section only shot injuries of the wrist,[1] and the excisions and amputations practised at this joint for direct lesions from shot, or for the effects of wounds of the metacarpus or phalanges. Examples of punctured or incised wounds by war-weapons are not found on the returns. Frightful laceration of the wrist joint by shell fragments or by large projectiles, or by explosions, are sometimes observed. More frequently musket balls or other small missiles shatter the lower extremities of the radius or ulna and open the wrist joint, or the first or second range of carpal bones are injured by the direct or oblique passage of balls. In the first class of cases, immediate amputation is required. In the second, the indications are less simple. The joint is so surrounded by dense ligaments with layers of superimposed tendons, the whole bound down by the annular ligament, that the resistance to the inflammatory swelling is intense, and the reaction is attended by excessive pain, and, unless tension is promptly relieved, the extension of suppuration is great, involving not only the complicated articular surfaces, but the cancellous structure of the bones. Great risk of pyæmic infection then arises, and operative interference becomes necessary, at least to the extent of free incisions into the joint, and extraction of all detached splinters. How far it may be advisable to attempt to avert these dangers by primary resection is a question yet undetermined, on which the surgical record of the war throws some light. Experience as well as consideration of the anatomical relations of the part (Fig. 719) indicates that the penetration of missiles in the dorso-palmar diameter is less harmful than transverse or oblique shot perforations.[3] Of the various forms of this injury the most numerous were probably those in which balls shattered the lower ends of the radius and ulna and opened the wrist joint; but lodgements of balls in the carpus, perforations of the joint in all directions, and wounds from missiles entering the dorsal or palmar surfaces of the hand, fracturing the matacarpus or passing obliquely upward into or through the carpal bones, were not infrequent. Attention will be confined to shot fractures involving the wrist.[4] The layers of soft parts covering the joint are so thin that few shot wounds in this region amounting to more than skin-scratches fail to implicate the bones. It is not improbable that there may have been examples of periarticular flesh wounds followed by secondary involvement of the joint, but no definite description of such lesions have been observed on the returns.

[2] Sappey (Ph. C.), *Traité d'Anatomie Descriptive*, deuxième éd., 1867. T. I, p. 384.

[3] Legouést (L.) (*Chir. d'Armée*, 2ème ed., 1872, p. 530) teaches that "Shot fractures of the wrist, when the region traversed in its long diameter is the seat of much shattering (*délabrements*), require amputation in the forearm. When the joint is perforated from before backward, without great disorders, by extracting splinters the limb may be preserved."

[4] Ravaton (*Chirurgie d'Armée*, 1758, p. 311) has some instructive observations on shot wounds of the wrist: "The numerous small bones forming the carpus," he says, "are united by such a multitude of articulations, and bound together by such an infinitude of ligaments, tendons, and strong membranes, that fractures of this part induce symptoms that must oppose the most obstinate resistance to the best-conceived methods of dressing; besides which there is other constant fear of ulterior caries, etc. These shot fractures are more or less grave in proportion to the extent of the lesions of the tendinous parts, the vehement febrile reaction which often presents itself, the good or bad constitutional condition of the subject, and his youth or age. Whether the ball enters on the dorsal or palmar surface, its exit wound will always be found larger than the entrance orifice, and near the former point splinters will always be found collected. At the exit wound, then, is the place to extract them—gently, not tearing or dragging away the fragments, but delicately dividing with the scissors the bits of tissue that retain them. . . . ."

Of the large number of cases reported, more than a third were treated by amputation, and these have been enumerated in the preceding tabular statements. The comparatively novel expedient of excision was sometimes resorted to, while the large majority of cases were treated by expectant conservative measures, with a comparatively low rate of mortality. The cases are classified in the following table:

TABLE CXLI.

Descriptive Numerical Statement of the Treatment of Fourteen Hundred and Ninety-six Shot Fractures of the Bones of the Wrist.

MODE OF TREATMENT.	CASES.	DUTY.	DISCHARGED.	DIED.	RESULT UNDETERMINED.	MORTALITY OF DETERMINED CASES.
Treated by Expectation	716	254	399	54	9	7.6

	1,496	330	962	193	11	12.9

We shall examine briefly some of the cases treated by expectation, and those treated by excision more in detail, since the information published on the subject is comparatively limited. The operations of disarticulation at the wrist will be enumerated; the amputations in the forearm for wrist injuries have already been adduced.

SHOT FRACTURES OF THE WRIST TREATED BY EXPECTATION.—Shot wounds of the wrist are generally attended with fracture;[1] but unless the destruction of parts is great, a conservative treatment of these injuries has been recommended by the majority of military surgeons from Paré down.[2] Mr. Cole is one of the few who dissent from this rule of practice.[3] In seven hundred and seven determined cases treated throughout on the expectant plan, there were fifty-four deaths, or 7.6 per cent., a mortality greater than that of shot fractures in the continuity of the forearm; but considerably less than the death-rate in amputation in the forearm or at the wrist. It should not be forgotten,

[1] Surgeon H. ST. JOHN NEALE, esq. (*Chirurgical Institute, drawn from Practice on the Knowledge and Treatment of Gunshot Wounds*, 2d ed., 1805, p. 243), observes: "Gunshot wounds of the wrist are generally accompanied with a fracture; I mean, that some one, or even a number of its small bones are curtailed, ground down, or shot away; and this can never happen but when the connecting ligaments and aponeuroses of these bones must be greatly injured, and the tendons that pass over this part broken or much lacerated. With regard to the wound of the tendons, this injury may occasion such accidents as we shall treat of when we come to our remarks on wounds of the metacarpus or hand. The inflammation may be kept from spreading over the ligaments and capsula of the joint betwixt the wrist and forearm, the dissolution and rotting of the injured tendinous parts may be prevented, by the incisions and counter-openings, the regimen, the bleedings, and topical applications, and the Peruvian bark, which we have before recommended. When these things are judiciously observed, we have often seen the wounds of this part heal up with great ease."

[2] PARÉ (*Œuvres complètes*, éd. MALGAIGNE, Liv. VIII, Cap. XLII): "Lors qu'il y a playe au carpe . . les doigts se doivent tenir demiflechis, etc." BOUCHER, in his celebrated paper on amputations (*Mém. de l'Acad. de Chir.*, 1753, 4to, T. II. p. 298), gives, as his seventh example of preservation of limbs after shot fracture, the case of a captain of the Orleans grenadiers, whose right wrist was wounded by a musket ball at the siege of Ypres, the missile striking the lower end of the radius and entering the wrist, tearing up the ligaments and tendons. With poultices and fomentations of warm wine and brandy, and many blood-lettings, grave accidents were hindered, yet intense pain persisted, and suppuration brought away many necrosed splinters. In eleven months, the wound was cicatrized, and the motions of the wrist became more free, as BOUCHER was able to infer, "par quelques lettres écrites de cette main."

[3] COLE (J. J.) (*Military Surgery or Experience of Field Practice in India*, 1852, p. 155) observes: "I have never seen a reparable gunshot wound of the wrist joint,—I mean where the bullet has passed into or through the articulation."

however, that numerous cases treated at the outset by expectation, in which excision or amputation were eventually resorted to, with an excessive ratio of mortality, were excluded from this series, and consequently the results of the conservative expectant plan are represented in a too favorable light.

More or less complete anchylosis ensued in the vast majority of cases treated by expectation, and in very many instances the mobility of the fingers was much impaired:[1]

CASE 1931.—Private D. Smith, Co. I, 11th Pennsylvania, aged 26 years, was wounded at Bull Run, August 30, 1862, and admitted to Ryland Chapel Hospital, Washington, two days afterward. Surgeon J. A. Lidell, U. S. V., reported as follows: "Gunshot wound of left wrist, treated without amputation or excision. The ball passed completely through the middle of the wrist, at the juncture of the carpus with the metacarpus. A great deal of inflammation followed, involving the forearm and even the arm. No large pieces of bone have been discharged, but a considerable quantity of grit and small pieces of bone with a great deal of matter flowed away. It was necessary to make incisions in the hand several times. The patient was admitted to Stanton Hospital, from Ryland Chapel, December 5th. The wounds are now healed, and there is a prospect of recovery with a useful hand. This soldier was discharged January 7, 1863," and pensioned. Examiner J. I. McCormick, of Irwin Station, Pennsylvania, May 19, 1865, certified: "A ball entered the middle of the carpus on the dorsum of the hand, and, inclining toward the thumb, emerged through the adductor pollicis muscle. The carpal and metacarpal bones are much injured. The wrist is completely anchylosed, and the fingers and thumb are permanently extended, except that the index finger at the metacarpo-phalangal joint is movable, and can be brought in contact with the thumb, though without power. The little finger is abducted and slightly flexed, but firmly fixed like the rest. No power of prehension remains to him. For purposes of manual labor his injury is almost equal to the loss of his arm or hand." The pensioner was paid September 4, 1875.

Injury of one of the larger arteries complicating these fractures was not always regarded as an absolute counterindication of expectant conservative treatment:

CASE 1932.—Private P. Fallon, Co. I, 146th New York, aged 22 years, was wounded at Fredericksburg, December 13, 1862, and admitted to Point Lookout Hospital three days afterward. Assistant Surgeon C. Wagner, U. S. A., reported: "Gunshot wound of left wrist joint. Hæmorrhage from the ulnar artery, to the amount of sixteen ounces, occurred on December 24th. The ulnar artery was ligated in the continuity. No recurrence of hæmorrhage followed." The man was discharged from service April 23, 1863, and pensioned. Examiner S. O. Scudder, of Rome, New York, June 3, 1863, certified: "A minié ball struck obliquely the dorsal portion of the fourth metacarpal bone of the left hand and came out three inches above the wrist joint. There is slight motion of thumb and forefinger; other fingers useless. Joint stiffened." Drs. A. Churchill and C. B. Coventry, of the Utica Board, certified, December 6, 1871: "The ball lacerated the ulnar artery, which was ligated. From injury to the tendons and muscles the fingers are drawn into the palm of the hand, rendering the hand almost useless," &c. This pensioner was paid December 4, 1875.

Confined abscesses occupying the numerous sheaths, bursæ, and synovial sacs, and leading to extensive adhesions and contractions, were the most frequent complications:[2]

CASE 1933.—Captain T. W. Pate, Co. C, 37th Indiana, aged 49 years, was wounded at Stone River, December 31, 1862. He was admitted to the field hospital of the 2d Division, Fourteenth Corps, where Surgeon F. H. Gross noted: "Gunshot wound." Acting Assistant Surgeon J. A. Murphy, in charge of Third Street Hospital, Cincinnati, reported as follows: "A conical ball entered the left wrist joint on the dorsal side, just below the lower end of the ulna, and, passing through the joint, lodged on the palmar face just external to the insertion of the flexor carpi ulnaris, from which point it was extracted, on the field. Captain Pate obtained a leave of absence and came home. On January 29, 1863, he applied to me at this hospital for advice, when an abscess in the palm of the hand was opened, from which a large quantity of pus escaped. The entire hand and wrist joint was in a high state of inflammatory action. His general health was good; no diarrhœa, or loss of appetite, or fever. Poultices and cold-water dressings were applied until the inflammation ceased and the wound healed. April 1st, wound entirely healed. The power of flexing and extending the wrist or the forearm is somewhat limited. The ability to flex the fingers and extend them has, in a considerable degree, returned. The sensation of the hand is perfect. He returns to duty this day." Captain Pate resigned his commission April 13, 1863. He is not a pensioner.

To moderate inflammation by cold applications—by ice dressings when available,—to support the parts without constricting bandaging upon a padded splint,—to relieve inflammatory tension by free incisions as soon as suppuration took place,—to remove all

[1] HAMILTON (F. H.) (*A Treatise on Military Surgery and Hygiene*, 1865, p. 395) remarks: "Anchylosis is even more certain to ensue upon gunshot injuries of the wrist than of the elbow joint, a result which is due, in the case of the wrist, quite as much to the inflammation which invades the numerous tendons, obliterating their synovial surfaces and binding them together in one common mass, as to the direct injury done to the joint. The limb must not, therefore, be confined by splints or bandages, but, being made to repose upon a soft and well-fitted support, all proper means should be employed to prevent inflammation, and, at the earliest practicable period, the joint should be subjected to gentle passive motion. During the whole of the treatment the fingers should be left at liberty, and they should be occasionally flexed and extended, or they will become anchylosed also."

[2] BAUDENS (L.) (*Plaies d'Armes à Feu*, 1836) gives two examples of conservation of the hand after shot perforation of the wrist: "In the case of Corporal F——, 59th Infantry, the right radio-carpal articulation was traversed by a ball October 11, 1833, the end of the radius being demolished. Fragments were extracted, and recovery with complete anchylosis ensued. A sergeant of Sappers had his wrist perforated by a ball which crushed through the trapezius, trapezoid, and magnum. Numerous small abscesses retarded recovery, but, eventually, the patient had tolerable use of his hand." A multitude of analogous facts, BAUDENS adds, decided me to have recourse very rarely to amputation.

splinters and detached fragments,—and, finally, to institute passive movements of the fingers and hand at the earliest practicable moment,—were the practical indications that were chiefly insisted on in the expectant conservative treatment of shot fractures at the wrist. Ahl's felt forearm splints were sometimes used, but it was more common to lay the limb upon an improvised modification of Bond's splint for simple fracture of the distal end of the radius, bandaging lightly, avoiding all compression. It was seldom that recovery was unattended with considerable deformity:[1]

CASE 1934.—Private W. H. Allen, Co. K, 95th New York, aged 20 years, was accidentally wounded at Slaughter Mountain, May 1, 1864, and admitted to Carver Hospital three days afterward. Act. Ass't Surg. P. C. Gilbert reports: "I found the patient suffering great pain from a wound by a minié ball, which entered upon the palmar side of the left wrist, at the articulation of the radius and ulna with the carpus; exit at the metacarpal-phalangeal articulation, carrying away the first two fingers. All the bones of the carpus were badly fractured except the trapezium, pisiform, and cuneiform; the unciform was slightly injured. Amputation was recommended. At 2 o'clock P. M., the patient having been ætherized, it was deemed expedient to attempt to save the hand. A large number of pieces of bone were removed and the wound was left to heal by granulation." On May 17th, Act. Ass't Surgeon D. C. Marsh "found the patient suffering. Ordered anodyne and an aperient, and ice-water dressings. May 18th, there was an accumulation of pus under the integument and superficial fascia." On June 16th, the man was transferred to De Camp Hospital, and subsequently to St. Mary's, Detroit. Act. Ass't Surg. A. Backus reported his discharge February 25, 1865, because of "anchylosis of left wrist, and loss of first and second fingers with their metacarpal bones." Examiner C. C. Bates, of Potsdam, March 26, 1869, certified: "The thumb at its last and the remaining fingers at their first phalangeal joints are semi-flexed. All the joints of the hand are nearly immovable. The wrist is perfectly immovable. The flexor muscles were nearly all cut off, and are contracted. The cicatrix on front of carpus is very tender. The hand is useless, except that the two fingers are a very poor hook. The limb would be more useful if the hand was amputated. The fingers catch, and are hurt by pushing them under a substance to be lifted. The hand is little else than a weak, tender, clumsy, unsightly end or stump, always suffering in cold weather." The pensioner was paid December 4, 1875.

Pyæmia was frequent in the fifty-four fatal cases treated by expectation:[2]

CASE 1935.—Private B. Larrick, Co. H, 116th Ohio, aged 21 years, was wounded at Berryville, September 3, 1864, and admitted to hospital at Sandy Hook on the following day. Acting Assistant Surgeon N. F. Graham reported: "Gunshot wound of right hand. Patient transferred to Frederick." Acting Assistant Surgeon E. R. Ould contributed the specimen (*Cat. Surg. Sect.*, 1866, *p.* 198, *Spec.* 3846) with the following history: "The patient was wounded by a minié ball entering a little above the centre of the first phalanx of the middle finger, right hand, passing to the inner side of the bone and joint, wounding neither of these structures, but fracturing the metacarpal bone of the middle finger at its centre, also the os magnum and scaphoid. The missile lodged at the head of the metacarpal bones of the middle and index fingers. His previous condition was good. He was admitted to the General Hospital at Frederick on September 6th. The day he entered the hospital, the hand and arm were enormously swollen. The fracture was not detected until the swelling subsided and pyæmia supervened. The wound was probed, but no entrance could be effected. Solution of lead and opium was applied, and anodynes given at night. September 8th, the wound was again probed, with the same result as before. No diminution in the amount of swelling. Free incisions were made which eliminated pus freely. Applied poultices and ordered tonics and stimulants. 11th, arm and hand comparatively less swollen. Inflammation extending up the thecæ of the tendons. No crepitation felt. Treatment continued. 15th, parts still greatly swollen and very painful; suppurating freely. 20th, the patient has apparently improved up to this date, but the swelling has subsided but little. 28th, has a chill, sweat, and a cadaverous countenance. Pulse 103 and weak. Pyæmia evident. October 1st, swelling greatly subsided; crepitation felt, and the fracture detected. 2d, has had chills frequently, and is in a dying condition. At the *post-mortem* examination the cartilages of the wrist joint were found ulcerated, and there were pyæmic abscesses in both lungs." The specimen shows caries of the carpals, ends of metacarpals, radius, and ulna.

The ulterior usefulness of the hand and fingers was greatly dependant upon the after-treatment; and, as the patients with this form of injury were not classed among the very

[1] The later European campaigns afford many instances of the conservative treatment of shot fractures of the wrist. Thus: Dr. L. STROMEYER (*Maximen*, S. 756) tabulates 2, 1 fatal; M. CHENU (*Camp. d'Orient*, p. 328) 64 cases, 5 fatal, and *Camp. d'Italie*, T. II, p. 637, 74 cases, 9 fatal; DEMME (*Studien*, B. II, S. 241) tabulates 79 Austrian cases, 11 fatal; LOEFFLER (*General-Bericht*, S. 218) records 9 cases from the Danish war, 3 fatal; BERENGER-FERAUD (*Etudes sur les blessures du poignet*, etc., in *Bull. gén. de therap.*, T. LXXXII, p. 302) details 6 cases, 2 treated by immediate amputation with 1 death, 4 conservatively at the outset with 1 recovery, and 3 fatal secondary amputations; COUSIN (*L'Union méd.*, 1872, T. XIII, p. 147) reports 3 recoveries in shot fractures at the wrist treated conservatively; BECK (*Schussverletz.*, 1872, S. 592) reports 25 recoveries with anchylosis after shot fractures of the wrist conservatively treated; SÉDILLOT (*Arch. gén. de méd.*, 1871, T. XVII, p. 418) reports 7 shot fractures of the wrist, 4 conservatively treated with 3 deaths, 3 successfully by primary amputation in the forearm; PONCET (*Montpellier Méd.*, 1872) records 3 recoveries under conservative treatment of shot fractures of the wrist; LÜCKE (*Kriegschir. Fragen.*, 1871, S. 33) records 4 shot fractures of the wrist, 3 recoveries with conservation, 1 death with deferred amputation; SCHINZINGER (*Lazareth Schwetzingen*, 1873, S. 65) records 2 recoveries after shot fracture at the wrist, 1 treated by amputation, 1 by conservation; H. FISCHER (*Kriegschir. Erf.*, 1872, S. 156) records 8 recoveries from shot fractures of the carpus, 7 treated conservatively, and 1 by conservation; KIRCHNER (C.) (*Ärztl. Bericht.*, 1872, S. 50) details 12 cases of shot fractures of the wrist conservatively treated, with 2 deaths.

[2] In seventeen cases, beside the one detailed, the fatal event was ascribed to pyæmia. One of these cases, that of Pt. J. McLaughlin, Co. B, 5th Wisconsin, is illustrated by *Spec.* 1337, A. M. M., showing caries following a transverse shot perforation of the left carpus, with fracture of nearly every bone. Four patients succumbed from tetanus. In 1 (*Spec.* 543, *Surg. Sect.*, A. M. M.) a round ball was found embedded in the left radio-carpal articulation. Secondary hæmorrhage was fatal in one case, gangrene in 3, and phlegmonous erysipelas in 6 cases. *Specs.* 543, 1337, 1617, 2916, 3815, 3838, 3846, *Surg. Sect.*, A. M. M., illustrate shot fractures at the wrist in cases treated by expectation.

grave cases, they were frequently removed from one base hospital to another, and rarely received that minute and persevering attention to position, passive motion, and other precautions essential in order to obtain the best possible results.

EXCISIONS AT THE WRIST FOR SHOT INJURY.—Ninety-six such operations were returned, and are distributed into subdivisions, according to the part excised. Six cases are described as total excisions, or extirpations of both rows of carpals with resection of the distal ends of the radius and ulna.[1] Ninety partial excisions consisted in the removal in whole or part of one or more of the bones entering into the carpal articulation. Fifteen cases, or 15.6 per cent., resulted in death, a higher mortality-rate than was observed in amputations in the forearm for shot injury in general, but not much greater than the death-rate in amputations in the forearm *on account of shot fractures at the wrist*.[2] Recourse to consecutive amputation in the forearm was had in eight cases, and in the upper arm in five. Sixty excisions with ten deaths were at the left wrist, thirty-four with three deaths at the right; two remaining cases, in which the side interested was not recorded, were fatal. Nine of the operations were practised on Confederate, and eighty-seven on Union soldiers. The nature and extent of the operations, and the period after injury at which they were performed, are set forth in the succeeding tabular statement:

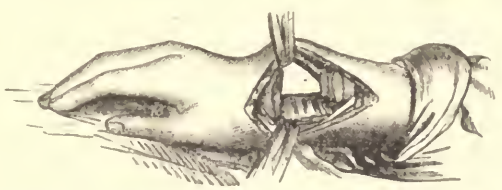

FIG. 720.—Complete excision of right wrist through lateral radial and ulnar incisions. [After BOUISGERY.]

Partly because of the diversity in extent of the operations classified under this head, and partly on account of the rarity of reports of excisions at the wrist for injury, instead

[1] Dr. RICHARD M. HODGES, in his excellent monograph, *The Excision of Joints*, 1861, p. 77, has well defined what is commonly understood by excisions at the wrist: "Under the term 'excision of the wrist, or radio-carpal joint,' must be included not only the removal of what strictly constitutes that articulation (radius and first row of carpal bones), but all operations which excise a part or the whole of the ends of the radius and ulna, a part or the whole carpus, the proximal ends of the metacarpal bones, or all of these at once."

[2] The mean fatality of 1734 determined cases of amputations in the forearm for the effects of shot injury was found (TABLE CXXXII, p. 967) to be 13.9 per cent. In 610 cases, in which amputations were performed in the forearm on account of the effect of shot fractures involving the wrist joint, there were 95 deaths, or 15.5 per cent.

of tabulating the cases of this category, brief abstracts of each will be presented. It is to be regretted that scarcely any special or circumstantial reports were made; but from the returns of different hospitals and of the pension examiners, some details have been gleaned regarding most of the cases. The abstracts are arranged in the order indicated in the descriptive numerical statement on the preceding page:

FIG. 721.—LISTER'S cork splint for excision at the wrist.

FIG. 722.—The cork splint applied. [After LISTER.]

CASES 1936–1941.—The six cases reported as complete excisions at the wrist included one primary operation, three intermediary, of which one resulted fatally, and two secondary operations. All were performed for immediate or remote lesions resulting from fractures or perforations of the carpus by musket balls: 1. Pt. *Speer*, Co. C, 53d Georgia, received, at the Wilderness, May 6, 1864, a shot fracture of the carpus and end of radius. An "excision of the entire wrist joint, including about half an inch of the radius and ulna," was performed the same day[1] by Surgeon J. J. Knott, P. A. C. S., through lateral incisions parallel with the radial and ulnar borders. On November 21, 1868, this man was "able to perform as much manual labor at his occupation of farming as before the reception of the wound, although there was some abduction of the hand."——2. Pt. J. Dies, 107th Pennsylvania, aged 18 years, received a shot perforation of the right wrist; the ball lodged, having been extracted from the abdominal parietes, at South Mountain, September 14, 1862. Some days subsequently, at Frederick Hospital No. 5, Assistant Surgeon C. M. Colton performed "excision of the wrist." This patient was discharged November 18, 1862, and pensioned. Examiner D. L. Beaver reported, February 14, 1863, that the ball entered at the radial side of the right wrist and passed through transversely; that the wound in the wrist was the only disabling one, having left complete anchylosis with adhesions and wasting of the arm. In March, 1867, Dr. Beaver reported: "This pensioner has some use of hand, much more than any artificial one would be, and promising to be more useful hereafter." In November, 1871, he reported that there was partial anchylosis of the wrist, and more use of fingers than formerly, and recommended a decrease of pension. Examiner E. M. Corson reported, September 16, 1873, that "the flexor tendons were contracted to such a degree that the hand was flexed, and ring and little fingers quite rigid, and movement of wrist joint greatly impaired." Pensioner paid September 4, 1875.—— 3. Pt. E. T. Harris, Co. F, 3d New Jersey, aged 19 years, was wounded at Gaines's Mills, June 27, 1862, receiving a shot fracture of left wrist and also a wound of right knee. He was captured and taken to Richmond. The hand became tumefied, the fingers cold and blue, and an abscess formed. He was exchanged and sent to Hygeia Hospital July 20, 1862.[2] An incision had been made on the palmar aspect, and the wound was dressed with a poultice, the fingers packed in cotton batting. On July 23d, Surgeon R. B. Bontecou made an H incision on the dorsum of the carpus and removed the end of the radius, the carpal bones, and the end of the first metacarpal. The patient went home in August, 1862, doing finely. He was discharged May 8, 1863, and pensioned. Examiner J. Cumminsky certified that: "One ball entered above the right patella and lodged, and led to slight lameness after long walking. Another ball penetrated the base of the first metacarpal of the left hand and came out at the ulnar dorsal surface. The fingers are stiff from agglutination of the extensor tendons." Examiner P. H. Clark certified, July, 1867, that: "Seven of the eight bones of the carpus were removed." This pensioner died January 8, 1868. The cause of death was not reported.——The third intermediary excision proved fatal: 4. Pt. J. M. Roe, Co. E, 12th New Jersey, aged 23 years, received at Cold Harbor, June 4, 1864, a shot perforation of the ends of the right radius and ulna, involving the radio-carpal joint. He was sent to Washington. Surgeon R. B. Bontecou,[3] at Harewood Hospital, performed complete excision of the joint. The parts became gangrenous, mortification extending to the middle of the forearm. On July 23d there was recurrent hæmorrhage from the radial artery, and Acting Assistant Surgeon M. C. B. Richardson amputated in the forearm. Pyæmia set in, and the patient died August 7, 1864.——There were two secondary excisions: 5. Pt. P. Gavin, Co. F, 66th New York, aged 17 years, received a shot perforation, from palmar to dorsal aspect, of the left wrist, at Fredericksburg, December 12, 1862. He was sent to Washington, and entered Harewood Hospital. On December 31, 1862, and again five days after, there was hæmorrhage, controlled by compression. On March 28, 1863, excision of the left carpus, or, according to another report, the remaining parts of the carpal bones, was performed by Surgeon T. Antisell, U. S. V. The case progressed favorably, and the man was placed, December 17, 1863, in Co. G, 10th V. R. C. He was discharged November 28, 1865, Assistant Surgeon W. Webster certifying that "there had been an excision of left carpus." He was pensioned. Examiner C. McDermont, of Hampton, reported, August 15, 1872: "The ball entered on the dorsal surface at the extremity of the left ulna and passed out at the palmar aspect. There is partial anchylosis of the joint, the hand is diminished in size, and he cannot flex the fingers or shut the hand, etc. He has free use of the thumb, and can use his hand for many purposes." This patient died July 8, 1873.——6. Pt. A. Smith, Co. H, 183d Ohio, aged 36 years, was wounded at Franklin, November 30, 1864, the ball entering the left wrist at the base of the fifth metacarpal, and emerging at the base of the first metacarpal, fracturing the extremity of the ulna. He was sent from Nashville to the Marine Hospital, Cincinnati, in May, 1865. Professor G. C. Blackman, May 17, excised the carpus, and reported the case as a recovery. The man was mustered out July 17, 1865, and pensioned. The Examining Board of Cincinnati reported, September 13, 1875: "Shot fracture of left carpus, with much deformity. Anchylosis of wrist; inability to use fingers; atrophy of forearm; hand useless; disability permanent." This pensioner was paid December 4, 1875.

[1] KNOTT (J. J.), *Successful Resection of the Entire Wrist Joint*, in *Med. and Surgical Reporter*, 1868, Vol. XIX, p. 454; and THOMPSON (J. W.), *Report on Resections of the Long Bones*, in *The Medical Record*, 1868, Vol. IV, p. 172. Dr. THOMPSON examined this man at Paducah 4½ years after the excision, and states "this continues to be a very useful limb, and is of great service to its owner."

[2] In Dr. R. B. BONTECOU'S printed but unpublished collection of cases and operations at Hygeia and Harewood, this case is printed at page 76.

[3] BONTECOU (R. B.), in the unpublished extract of cases before mentioned records this case (*op. cit.*, p. 81), but not the fatal termination; a fair prospect of recovery being present at the date of his report.

The first of the series of partial excisions is a fatal intermediary excision of the distal ends of the radius and ulna, together with two carpals of the first row:

CASE 1942.—Private W. I. Bartlett, Co. E, 28th Massachusetts, aged 38 years, at the Wilderness, May 5, 1864, received a shot comminution of the lower ends of the bones of the left forearm. He was sent to Mt. Pleasant Hospital, Washington, and on May 23, 1864, Acting Assistant Surgeon H. B. Knowles, through two incisions along the borders of the radius and ulna, excised the injured portions of the bones of the forearm and the cuneiform and pisiform. The wrist was but little swollen at the time of operation. The limb was placed at first upon a pillow, and then upon a padded lateral angular splint. Inflammatory reaction was comparatively slight, and the patient was sent to his home at Marblehead, July, 1864. Dr. H. H. F. Whittemore certified that at the expiration of his furlough his health was failing rapidly and he was unable to travel. "The only hope of saving his life was by amputating his arm above the elbow, which was done, July 17, 1864. At the end of three weeks the stump sloughed and there were frequent hæmorrhages, causing the patient to sink rapidly, till he was relieved by death, August 11, 1864."

There were four recoveries after two primary and two intermediary excisions of the distal ends of the radius and ulna.

CASES 1943–1946.—The primary cases were those of: 1. Pt. J. C. Hibson, Co. C, 48th New York, aged 19 years; was struck by a canister shot at the lower end of the radius, at Fort Wagner, July 18, 1863. He was taken to Hilton Head, and, July 20th, Assistant Surgeon J. E. Semple excised three and a half inches of the carpal end of the radius and an inch and a half at the lower end of ulna through a medium dorsal incision four inches long. The progress was favorable. The forearm was put on a padded splint. The limb shortened considerably, with atrophy. The lower end of the ulna united with the carpus, and there seemed to be osseous deposit filling up the interspace between the excised ends of the radius and the wrist, which was anchylosed. Movement of the fingers when the man was transferred to the V. R. C., January 5, 1864. He was discharged July 10, 1864, and pensioned. Examiner T. F. Smith certified, July 10, 1865: "Resection of three inches of radius and two of ulna; the latter has united with the carpus, the former has not been reproduced." In September, 1873, Dr. Smith reported: "The hand is twisted inward and is cold and clammy, and for the purposes of manual labor is useless."——2. Pt. J. W. Vanderburgh, Co. H, 9th New York Artillery, aged 21 years, received at Monocacy, July 9, 1864, a comminution of the right radius and ulna, opening the joint. The bones protruded through the flesh. He was sent to Patterson Park, Baltimore, and, July 10th, Acting Assistant Surgeon A. V. Cherbonnier excised, through a dorsal incision four inches long, the inferior extremities of the radius and ulna and numerous fragments, as shown in the wood-cut (FIG. 723). Treated at first by refrigerant applications and afterward by oakum dressings. This soldier was discharged and pensioned February 13, 1865. Examiner O. E. French, of Kansas, certified, March, 1871, that: "* * The parts have kindly healed; but, for want of care, the hand has curved or drawn over laterally to the ulnar side, leaving it perfectly useless."——The two intermediary cases are those of: 3. Pt. T. Donahoe, Co. B, 26th Ohio, aged 32 years; was wounded December 31, 1862, at Stone River, and sent to Nashville. Surgeon H. J. Herrick reported that the patient entered Hospital No. 13 January 5, 1863, and that on January 16th two inches of the distal extremities of the radius and ulna were resected. Inflammatory reaction was not great, and on February 18th the wound had healed. The patient was discharged May 19, 1863, and pensioned. Examiner W. Waddell, of Chillicothe, reported, March 28, 1866: "Resection of two inches of ends of bones of left forearm; limb two inches shortened; left hand useless." Examiner J. Baker, of Jefferson City, reported, August, 1872: "He suffers much from neuralgic pain; there is anchylosis of the wrist joint."——4. Pt. J. W. Hale, Co. B, 72d New York, aged 23 years, was wounded at Williamsburg, May 5, 1862. He was sent to Patterson Park, Baltimore, and on May 20, 1862, excision of a half inch of the distal end of the ulna with fragments of the radius was practised. He recovered with partial anchylosis of the wrist, and was discharged September 3, 1862, and pensioned. Examiner J. D. Ford, of Winona, reported, March 13, 1863: "A musket ball entered the ball of the left thumb and passed out at the carpal extremity of the ulna, fracturing both bones of the forearm." Examiner O. A. Simmons, of Jamestown, N. Y., reported, September 9, 1873: "Ulna is sub-luxated; adhesion of tendons has resulted, so that the fingers cannot be flexed; the hand consequently greatly impaired for purposes of manual labor." This pensioner was paid December 4, 1875.

FIG. 723.—Excised distal fragments of right radius and ulna. *Spec.* 2881.

Twenty-six excisions of the distal end of the radius only included fifteen primary, seven intermediary, two secondary operations, and two of uncertain date. There were two fatal cases, one each in the categories of primary and intermediary excisions.

CASES 1947–1972.—The recoveries after primary excisions are arranged alphabetically: 1. Pt. H. Blaisdell, Co. I, 9th New Hampshire, aged 18 years, received at Petersburg, July 30, 1864, a comminution of the carpal end of the right radius by a musket ball, which inflicted also a flesh wound of the hip. The lower end of the radius was excised the same day, on the field. The patient was sent to City Point, and afterward to David's Island, and discharged December 8, 1864, and pensioned. Examiner I. S. Chase, of Bristol, N. H., reported, October 27, 1866: "The right wrist is anchylosed, the bones and tendons destroyed; the hand at right angles with the forearm, and is totally lost for labor, and is much in the way." Examiner J. A. Davis, of Lebanon, September 4, 1873, found "the hand at right angle, almost useless; atrophy of the muscles of the forearm."——2. Pt. T. Coffee, Co. K, 112th New York, aged 21 years, received at Cold Harbor, June 1, 1864, a comminution of the lower part of the right radius by a small shell fragment. On the following day an excision of the lower half of the radius was performed. The patient was sent to Finley Hospital, Washington, and discharged June 29, 1865, and pensioned. Examiner J. Phillips, of

Washington, reported, April 17, 1867: "Exsection of five inches of lower end of radius for gunshot wound of right wrist joint. Cannot flex hand upon wrist." In May, 1867, this man re-enlisted in one of the veteran reserve regiments.——3. Pt. S. G. Conk, Co. I, 11th New Jersey, aged 23 years, received at Petersburg, November 10, 1864, a shot comminution of the right radius near the wrist, and simultaneously a wound of the left index finger, necessitating its amputation. Surgeon H. F. Lyster, 5th Michigan, excised two and a half inches of the distal extremity of the right radius, and removed the ball, which had entered the latissimus dorsi at the lower border of the axillary space and lodged subcutaneously over the scapula. Acting Assistant Surgeon G. K. Smith reported that the patient entered Armory Square Hospital "December 6, 1864, with phlegmonous erysipelas involving the dorsal surfaces of the hand and forearm. The case progressed favorably and there seemed promise of a fair use of the wrist joint and fingers, but muscular contraction gave a strong tendency to shortening of the callus and deflection of the hand to the radial border. This was counteracted, however, by appropriate splints and bandaging." The patient was discharged April 8, 1865, and pensioned. Examiner R. E. Van Gilson certified, March 23, 1866: "The hand is strongly drawn inward." Examiner C. McDermont certified, June 20, 1872: "The ball fractured the lower extremity of the right radius, which was removed to the extent of about three inches. The hand is contracted firmly to the radial side and pronated. The lower end of the ulna projects beyond the carpus, the scaphoid and semilunar lying against the radial side of the ulna, placing the hand almost at right angles with the arm. There is no joint at the wrist; the hand is connected by tendons agglutinated by fibrinous deposits so firm as to admit of little motion. The skin is tender and red over the projecting end of the ulna. The hand and fingers are stiff and partially paralyzed. He can only flex them far enough to touch the end of the thumb when bent to meet them. He has good use of the thumb, and can use the hand for a great variety of purposes, in eating, dressing, and seizing light objects; but for the purpose of manual labor the injury is equivalent to loss of a hand and is permanent." Dr. McDermont transmits with his report an outline tracing of the mutilated limb, which is reduced and copied in the wood-cut (FIG. 724). This pensioner was at Hampton, September 4, 1875.——4. Sergt. P. Dammel, Co. I, 79th Pennsylvania, aged 23 years, received at Hoover's Gap, June 26, 1863, a comminution of the lower end of the right radius by a conoidal ball. The following day one and a half inches of the radius was excised. The patient was sent to York, Pennsylvania, and discharged March 28, 1864, with complete anchylosis of the wrist. Examiner P. S. Klinger, of Conestoga, reported the muscles of the forearm agglutinated and inability to close the hand. The Lancaster Board, January 6, 1875, reported the hand thrown out of position; inability to close it; the hand utterly useless, etc."——The next six cases were all comminutions of the carpal end of the radius by musket balls, followed by immediate excisions of the articular end of the bone with more or less of its shaft. All six patients recovered with stiff and greatly deformed limbs, and were pensioned. The dates of injury and pension reports will be briefly noted: 5. Corp. J. Haley, Co. C, 4th Vermont, aged 21 years, Cedar Creek, October 19, 1864. Excision of two and a half inches of lower end of right radius at 2d division, Sixth Corps, field hospital. Sent to Baxter Hospital, Burlington, and discharged May 29, 1865. Special Pension Examiner A. L. Lowell gave a minute account of the appearance of the wrist April 23, 1870. The hand was dislocated to the radial side, the integument over the projecting lower end of the ulna was red and sensitive, the temperature of the right hand slightly reduced, its prehensile power seriously impaired, pronation and supination fairly efficient, and muscles of arm and forearm well developed. Examiner C. S. Allen, of Rutland, February 12, 1872, refers to enlargement of the distal end of the ulna, and pronounces the member an encumbrance. This pensioner was paid December 4, 1875.——6. Sergt. O. Johnson, 139th New York, aged 36 years, Petersburg, August 21, 1864. Excision, an hour after the injury, of three and a half inches of the carpal end of the left radius through a linear lateral incision six inches long on the outer border. Sent to De Camp Hospital, and discharged February 6, 1865. Examiner J. T. Burdick reported, October 31, 1866, that the hand was drawn to an angle of 90° with the ulna, which report was corroborated by the Brooklyn Examining Board in 1873–'75. Dr. E. D. Hudson supplied the pensioner, who was paid December 4, 1875, with an apparatus, but the deformity admitted of but little assistance from any appliance.——7. Pt. J. Little, Co. G, 5th Michigan, aged 40 years, Spottsylvania, May 12, 1864. Regimental Surgeon H. F. Lyster excised the carpal end of the right radius on the field. He was sent to Mt. Pleasant Hospital, and discharged September 26, 1864. Examiner J. Nichols reported that the ball had entered on the palmar surface, passed diagonally downward through the radius and carpus, and emerged on the dorsum of the hand; the latter was "left completely useless, and had better been amputated." Examiner D. Alsdorf, of Corunna, reported, October, 1875, hand drawn to radial side; lower end of ulna projects, and is tender and in the way. Has no use of any of the fingers or of the hand for any purpose; it is only an encumbrance.——8. Pt. T. Lockard, Co. D, 44th Illinois, aged 30 years, Kenesaw, June 22, 1864. Surgeon H. E. Hasse, 24th Wisconsin, the same day excised two inches of the lower end of the left radius. He was sent to No. 1 Hospital, Nashville, and thence to Jeffersonville, and discharged March 26, 1865. Examiner S. S. Cutter, of Coldwater, certified, October 20, 1865: "There is perfect anchylosis and partial luxation of the wrist; the hand was flexed inward laterally at an angle of about 45°." In 1873 the same examiner reports: "There is no restoration of bone or cartilage. There is cardiac affection, believed to have resulted from the injury." This pensioner was paid September 4, 1875.——9. Pt. M. McGill, Co. E, 22d Wisconsin, aged 30 years, Dallas, May 26, 1864. Excision on the field of three and a half inches of lower end of left radius. Sent to Harvey Hospital, Madison. Discharged July 1, 1865. Examiners L. J. Barrows and G. W. Burrall certified, in 1865 and 1873, that the wrist was anchylosed with great deformity, the hand displaced inward at right angles to the forearm, the fingers paralyzed. The ball had removed the little finger and injured the ring finger of the right side.——10. Pt P. McKenna, Co. H, 158th New York, aged 38 years, Chapin's Farm, September 29, 1864. Immediate excision on the field, by Surgeon G. De Landre, 158th New York. He was sent to David's Island Hospital, and discharged August 12, 1865. Examiner C. Rowland, of Brooklyn, reported anchylosis following total loss of three inches of radius, and rendering the limb useless. The Brooklyn Examining Board, September, 1873, reported that: "Retraction of tendons has drawn the hand up to the side of the ulna, which greatly projects." This pensioner, residing

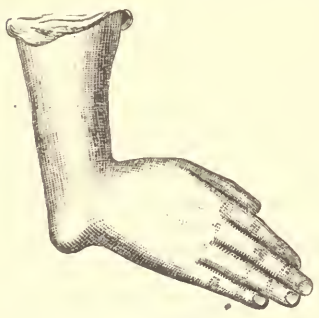

FIG. 724.—Sketch of forearm and hand laid with its palmar aspect on a flat surface.

at 194 Church Street, Brooklyn, was supplied with an apparatus by Dr. E. D. Hudson, and was paid September 4, 1875.——11. Pt. E. Small, Co. C, 33d Massachusetts, aged 25 years, Lookout Mountain, October 28, 1863. Excision of lower sixth of left radius. Sent to Cony Hospital, Maine. Discharged January 19, 1865, and pensioned. Examiner J. W. Toward, of Augusta, stated, December 22, 1866, that the ball struck the dorsal surface of the bone, passed obliquely upward and inward, and emerged on the palmar surface. Three inches of the carpal end resected. Head of ulna projects; the hand bent nearly at right angle toward the radial side; can bend the fingers but little; cicatrix tender and painful; an artificial limb would be far preferable. The Augusta Examining Board in 1873 and 1875 concurred in this estimate. The pensioner was paid September 4, 1875.——In the next three cases primary excisions were followed by successful amputations in the forearm: 12. Sergt. H. Shannon, Battery A, 14th New York Artillery, Petersburg, June 17, 1864. Excision of carpal end and two inches of shaft of left radius. Sent to Mt. Pleasant Hospital. Acting Assistant Surgeon S. F. Ford, July 5, 1864, removed the forearm at middle third by circular incision (TABLE CXXXV, No. 225, p. 983). The patient was discharged December 8, 1864. The pension record reports a healthy stump when the pensioner was paid, December 4, 1875.——13. Pt. D. A. L. Thompson, Co. B, 50th Illinois, aged 24 years, Bentonville, March 20, 1865. Surgeon J. Pogue, 66th Illinois, excised the lower end of left radius at the 15th Corps field hospital. Was sent to McDougall Hospital. Assistant Surgeon S. H. Orton, U. S. A., amputated the forearm May 18, 1865 (TABLE CXXXVII, No. 108, p. 989). The pensioner was reported at Wellington, Kansas, September 4, 1875, with a sound stump.——14. Pt. C. L. White, Co. G, 29th Massachusetts, aged 32 years, Malvern Hill, July 1, 1862. A partial excision of the lower end of the left radius was practised on the field by the regimental surgeon, O. Brown. Patient was sent to Mt. Pleasant Hospital, Washington, where Assistant Surgeon C. A. McCall amputated the forearm, August 10, 1862 (TABLE CXXXVII, No. 113, p. 989). This soldier was discharged August 29, 1862, with a sound stump, and pensioned, and furnished with an artificial limb by M. Lincoln, of Boston. In his application for commutation, in 1870, he reported the artificial limb to be of no advantage, and was worn with discomfort. The specimen (*Cat. Surg. Sect.*, 1866, p. 205), represented in the adjacent wood-cut (FIG. 725), shows the disorganization of the carpals and metacarpals from shot perforation, and the partial exsection of the radius. It was contributed to the Museum by Dr. McCall. Both rows of carpals are carious, and the preparation exemplifies the inutility of such incomplete primary operations.——One of the fifteen primary excisions of the distal end of the radius proved fatal: 15. Pt. W. H. Morgan, Co. D, 83d Ohio, Arkansas Post, January 11, 1863. Surgeon J. W. F. Gerrish, 67th Indiana, excised the lower third of the radius the same day, and the patient died February 7, 1863.——Of the seven intermediary excisions of the carpal extremity of the radius, six ended in recovery, and one proved fatal after secondary amputation of the arm: 16. Pt. J. Cohor, Co. B, 18th Infantry, aged 17 years, Dallas, May 25, 1864. He was sent to Chattanooga, where Assistant Surgeon C. C. Byrne, U. S. A., excised the carpal extremity of the left radius June 3, 1864. The patient was transferred to Nashville August 24th, and discharged September 7, 1864. His name is not found on the pension roll.——17. Pt. M. Culligan, Co. D, 40th Indiana, aged 40 years, Resaca, May 15, 1864. Sent to Nashville, where Acting Assistant Surgeon T. H. Hammond excised, May 28th, three and a half inches of the lower end of left radius. Copious purulent infiltration ensued. The patient was transferred to Louisville, to Indianapolis, and to Soldiers' Home, and was discharged May 19, 1865, and pensioned. Examiner T. Chestnut, of Lafayette, reported, July 24, 1866: "Complete anchylosis between the ulnar and carpal bones; the hand contracted on the wrist and completely useless." This pensioner died July 30, 1869.——18. Pt. G. Garment, Co. C, 20th Massachusetts, aged 26 years, Wilderness, May 6, 1864. Sent to Emory Hospital. A ragged lacerated shot wound of the right wrist was filled with healthy granulations. May 23, 1864, Acting Assistant Surgeon W. H. Ensign excised an inch and three-quarters of the carpal extremity of the radius (FIG. 726). The patient was discharged May 25, 1865, and pensioned. Examiner W. H. Page, of Boston, reported, November 5, 1866, that the ball penetrated the carpal end of the right radius from the dorsal to the palmar aspect, and that resection of the bone had resulted in complete anchylosis of the wrist. The hand is turned inward; no power over the fingers except to slightly move the ends. The hand is cold and livid and wasted, as is the whole forearm. There is a large cicatrix, where another ball perforated the soft parts above the right elbow. The Boston Examining Board, in 1870, 1873, and 1875, states: "Hand stands at an angle of 150° with forearm." The pensioner was paid September 4, 1875.——19. Pt. W. McGarrah, Co. D, 124th New York, aged 24 years, Chancellorsville, May 3, 1863. Sent to Columbian Hospital, Washington, where excision of the lower fourth of the left radius was performed some time in May, 1863, and discharged February 11, 1864, with great contraction and deformity of the wrist. Examiner W. P. Townsend, of Goshen, reported, September 4, 1873: "The hand is almost at right angles to the forearm, with complete anchylosis of the wrist, etc." This pensioner was paid June 4, 1875.——20. Pt. J. Nipple, Co. A, 110th Pennsylvania, aged 33 years, Winchester, March 23, 1862. Sent to St. Joseph's Hospital, Philadelphia. On March 30, 1862, an inch and a half of the distal extremity of the left radius was excised. April 26th, a tubular sequestrum was extracted. June 10th, patient transferred to Camp Curtin, Harrisburgh, and discharged September 5, 1862, and pensioned. Examiner J. McCulloch reported, February 13, 1871, that: "In consequence of resection the hand is drawn inward nearly at right angles, and the end of ulna sticks out below the hand." Pensioner paid September, 1875.——21. Corp. J. C. Speed, Co. G, 3d New Hampshire, aged 26 years, Deep Bottom, August 16, 1864. Sent to Balfour Hospital, Portsmouth, where Assistant Surgeon J. H. Frantz, U. S. A., August 26, 1864, excised the lower third of right radius. The patient was sent to Webster Hospital, Manchester, and discharged June 15, 1865. Examiner P. Spaulding, of Haverhill, reported, September 4, 1873: "The wrist is entirely anchylosed, the hand and fingers stiff and much deformed, and almost useless. The forearm does not rotate, and the elbow is nearly stiff. The whole arm is wasted, and useless for most purposes

FIG. 725.—Partial excision of left radius after shot perforation of wrist. *Spec.* 157. ½

FIG. 726.—Excised extremity of right radius. *Spec.* 2351. ½

of manual labor." Pensioner paid September 4, 1875.——The fatal intermediary excision of this group was followed by an amputation in the upper arm: 22. Corp. M. E. J——, Co. F, 94th New York, Antietam, September 17, 1862. Sent to the Patent Office Hospital. Acting Assistant Surgeon C. H. Boardman, October 15, 1862, found the right radius carious and excised its lower half. Successive abscesses formed; the carpus and upper extremity of the radius became carious, and on December 19, 1862, amputation was performed in the upper arm, the point of ablation being unspecified (TABLE XC, No. 11, p. 792). He sank exhausted, and died December 30, 1862.——The two secondary excisions of this group were examples of recovery with great deformity: 23. Pt. J. Boden, Co. B, 45th Pennsylvania, aged 47 years, South Mountain, September 14, 1862, received a fracture of the lower end of the left radius, a musket ball passing from the palmar to the dorsal surface. Sent to Satterlee Hospital. Abscesses formed, and, on October 17th, Assistant Surgeon E. DeW. Breneman, U. S. A., excised through an H incision the shattered extremity of the bone. There was copious hæmorrhage, and it was necessary to tie the anterior interosseous artery. The hand and forearm were laid on a well-padded Esmarch splint. The case progressed favorably, and the man was discharged April 18, 1863, and pensioned. Examiner P. S. Clinger, of Conestoga, reported, July 17, 1866: "Permanent agglutination of the muscles of the forearm and hand; no motion whatever of the wrist or fingers." Examiner S. L. Beck, of New Columbia, reported, May 19, 1875: "Joint anchylosed; hand forms a small angle deflected to the radial side." The pensioner was paid September 4, 1875.——24. Corp. P. H. Post, Co. E, 74th New York, aged 29 years, Gettysburg, July 2, 1863. Sent to Mower Hospital. Musket ball fractured the lower end of the left radius, opening the joint, and leading to diffuse suppuration; excision of the lower end of the bone was practised; eleven large fragments, constituting about two and a half inches of the end of the bone, were excised, August 6, 1863, by Acting Assistant Surgeon C. R. McLean. Patient was discharged August 22, 1864, and pensioned. Examiner O. Warner, of Paterson, New Jersey, reported, February 5, 1872: "Hand luxated to the radial side, and motion to a great extent lost; disability equalling the loss of a hand." Pensioner paid September 4, 1875. The fragments of bone are preserved as specimen 2601 in the Museum (*Cat. Surg. Sect.*, 1866, p. 183).——Two of the excisions of this group, resulting in recovery, were practised at a date after injury that has not been ascertained: 25. Pt. T. C. Mahoney, Co. A, 30th Ohio, aged 39 years, Antietam, September 17, 1862. Sent to Carver Hospital. The lower end of the left radius, comminuted by a musket ball, was excised. The patient was sent to Satterlee December 11, 1862, and discharged April 18, 1863. Examiner P. G. Clinger, of Conestoga, certified, July 19, 1864: "The hand is drawn laterally and held by the agglutination of the muscles. The fingers are stiff and hand useless; he is unable to obtain subsistence by manual labor." This pensioner re-enlisted in July, 1864.——26. Pt. *R. Berry*, 5th Louisiana, aged 37 years, Sharpsburg, September 17, 1862, received a shot perforation of the lower end of the right radius. Four and a half inches of the distal end of the bone was excised. The soldier was retired, on surgeon's certificate of disability, February 10, 1865.

FIG. 727.—Excision in radius. *Spec.* 487.

There were nineteen excisions of the distal end of the ulna—eleven primary, with two deaths; four intermediary recoveries; four secondary cases, with one death.

CASES 1973–1991.—Of the eleven primary excisions of the distal end of the ulna, nine resulted in recovery, after amputation in the upper arm in one instance: 1. Pt. *N. Bolton*, Co. K, 28th Louisiana, aged 33 years, Simonsport, May 18, 1864. Excision of the lower extremity of the right ulna was done on the field. The patient was sent to Helena, Arkansas, recovered, and was transferred to the Provost Marshal November 9, 1864.——2. Pt. R. Carrigan, Co. C, 50th Illinois, aged 22 years, Rome, May 26, 1864. Surgeon J. R. Zearing, 57th Illinois, excised an inch of the lower extremity of the left ulna, shattered by a musket ball, through a lateral incision of three inches. The patient was sent to Quincy, Illinois, and discharged January 7, 1865. His name is not on the pension list.——3. Lieut. D. F. Cheney, Co. I, 9th New Hampshire, aged 23 years, Petersburg, July 30, 1864. Excision of three inches of the lower extremity of left ulna the same day, at field hospital. Sent to Armory Square, and mustered out November 30, 1864, and pensioned. Examiner B. S. Warren, of Concord, reported, June 20, 1866: "Arm atrophied, and ring and little fingers cannot be fully flexed in consequence of adhesions and partial paralysis." Examiner H. M. Chase, of Lawrence, certified, October 1, 1873: "Excision of carpal half of ulna, deformity from loss of tissue. Can flex the fingers partially." Painful sensitiveness of the forearm, etc., is also noted. This pensioner was paid March 4, 1875.——4. Pt. D. B. Derby, Co A, 2d New Jersey Cavalry, aged 38 years, was wounded at Memphis, January 16, 1865, by the explosion of an ammunition chest, receiving comminution of the lower part of the left ulna. Assistant Surgeon J. M. Study, U. S. V., on January 18th, excised the lower extremity of the ulna, at the Adams Hospital. The patient was discharged May 24, 1865. Examiner W. W. Dale, September 28, 1875, reports: "Removal of two inches of carpal end of left ulna. There is a deep adherent cicatrix three inches in length. Although there is *very good motion of the wrist joint*, the arm is considerably weakened."——5. Pt. V. LeLarge, Co. I, 28th Massachusetts, aged 31 years, Wilderness, May 6, 1864. Excision of two and a half inches of the lower end of the left ulna was practised at the field hospital the following day. The hand was placed on a straight padded splint. The patient was sent to Chestnut Hill, Philadelphia, thence to Ladies' Home, New York, and Dale Hospital, Worcester, and discharged July 21, 1865. The Hartford Examining Board certified, September, 1873: "Two and a half inches of the lower end of the left ulna has been removed. Complete anchylosis of the wrist." This pensioner was paid September 4, 1875.——6. Pt. M. McAllister, Co. C, 5th Pennsylvania Reserves, aged 26 years, Wilderness, May 6, 1864. Excision on the field, of three and a half inches

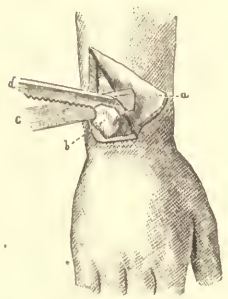

FIG. 728.—MOREAU'S method of excising the carpal end of the ulna. [After BERNARD and HUETTE.] *a*—triangular flap. *b*—ulna. *c*—thin slab of ivory to guard the saw, *d*.

of shattered ulna. Sent to Armory Square and Philadelphia hospitals, and mustered out June 14, 1865, and pensioned. Examiner C. M. Turner, of Towanda, reported, September 14, 1869: "Carpus anchylosed; fingers powerless." Pensioner paid June 4, 1875.——7. Corp. L. H. Pierce, Co. G, 85th New York, aged 28 years. Bull Run, August 30, 1862. Excision of lower end of left ulna was practised on the field. Sent to Carver Hospital, and discharged December 29, 1862. Examiner W. S. Welsh, of Franklin, Pennsylvania, reported, September 4, 1873, that there was displacement of the hand at right angles and inability to flex the fingers, the disability being equivalent to the loss of the hand. This pensioner was paid December 4, 1875.——8. Pt. G. Williams, Co. A, 154th New York, aged 21 years. Rocky Face Ridge, May 8, 1864. Two inches of the articular end of the left ulna was excised on the field the same day by Surgeon James Reily, 33d New Jersey. The patient was sent to Buffalo, New York, and discharged February 28, 1865. Examiner G. W. Hazeltine, of Jamestown, reported motions of carpus lost; no sensation in middle and ring fingers. Examiner A. Jewett, of Dayton, Ohio, reported, February 13, 1873: "Hand in pronation and cannot be supinated." Examiner H. K. Steele reported the use of the thumb and index finger as retained. Examiner R. L. Sweeney reported, December 6, 1875: "Partial luxation of wrist; want of power to rotate forearm."—— One of the primary excisions was followed, after three weeks, by amputation in the upper arm: 9. Corp. F. A. Sherman, Co. H, 11th Maine, aged 22 years. Wilderness, May 5, 1864. Surgeon H. F. Lyster, 5th Michigan, excised an inch of the distal extremity of the ulna the same day. Periostitis with caries extended up the ulna, and the limb was removed in the upper arm, May 29, 1864 (TABLE LXXVIII, No. 223, p. 766). The specimen, 2503, *Surg. Sect.*, A. M. M., is interesting. The pensioner was paid December 4, 1875, and had a sound stump.——The two fatal cases of primary excision of the distal end of the ulna are: 10. Pt. *F. M. Hardy*, 30th North Carolina, fully detailed on page 950 as CASE 1807. He also underwent an excision of the radius in the opposite forearm (See FIGS. 688, 689).——11. Pt. S. Young, Co. F, 63d New York, aged 25 years, Petersburg, June 16, 1864. Excision of a portion of the lower extremity of the left ulna, the same day, by Surgeon P. E. Hubon, 28th Massachusetts. He was sent to Carver Hospital, Washington, and, July 9th, Acting Assistant Surgeon R. E. Price resected a further portion of the shaft of the ulna. July 15th, pyæmia supervened, and resulted fatally July 27, 1864.——Four intermediary excisions of the lower end of the ulna resulted in recovery, one after submitting to amputation in the forearm: 12. Pt. J. L. Jones, Co. C, 120th Illinois, aged 21 years, Guntown, June 10, 1864. Sent to Adams Hospital, Memphis, where, June 25th, Acting Assistant Surgeon S. S. Jessop excised the lower sixth of the right ulna. The patient sent North, August 23, 1864, on the transport January. Pensioned October 22, 1864. Examiner G. Bratton, of Vienna, certified, July, 1869: "A musket ball struck the right carpus near its dorsal articulation with the ulna, and ranged upward, fracturing the ulna. The wrist joint is anchylosed and the fingers greatly shrivelled and flexed. Pensioner paid September 4, 1875.——13. Lieut. *J. R. McGowan*, Co. D, 13th Alabama, aged 23 years. Wilderness, May 8, 1864. Sent to Richmond, where, May 12, 1864, excision of four inches of the lower end of the ulna was practised. This officer was furloughed June 15, 1864.——14. Pt. W. Tyson, Co. G, 110th Pennsylvania, aged 50 years, Fredericksburg, December 13, 1862. Sent to Harewood Hospital, Washington, December 27th, excision of two inches of lower end of left ulna, and free incisions to evacuate pus which had burrowed in the metacarpus. Pensioned March 28, 1863. The Lancaster Examining Board reported, September 4, 1873: "Complete anchylosis of wrist joint; loss of control of movements of all the fingers."——The fourth intermediary case was followed by amputation: 15. Pt. E. H. Lewis, Co. E, 145th Pennsylvania, aged 18 years, was wounded at Fredericksburg, December 13, 1862. Sent to Hammond Hospital. Late in December the lower extremity of the left ulna was excised. The case progressed unfavorably, and amputation high in the forearm was practised, February 16, 1863 (See TABLE CXXXVII). March 7, 1863, there was profuse bleeding, on account of which the radial was tied in its continuity above the stump. Pensioned June 13, 1863, and paid September 4, 1875.——Three of the four secondary excisions of this group terminated in recovery, and one in death: 16. Pt. J. J. Davis, Co. F, 140th Pennsylvania, aged 27 years, Gettysburg, July 3, 1863. Sent to Satterlee, where Acting Assistant Surgeon T. G. Morton excised the lower third of the left ulna, September 3, 1863. A musket ball had perforated the bone from the dorsal to the palmar surface. To V. R. C. January 26, 1864; discharged and pensioned November 24, 1865. Examiner D. N. Rankin, of Allegheny, reports: "The ulnar nerve and artery were severed, and the hand is cold and clammy, and the sense of feeling is almost entirely destroyed. It pains him extremely in cold weather. Its motions and power are very slight." The Pittsburg Examining Board reported, September 9, 1875: "Pronation and supination are lost and the hand is weak and powerless. Equivalent to loss of hand for manual labor."——17. Sergt. J. R. Imboden, Co. C, 1st Ohio, Chickamauga, September 19, 1863. Shell fracture of lower extremity of right ulna. Sent to general hospital at Nashville, and afterward to Camp Dennison. Two months after the injury exsection of the lower end of the bone was performed, and the patient was returned to duty in V. R. C. August 20, 1864. March 1, 1867, Brevet Major Harvey E. Brown, Assistant Surgeon, U. S. A., in his report on soldiers of the 1st Infantry wounded during the war, mentions this man as a private of Co. H, enlisted June 6, 1865: "There was considerable deformity about the wrist, and he is troubled with numbness of the index and middle fingers, and has rather imperfect use of hand, but is able to perform his duties as a soldier."——18. Pt. *J. Quinland*, Co. C, 6th Louisiana, aged 34 years, Chancellorsville, May 3, 1863. Sent to Charlottesville. Professor J. L. Cabell noted that, in consequence of a shot perforation of the left carpal articulation, the lower end of the ulna, projecting, was resected to the extent of one inch, November 1, 1863. In December the wound was nearly healed; there was some motion about the joint, though the fingers were stiff, the whole limb somewhat atrophied, and the movement of the elbow joint and forearm imperfect, supination being almost lost. The Richmond Retiring Board retired this soldier on certificate of permanent disability February 13, 1865. The certificate is filed in the War Department, and states that there was "paralysis of all the extensor muscles of the forearm, with total inability to use the hand." This case is also noted in the manuscript register of Dr. H. L. Thomas, to be cited hereafter.——19. Sergt. J. N. Chestnut, Co. C, 6th Wisconsin, Antietam, September 17, 1862. Extensive sloughing followed a musket-ball fracture of the lower end of the right ulna. Sent to Frederick Hospital No. 6. Surgeon J. B. Lewis, U. S. V., December 2, 1862, excised three and a fourth inches of the lower end of the ulna (FIG. 729). Some of the fragments agglutinated by callus are seen attached to the lower end of the bone, and osteophytic deposits extend up the shaft. The patient wasted away gradually, and died January 22, 1863.

FIG. 729.–Excised distal extremity of right ulna. *Spec.* 3584.

Next in order are six recoveries after four primary and two secondary excisions of the lower end of the radius, with one or more of the carpals. It is proper to discriminate this group, because, as Malgaigne observes,[1] the radio-carpal synovial membrane lines only the articular end of the radius and upper surfaces of the scaphoid, semilunar, and cuneiform bones; but as soon as the ligaments of the latter are cut into, another great synovial sac is opened, overlapping all the bones of the carpus except the pisiform.[2]

CASES 1992–1997.—Four primary excisions include: 1. Pt. J. Harper, Co. I, 38th Illinois, aged 23 years, Kenesaw Mountain, June 27, 1864. Surgeon J. D. Brumley, U. S. V., at the 1st division, Fourth Corps hospital, the same day excised the lower portion of the right radius and adjacent carpal bones. The ball had also inflicted a flesh wound just above the crest of the right ilium. Sent to Cumberland Hospital, Nashville; recovered, and re-enlisted in his regiment (*Adj. Gen. Report of Illinois*, Vol. IV, p. 455). Pensioned November 14, 1865. Examiner L. W. Low reported, March 19, 1867: "Atrophy of the entire arm and displacement of hand, which is at a right angle with the forearm looking inward, the lower end of ulna projecting, the wrist anchylosed, but not the finger joints." Examiner F. Ronalds reported, September 9, 1873: "Lower extremity of radius gone, hand useless." Pensioner paid September 4, 1875.——2. Pt. J. L. Miller, Co. C, 16th Kentucky, aged 17 years, Altoona, June 14, 1864. Surgeon J. H. Rodgers, 104th Ohio, excised on the same day four inches of the lower end of the left radius and the first row of carpals except the pisiform. Sent to Nashville, and pensioned March 12, 1865. Examiner T. W. Gordon, of Georgetown, reported, November 16, 1865: "Several of the carpal bones and four inches of the radius have been removed." The Cincinnati Examining Board reported, September 6, 1873: "Large depressed firmly adherent cicatrix on dorsum of left wrist; four inches of lower end of radius exsected; ligamentous union with great deformity; grasp of hand feeble; impaired circulation." Examiner S. V. Firor, of Catlettsburgh, Kentucky, certified, September, 1875: "The hand is drawn inward at an angle of 95° and is entirely powerless."——3. Pt. G. W. Taylor, Co. H, 70th Ohio, accidentally, at Dallas, May 29, 1864. Surgeon J. H. Hutchinson, 15th Michigan, the same day excised the lower end of the left radius, the scaphoid and semilunar, and fragments of other carpals, at a field hospital of the 15th Corps. Examiner T. W. Gordon certified, May 14, 1870: "A musket ball entered the palmar radial side of the left wrist and passed out at dorsal side of the head of the first metacarpal, fracturing the second also. The thumb is useless though not entirely anchylosed; the fingers are permanently flexed; the second metacarpal is thickened and arched up on the back of the hand. The injury is permanent, yet, as he has the use of the hand as a hook, I cannot say that the injury is equivalent to the loss of a hand." Examiner J. Shackleford, Maysville, Kentucky, testifies to "tenderness of cicatrix from retention of buckshot in track of wound." Pensioner resides at Bradyville, Ohio, and was paid June 4, 1874.——4. C. Murphy, 16th New York or Massachusetts (?), July, 1862. Sent to Naval Academy Hospital, Annapolis. Excision of lower end of left radius and fractured portions of carpus. Recovered.——The two secondary excisions of this group resulted in anchylosis with deformity: 5. Pt. L. S. Bard, Co. I, 1st Pennsylvania Rifles, South Mountain, September 14, 1862. Shot fracture of right carpus and lower end of radius. Sent to Frederick, where Assistant Surgeon C. Bacon, jr., October 27, 1862, excised the lower part of the radius, the scaphoid, trapezoid, and os magnum. Pensioned December 23, 1862. Examiner B. S. Gould, of Port Allegany, reported, March 30, 1863: "No use of hand or wrist. Had a flesh wound in right shoulder, of little account." Examiner S. D. Freeman, October 17, 1873, stated that the ball destroyed the carpus and lower end of the right radius. Pensioner paid September, 1875.——6. Pt. J. A. Byrd, Co. A, 99th Illinois, aged 28 years, Vicksburg, May 22, 1863. Shot wound of right wrist, injuring carpus and radius. He was sent to Jefferson Barracks. Acting Assistant Surgeon F. F. Rumbold, March 7, 1864, found the bones carious, and removed the lower end of radius and first row of carpals. Pensioned April 20, 1864. Examiner H. Jones reported anchylosis of wrist, immobility of entire hand. This pensioner died of phthisis July 21, 1869.

There were ten excisions of the lower extremity of the ulna together with one or more of the contiguous carpal bones. Fatal results followed two of these operations:

CASES 1998–2007.—There were five primary operations, of which one was fatal: 1. Pt. B. A. Bonewell, Co. F, 140th Pennsylvania, Gettysburg, July 2, 1863. Surgeon C. S. Wood excised the lower end of the left ulna, splintered by a musket ball, together with the cuneiform and pisiform, the day of injury, at the Second Corps hospital. Sent to Pittsburg Hospital, and pensioned December 26, 1863. The Pittsburg Examining Board reported, October 11, 1873: "Anchylosis of wrist; fingers contracted in palm." Pensioner paid September 4, 1875.——2. Pt. P. Euler, Co. H, 50th Illinois, aged 28, Resaca, May 16, 1864. Excision of two inches of end of left ulna and adjacent carpal bones on May 17th, through a straight lateral incision. Sent to Chattanooga, and pensioned May 18, 1865. Examiner H. C. McPherson certified, March, 1867, that the disability was equivalent to the loss of a hand. This pensioner died November 27, 1869, of pulmonary disease, remotely due, in the opinion of the attending physician, to prostration following the injury.——3. Major C. W. Hobbs, 7th New York Artillery, aged 22 years,

[1] MALGAIGNE (J. F.), *Manuel de Médecine Opératoire*, 7ème éd., 1861, p. 227.

[2] Of the experience of the French surgeons of shot injuries of the wrist joint in the Franco-German War of 1870–71, M. SÉDILLOT (*Fract. des membres par armes de guèrre*, in *Arch. gén. de méd.*, 1871, p. 417) writes: "Fractures of the radio-carpal joint were not very common, and attempts at conservation found few partisans." The number and size of the bones entering into the articulation, the close vicinity of large vessels, the multiplicity of tendons and bursæ, the liability of suppuration, adhesions, and anchylosis, and of immobility of the fingers, are serious counter-indications to conservative essays; although the hand, however deformed and powerless, remains an appendage of some service. These reasons led us to reject not only conservation but resection, which I never practised, and, indeed, never saw practised. Nevertheless it is evident that, where disorganization is not very great, where only, for example, the lower ends of the radius or ulna or the first row of carpals may be injured, without extensive lesions of the bones or tendons, conservation or partial resection ought to be attempted; but where the radius is splintered, the joint largely opened, the ligament and tendons torn, amputation is necessary, and that this operation even cannot be depended on to save life if it be *deferred*, as we shall illustrate further on. Surgery requires new researches on this subject, and a detailed analysis of more facts."

Cold Harbor, June 3, 1864. The regimental surgeon, J. E. Pomfret, afterward Surgeon General of New York, directly after the injury excised the shattered distal extremity of the ulna, the cuneiform, pisiform, and unciform bones, the fourth and fifth metacarpals, and the greater portion of the third metacarpal, removing the middle, ring, and little fingers. The patient was sent to Armory Square. The case progressed very favorably, and recovery took place without anchylosis of the remaining portion of the radio-carpal articulation or impairment of the movements of the thumb and forefinger. The major was mustered out and pensioned July 3, 1865. The functional activity in the remaining portions of the carpus, metacarpus, and phalanges was remarkable.[1] September 21, 1867, this officer was appointed second lieutenant, 3d Artillery, with which regiment he still serves. The appearance and extent of motion of the hand is indicated in the wood-cut (FIG. 730).——4. Corp. *A. J. Pulliam*, Co. F, 17th Mississippi, aged 29 years, Gettysburg, July 2, 1863. Assistant Surg. W. H Gardner, U. S. A., reports that a shell injury of the right hand, attended by great laceration of the soft parts and comminution of the lower end of the ulna and contiguous carpal and metacarpal bones, required immediate excision of the splintered bones by the saw and cutting pliers. It was difficult to get flaps of integument to cover in the sawn extremities of the bones. The patient was sent to Hammond Hospital. Refrigerant applications were perseveringly employed until September 20th, when pus burrowed among the tendons, pointing at the base of the first metacarpal. Inflammation subsided after incisions and applications of dilute tincture of iodine. Healthy granulation went on, and by October 10th the wound had entirely healed. The man's health was good, and "he had partially recovered the use of the hand." On December 5, 1863, he was transferred to the prisoners' camp, at Johnson's Island.——The fatal primary case of this subdivision was that of: 5. Sergeant B. Stebbins, Co. I, 86th Illinois. In the report of Surgeon E. Swift, U. S. A., "of the medico-military history of the Department of the Ohio," it is stated that this man, a convalescent in Hospital 24, Nashville, while taking a walk, received a shot perforation of the right wrist, shattering the carpus and end of ulna, by a musket ball accidentally discharged, February 24, 1863. He was immediately taken to Hospital 21, where Acting Assistant Surgeon Lyman reported that: "For two days he suffered severely from tetanic spasms, when it was decided to excise two inches of the inferior extremity of the ulna and carpal bones as far as necessary." After the operation the tetanic symptoms did not return, but the patient sank, and died March 7, 1863.——There were four intermediary operations in this sub-group, with one death: 6. Lieut. W. D. Davenport, Co. H, 5th Vermont, aged 21 years, Wilderness, May 5, 1864. Musket-ball fracture of end of left ulna, involving wrist. Sent to Seminary Hospital, Georgetown, May 15, 1864. Act. Ass't Surgeon J. M McCalla excised the lower third of ulna and adjacent carpal bones. Pensioned September 15, 1864. Examiner C. L. Allen, of Rutland, certified, September 4, 1873: "The ball entered the back of the forearm near the left wrist, injuring the ulna and several of the carpal bones, making its exit in front. The wrist is perfectly stiff and the hand useless, except that the thumb and index finger are somewhat useful though not strong. The third, fourth, and fifth fingers are stiff and contracted." Pensioner paid September 4, 1875.——7. Pt. J. Hoover, Co. A, 62d Pennsylvania, aged 26 years, Spottsylvania, May 12, 1864. A musket ball passed through both wrists.[2] The right forearm was amputated on the field (TABLE CXXXIII, No. 427, p. 973). Sent to Judiciary Square. May 30th, Assistant Surgeon A. Ingram, U. S. A., excised the greater part of the left carpus and carpal ends of the ulna and first metacarpal. Pensioned May 18, 1865. Examiner G. C. Ewing, of Uniontown, Pennsylvania, reports, August 10, 1865: "Wrist and thumb wholly immovable; a little motion with the fingers; cannot grasp anything; the left hand is almost if not altogether useless for purposes of manual labor." Commutation paid February 28, 1876.——8. Pt. J. C. Hopkins, Co. I, 44th Illinois, aged 18 years, Kenesaw, June 27, 1864. Shot comminution of left ulna, carpals, and metacarpals of thumb, index, and middle fingers. Sent to Mound City Hospital. Acting Assistant Surgeon J. G. Harvey, July 14, 1864, excised the lower end of ulna and fragments of carpals and metacarpals. Gangrene ensued. Pensioned March 4, 1865. Examiner E. A. Clark, of St. Louis, reported: "Complete anchylosis of wrist joint; paralysis from laceration of nerves, etc." Examiner J. B. Bell, of Potosi, reported, September 4, 1873: "Contraction and atrophy of all the fingers of the left hand." Pensioner paid September 4, 1875.——The fatal intermediary excision of this description was that of: 9. Pt. G. W. Bowers, Co. B, 35th Ohio, aged 23 years, Dallas, June 3, 1864. Musket ball perforation of left wrist, fracturing ulna. Sent to Nashville. Acting Assistant Surgeon R. L. McClure, June 21, 1864, excised an inch and a half of the left ulna and removed several fractured carpal bones. Pyæmia ushered in by rigors and vomiting supervened, and the patient died July 11, 1864.——A successful secondary case, illustrated by a preparation, is that of: 10. Private W. Birdsall, Co. B, 49th Colored Troops, aged 25 years, Vicksburg, September 1, 1865, accidentally, by a musket ball, implicating the right wrist. Acting Assistant Surgeon G. F. Rockwell found, November 1, 1865, at the post hospital, a small fungous ulcer on the external surface of the ulna, "indicating necrosis," and excised two and a half inches of the lower extremity of the ulna and the semilunar bone. The hand was placed on a padded splint and the patient was allowed generous diet. Dr. Rockwell reports that the patient was discharged March 22, 1866, "with full use of hand and tolerable use of wrist." The specimen (FIG. 731) indicates a slight superficial caries of the distal end of the ulna; the styloid process has been sawn off. There is no record of this soldier at the Pension Office.—See *Cat. Surg. Sect.*, 1866, p. 199.

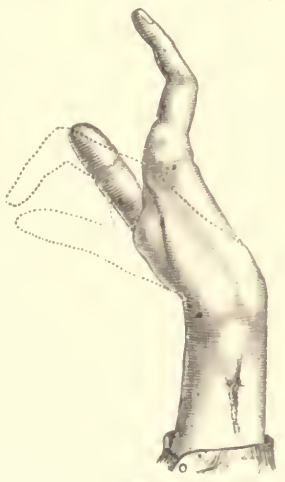

FIG. 730.—Left hand after ablation of portions of ulna, carpus, metacarpus, and three fingers. *Spec.* 2786.

FIG. 731.—Distal end of ulna and semilunar excised secondarily. *Spec.* 2987.

Thirteen excisions, more or less complete, of the carpal bones resulted in nine recoveries and four deaths—one of the patients recovering after consecutive amputation in the forearm:

[1] Two plaster casts (*Specs.* 1133 and 2786) in the Museum represent the results in this remarkable case. One of them is copied in the wood-cut. A number of photographs (as Surg. Phot., A. M. M., No. 59, and six photographs contributed by Professor J. H. ARMSBY, of Albany. *Contrib. Phot.*, A. M. M., Vol. V) illustrate this case.—See *Circular* No. 6, S. G. O., 1865, p. 54.

[2] See Surgical Report, in CIRCULAR 6, S. G. O., 1865, p. 54.

CASES 2008–2020.—There were eight primary operations, of which two proved fatal: 1. Pt. G. H. Alley, Co. B, 99th Indiana, aged 23 years, Dallas, May 28, 1864. Surgeon D. Halderman, 46th Ohio, excised the scaphoid and fragments of adjacent carpal bones immediately after the injury, on account of a musket-ball fracture of the left wrist, at the Fifteenth Corps field hospital. Patient sent to Murfreesboro', and was returned to duty July 9, 1864, and mustered out May 22, 1865. His name is not on the pension list.——2. Corp. S. Brockman, Co. C, 13th Kentucky, Resaca, May 15, 1864. A shell fragment fractured the left wrist. On May 17th, "a partial excision of the carpal bones was practised." He was sent to the hospital at New Albany, Indiana, where it was reported that there were portions of dead bone yet to be removed. Discharged January 12, 1865. Examiner A. W. Reese, of Warrensburg, certified, December 16, 1874: "Great deformity of hand and wrist. * * Anchylosis of wrist, with displacement and twisting inward of hand, which is immovable and entirely useless for all practical purposes. He would be better off to-day if his hand had suffered amputation above the wrist." Pensioner paid September 4, 1875.——3. Col. A. W. Dwight, 122d New York, Cedar Creek, September 19, 1864. Surgeon G. T. Stevens 77th New York, excised the semilunar, cuneiform, and pisiform bones, shattered by musket ball (another report says "outer half of carpus"), at the 2d division, Sixth Corps, field hospital. This officer resumed command of his regiment in less than two months, having a serviceable hand.[1] He was subsequently killed in action, at Petersburg, March 25, 1865, while leading a charge.——4. Corp. J. Estes, Co. H, 27th Massachusetts, aged 25 years, accidentally, at New Berne, December 28, 1862. A conical ball from a small-sized Smith and Wesson pistol was impacted in the left os magnum. Surgeon G. A. Otis, 27th Massachusetts Vols., reported: "Various attempts at extraction having been vainly essayed by the forceps and *tire-fond*, with the concurrence of Surgeon B. B. Breed, U. S. V., and Surgeon G. Derby, 23d Massachusetts, an incision was made between the flexor tendons, and the ball was finally brought away by means of the gouge, the greater portion of the os magnum being removed in the operation. The joint was covered with ice and the inflammatory reaction was less intense than was anticipated." The regiment moving a few days subsequently, the patient was sent to Foster Hospital. Surgeon E. P. Morong, U. S. V., reported that the inflammation of the tendons impaired the functions of the hand. The patient was transferred to Beaufort, June 18, 1863. Surgeon F. G. Ainsworth, U. S. V., reported this man's transfer to the Veteran Reserve Corps August 14, 1863. He was mustered out in 1865, and his name is not on the pension roll.——5. Corp. W. C. Turner, Co. E, 33d Massachusetts, aged 35 years, Dallas, May 25, 1864. Medical Director H. S. Hewit reports an excision of left wrist joint, for fracture by conoidal musket ball, the day of injury. Patient was sent to Readville, and transferred to V. R. C. February 3, 1865; pensioned June 1, 1865. Examiner Q. A. McCollister, of Groton, reports: "The hand is turned laterally toward the radial side. The thumb is stiff and not of much use in picking up articles or holding anything." Pensioner paid September 4, 1875.——In the next case amputation in the forearm was resorted to: 6. Pt. C. Funke, Co. B, 49th New York, aged 24 years, Fisher's Hill, September 22, 1864. Surgeon G. T. Stevens, 77th New York, excised a portion of the bones of the right carpus on account of fracture by musket ball. Sent to Satterlee Hospital. Intense inflammation supervened, and October 13, 1864, Acting Assistant Surgeon W. P. Moon amputated in the upper third of the forearm (TABLE CXXXV, No. 28, p. 981). Pensioned July 4, 1865, and paid September 4, 1875. ——The two fatal cases were as follows: 7. Pt. J. Gordon, Co. B, 7th Indiana, Marietta, June 27, 1864. Assistant Surgeon R. McGowan, U. S. V., reported an excision of the wrist joint, practised the day of injury, on account of a shot perforation of the left carpus. The patient was sent to Chattanooga. He had also a shot flesh wound of the leg. He died July 28, 1864.——8. Pt. W. McLoughlin, Co. D, 63d New York, aged 27 years, Wilderness, May 7, 1864. Surgeon Nathan Hayward, 20th Massachusetts, excised, on account of a shell fracture, all the bones of the left carpus except the trapezium and trapezoid. The patient was sent to Emory Hospital, and died March 28, 1865.——There was one fatal intermediary excision in the carpus: 9. Capt. A. Clark, Co. C, 8th Illinois Cavalry, aged 41 years, received at Beverly Ford, June 9, 1863, a wound of the left wrist, which shattered the os magnum and unciform. Surgeon H. W. Ducachet, U. S. V., reported that on the patient's admission to Georgetown Seminary Hospital the wrist was intensely painful and swollen, and that on June 22d free incisions were made into the joint and the shattered unciform and magnum were excised. July 3d, there was severe rigors and other signs of pyæmia, and the patient died July 5, 1863. *Post-mortem:* A large abscess was discovered dissecting its way up the interosseous ligament. ——There was a successful and a fatal secondary excision in the carpus: 10. Pt. G. W. Neal, Co. D, 3d Wisconsin, Dallas, May 25, 1864. Musket-ball fracture of ulnar side of left carpus; ball entering the dorsal and emerging on the palmar surface. Sent to Madison, Wisconsin. June 27th, Surgeon H. Culbertson, U. S. V., made an incision on the ulnar border, extending from the pisiform bone two inches upward, and excised the cuneiform and os magnum and some spiculæ of bone. Patient transferred to V. R. C. April 1, 1865, and subsequently pensioned. Examiner A. L. Huffman, of Peabody, Kansas, reported: "Partial stiffness of wrist and stiffness of the two smaller fingers." Pensioner paid to December 4, 1875.——11. Pt. T. E. Hamilton, Co. A, 1st Maryland, aged 31 years, North Anna, May 21, 1864. Shot fracture of left carpus. Sent to Paterson Park, Baltimore. Caries ensued, and, August 2d, Acting Assistant Surgeon G. W. Fay excised the scaphoid, cuneiform, and trapezoid bones, and, August 10th, extracted another necrosed carpal bone that had become loose. August 5th, another operation was about to be practised, when the patient succumbed, as was supposed, from the effects of chloroform. The pathological specimen (FIG. 732) shows extended caries of the radius, carpals, and metacarpals. The excised carpals have been replaced in the preparation.——Two operations of this series, resulting in recovery with anchylosis, are of undetermined date: 12. Pt. W. H. Ekliff, Co. D, 2d Michigan, Williamsburg, May 5, 1862. Shot fracture of left wrist. Sent to Camden Street Hospital, Baltimore. Surgeon A. B. Hasson, U. S. A., reported: "Excision of some of carpal bones." Pensioned September 28, 1862. Re-enlisted in 1st Michigan Cavalry, and afterward in the 42d Infantry (V. R. C.). Surgeon J. Campbell, U. S. A., reported, September 21, 1867: "Anchylosis of the joint, destroying in a great degree the use of the hand." The pension record states that the joint is completely anchylosed; the fingers in a state of rigid atrophy: they cannot be closed on the palm of the hand. Pensioner paid September 4, 1875.——

FIG. 732.—Caries of the radio-carpal and carpal-metacarpal articulations after shot injury. *Spec.* 3204.

[1] STEVENS (G. T.). *On Excisions in Cases of Gunshot Wounds*, in *Transactions of the New York State Medical Society*, 1866, p. 140.

13. Pt. C. Kupferschmidt, Co. K, 2d Kentucky, aged 22 years, Stone River, December 31, 1862. Sent to Nashville. Discharged July 23, 1863, and pensioned. Examiner W. Owens, of Cincinnati, reported, September 19, 1866, that, "on account of a shot perforation of the right wrist excision of nearly the entire joint was performed." Name of the operator not remembered. The Cincinnati Examining Board reported, September 4, 1875: "Large firmly adherent cicatrices over lower fifth of forearm and carpus. Hand fixed in straight line with forearm laterally, inclined at angle of 45° with ulna. Nutrition of hand greatly impaired. Inability to flex fingers, other than very slightly, at second phalangeal articulations. * * * Great atrophy of hand." Pensioner paid September 4, 1875.

The eleven operations included in this category comprise removals of parts of the carpus and metacarpus, and, in some instances, one or more fingers:

Cases 2021–2031.—Five were primary cases, one resulting in consecutive amputation, and one, complicated by shot fracture of the femur, having a fatal termination: 1. Pt. J. W. Kneedler, Co. I, 81st Ohio, aged 20 years, accidentally, June 22, 1863. A tompion and musket ball passed through the palm of the right hand, at Pocahontas, Tennessee. Surgeon W. C. Jacobs, 81st Ohio, reported that the cuneiform, pisiform, and unciform bones were excised, and that the fourth and fifth metacarpals and little and ring fingers were removed. Surgeon J. H. Gove, U. S. V., reports this man's discharge from Benton Barracks, January 1, 1864, retaining only the thumb and index finger of the right hand, and having anchylosis of the wrist. Examiner W. H. Willson, of Greenfield, Ohio, reported, in 1873, that "the carpus is completely anchylosed. The functions of the thumb and index finger impaired."——2. Sergt. A. M. Massey, Battery F, 1st Rhode Island Artillery, aged 32 years, Goldsboro' Bridge, December 17, 1862. Shell comminution of right carpus and metacarpus. Surgeon G. A. Otis, 27th Massachusetts, reported that this man was holding a field glass when a shell fragment struck the glass, driving its fragments into the tissues and detaching the three outer fingers, and fracturing the terminal phalanx of the index finger. The shattered portions of bone were removed, viz: the pisiform, unciform, fourth and fifth metacarpals, distal extremity of third metacarpal, and the terminal phalanx of the index finger. The lacerated integument was trimmed with scissors to afford a good covering for the wound. Patient sent to New Berne. On the long march cold-water dressings were applied, but there was intense inflammatory reaction. Surgeon F. Gallonpe, 17th Massachusetts, reported abscesses formed in the wrist and elbow. Surgeon E. P. Morong, 2d Maryland, reported the patient's furlough from Foster Hospital February 28, 1863. He was commissioned second lieutenant V. R. C., and discharged June 23, 1867, and pensioned. Examiner J. W. Foye, of Boston, reported, June 24, 1868: "Anchylosis of the elbow and shoulder joints. The entire member is useless." Pensioner paid September 4, 1875.——3. Pt. H. Wiggins, Co. I, 20th Massachusetts, aged 31 years, near Fairfax Court House, February 24, 1863. Rifle musket ball perforated the left wrist. He was sent to Harewood Hospital, where Surgeon G. Antisell, U. S. V., reported: "The ball fractured the carpal bones and two middle metacarpal bones. The fractured bones were removed before he was admitted to this hospital, March 9, 1863. The day following his admission there was slight hæmorrhage. On March 11th, there was a second hæmorrhage, a pint of blood being lost before it was suppressed by the tourniquet. On March 12th, bleeding recurred to the extent of four ounces, when the wound was enlarged and the radial artery tied. March 21, 1863, the patient was doing well under a tonic treatment. The ligature had come away early, and bleeding had not recurred." Patient was transferred to Portsmouth Grove Hospital July 8th, and discharged December 29, 1863, Assistant Surgeon W. F. Cornick certifying that he was unfit for the Invalid Corps on account of gunshot wound of left wrist. He applied for pension, and Examiner G. S. Jones certified that the disability, arising from a gunshot wound in the left hand, received in the line of duty, was probably permanent; that the ball entered the dorsal surface between the third and fourth metacarpals, and emerged at the ulnar side of the carpus. There was a fistulous opening; the hand was badly swollen, and, with the forearm, was powerless and useless. Examiner J. W. Foye, of Boston, certified, March 6, 1869: "A gunshot entered the dorsum of the left hand at a point corresponding with the juncture of the scaphoid with the semilunar, and emerged at the inner side of the ulnar-cuneiform articulation. Subsequent inflammation has removed the first row of carpal bones, and the hand has become anchylosed."[1]——In the next case secondary amputation in the middle third of the upper arm was practised (Table LXXXVI, No. 21, p. 784): 4. Pt. J. W. Cary, Co. A, 87th Illinois, Pleasant Hills, April 8, 1864. Surgeon E. F. Sanger, U. S. V., reported: Musket-ball fracture of the right wrist, on account of which excision of the trapezium and trapezoid was practised on the field, with ablation of the second metacarpal and index finger. Sent to St. James Hospital, New Orleans. Intense inflammatory action involved the tissues of the forearm, and, May 15, 1864, Surgeon W. S. Webster, 95th Colored Troops, amputated at the middle of the upper arm. Pensioned June 16, 1864, and paid September 4, 1875.——5. Pt. *P. F. Bryant*, Co. G, 28th Tennessee, aged 25 years, near Marietta, June 18, 1864.[2] Surgeon C. B. Wilson, 28th Tennessee, on account of a shot injury of the wrist excised the trapezium and second metacarpal of the right hand. There was also a ball lodged in the right femur, and the health of the patient was bad when wounded. Surgeon E. A. Fleuellen reported examining this patient at Marietta, and removing a portion of the ball from the medullary canal of the right femur, comminuted near the trochanters. A Nélaton probe indicated the presence of another portion of the ball. On admission at Atlanta the patient was very feeble, and sank and died June 20, 1864.——There were two intermediary operations in this subdivision—one followed by consecutive amputation, the other by death: 6. Pt. *J. W. Hobbs*, Co. K, 27th Georgia, Antietam, September 17, 1862. Musket-ball perforation of right carpus. Sent to Hospital No. 5, Frederick.

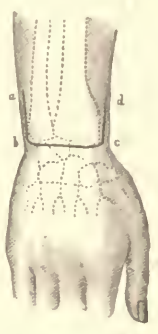

Fig. 733.—Velpeau's method for excision of the wrist joint by a quadrangular flap—*a, b, c, d*. [After Bernard and Huetie.]

[1] In this case Captain A. B. Holmes, 20th Massachusetts, of Nantucket, certifies that this soldier was wounded by a minié ball in the left hand and wrist while on fatigue duty on the Orange and Alexandria Railroad, February, 1863. Said ball was fired by a party of rebels, supposed to be Mosby's guerillas, and was received while Wiggins was engaged in said service and line of his duty. . . He was a first rate soldier, and faithful in the performance of his duty.

[2] O'Keefe (D. C.) (*Surgical Cases of interest treated at Institute Hospital, Atlanta, in May and June*, 1864, in *Confederate States Med. and Surg. Jour.*, 1865, Vol. II, p. 33) reports this case as No. 52 of the series in his report.

Assistant Surgeon P. Adolphus, U. S. A., October 17, 1862, performed a partial excision of the carpus, removing also a part of the fourth metacarpal. The specimen (FIG. 734), sent to the Museum, shows the greater portion of the bones and fragments removed. Surgeon H. S. Hewit, U. S. V., reported the patient improving December 29th, and transferred to Hospital No. 1. Sent to Provost Marshal February 9, 1863.—— 7. Pt. R. Walker, Co. F, 71st Pennsylvania, aged 26 years, White Oak Swamp, June 30, 1862. Sent to Union Chapel. Surgeon R. H. Coolidge, U. S. A., July 17, 1862, on account of a shot perforation of the left wrist, excised the unciform, os magnum, and trapezoid, together with the heads of the second and third metacarpals. It was found that a false aneurism of the radial artery had formed, and when the clots were turned out hæmorrhage occurred, which was suppressed with difficulty. Bleeding recurring, amputation of the forearm was performed, July 20, 1862 (TABLE CXXXVI, No. 31, p. 986). Patient died August 10, 1862.——There were three recoveries after secondary operations, in this subdivision: 8. Lieut. M. F. Ellsworth, Co. F, 97th Illinois, aged 26 years, Guntown, June 10, 1864. Shot comminution of fifth metacarpal of the right hand and of the ulnar side of carpus. Sent to Officers' Hospital, Memphis. Assistant Surgeon S. S. Jessop, U. S. V., December 12, 1864, excised the necrosed proximal end of the fifth metacarpal and the cuneiform, pisiform, and unciform bones through a V-shaped incision on the dorsum of the wrist. Sinuses that had burrowed in the hand and forearm were laid open. The wound was dressed with a dilute solution of permanganate of potassa. Did well, and went to modified duty January 20, 1865. Mustered out, and pensioned September 11, 1865. Examiner J. G. Davis, of Beatrice, Nebraska, reported, October 18, 1873: "Anchylosis of wrist joint: ring and little fingers permanently contracted. Pronation and supination of the forearm gone."——After the other two secondary excisions amputation in the forearm was eventually practised: 9. Pt. J. Milledge, Co. K, 33d Wisconsin, aged 26 years, near Orkney Station, December 22, 1862. Shot perforation of left carpus, with lesion of nerves. Sent to Harvey Hospital, Madison. April 2d, the parts being carious, Surgeon M. K. Taylor, U. S. V., excised the proximal ends of the first and second metacarpals, trapezius, trapezoid, and parts of scaphoid and magnum. Pensioned August 14, 1863. Wrist anchylosed; wound fistulous. Amputation of forearm (see TABLE CXXXVII, No. 139, p. 989) was performed June 21, 1864, by Surgeon H. Culbertson, U. S. V. (FIG. 735). Pensioner paid September 4, 1875.——10. Pt. C. W. Hastings, Co. E, 2d Sharpshooters, aged 21 years, Chancellorsville, May 2, 1863. Shot fracture of right wrist at junction of second metacarpal with carpus. Sent to Fairfax Seminary. June 23, 1863, Surgeon D. P. Smith, U. S. V., excised the os magnum, half of the trapezoid, and the second and third metacarpals. June 29th, there was bleeding to the extent of sixteen ounces from the deep palmar arch, and the brachial was ligated. Mortification set in, and the arm was amputated July 4, 1863. Pensioned October 9, 1863, and paid September 4, 1875.——There was one case in this category in which the interval between the injury and operation could not be ascertained: 11. Pt. P. Burns, Co. F, 69th New York, aged 29 years, Antietam, September 17, 1862. Sent to Hospital No. 5, Frederick. Surgeon H. S. Hewit, U. S. V., reported that a musket ball fractured the left wrist and inflicted a flesh wound in the left hypochondriac region. Caries of the carpus and metacarpus followed, and the fourth and fifth metacarpals and magnum, unciform, cuneiform, and pisiform bones were excised. Pensioned December 6, 1862. The New York Examining Board, July 3, 1862, reported: "The left ring finger is destroyed, and its metacarpo-phalangeal articulation. The little finger is crooked under the medius; the hand is not of much use" Pensioner paid September 11, 1865.

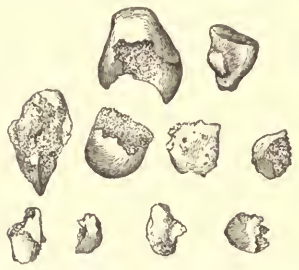

FIG. 734.—The semilunar, cuneiform, part of magnum, and other bones of left carpus. *Spec.* 437.

FIG. 735.—Bones of left forearm after partial excision and subsequent amputation. *Spec.* 3693.

Of the six complete excisions at the wrist, one proved fatal after recourse had been had to amputation in the forearm. The five others recovered with the functions of the hand much impaired, but, all things taken into consideration, in a better condition than if they had been subjected to amputation. Of the ninety partial excisions, one, in which the ends of the radius and ulna and two carpals were removed, terminated fatally after consecutive amputation in the upper arm.[1] Four patients who underwent excisions of the distal extremities of the radius and ulna recovered with considerable lateral distortion of the hand and stiffness of the fingers. Of twenty-six patients in whom the lower end of the radius was resected, two died, one after amputation in the upper arm; three submitted to amputation in the forearm. Of the twenty-one in whom the hand was preserved, nearly all recovered with anchylosis and extreme deformity. Generally the hand was strongly deflected to the radial side, often at right angles, the fingers rigidly fixed in flexion or extension, the end of the ulna projecting, and the integument over it irritable and exposed to accidental injuries; yet two of the men re-enlisted, and in several the deformed hand appears to have been preferable to any prothetic appendage. Of nineteen

[1] This case, No. 1942, p. 999, does not appear on the tables of amputations in the upper arm in this volume; because the operation was not performed in a hospital or reported to the Surgeon General, and was ascertained only when the result of the excision was traced at the Pension Office.

patients who underwent excision of the lower end of the ulna, three died, one was amputated above the elbow, and one in the forearm. Fourteen recovered, nearly all with anchylosis and deformity. The hand was generally less displaced than in the cases of the preceding category; but there was an equal proportion of cases of rigidity of the fingers, and more examples, comparatively, of paralysis and of neuralgic suffering. The six patients who submitted to excision of the end of the radius, with one or more carpals, recovered with anchylosis and deformity. Of ten excisions of the distal end of the ulna, with adjacent carpals or carpals and metacarpals, two were fatal. Of the eight patients who preserved at least a portion of the hand, one is an officer now in service, whose left wrist, thumb, and index finger are very useful; another recovered with a very useful hand, and the six others suffer from anchylosis, contracted fingers, and other deformities. Of the thirteen excisions confined to the carpus, four resulted in death, and one in amputation in the forearm. Of the eight patients whose hands were saved, three, one of whom was subsequently killed in action, retained valuable mobility of the hand, while in five there was anchylosis with much deformity. Two of the eleven excisions in the carpus with removal of one or more metacarpals were fatal, one after consecutive amputation in forearm; three others resulted in amputation, two in the upper arm and one in the forearm. The six patients in whom some portion of the hand was saved suffered from anchylosis. In one or two instances the elbow, and even the shoulder joints, were stiff; there was much deformity of the hand in almost every instance. In short, in sixty-eight of the ninety-six patients whose hands were preserved, at least in part, fifty-one had anchylosis at the wrist —five mobility with deformity, and three dangling-joints. Nine, of whom two are still in service, are reported to have had comparatively useful limbs. There were no such triumphs as were achieved in excisions at the shoulder, and, in less proportion, at the elbow; yet the mortality attending the excisions was not excessive, and the results in a few of the cases not altogether unsatisfactory. Those critical in classification might regard several of the operations as partial amputations of the hand, or as merely extractions of bone fragments, rather than formal excisions.[1] There was such a diversity in the operations that it is hardly practicable to deduce from them any general rules of surgical interference.[2]

[1] LOEFFLER (F.) (*General-Bericht*, . . 1867, S. 226) remarks: "The official report of the American civil war gives 34 'excisions of the wrist.' But the explanations prove that this expression is used very vaguely, as cases have been included in which the operation was confined to the removal of bone fragments." In *Circular* 6, S. G. O., 1865, describing the extent and nature of the materials accumulated in the Surgeon General's Office for a Medical and Surgical History of the War, I described, at page 54, the data in the register entitled "Excisions of the Wrist" as follows: "The 35 cases included in this catagory were all examples of partial excision. In 27, the ends of the radius or ulna, or of both, were removed, and in some instances shattered fragments of the upper row of carpal bones; in 8, the greater part of the carpal bones were excised." This was a true account of the returns examined at that date, and I cannot now perceive how I could have concisely described them with more careful discrimination. Now that I have come to discuss the materials, instead of merely indicating their nature and extent, it is proper that I should be held to strict definitions and exact classification, and I have accordingly termed these operations Excisions *at* the Wrist, instead of excision *of* the wrist, and have grouped them in subdivisions according to the portions of bone implicated. I think that I have just grounds for reiterated complaint that the professed preliminary review on the materials available for a surgical history should be incessantly referred to as in fact the official report of the surgery of the war. I am sure that the lamented and scrupulously accurate writer referred to would not have fallen into this mistake had he quoted from the original report of *Circular* 6, instead of the synopsis published in some of the Continental journals. Referring to this same paragraph in Circular No. 6, M. LEGOUEST (*Chirugie d'Armee*, 2ème éd., 1872, p. 572) remarks: "Peu pratiquée en Europe jusqu'à présent, la résection du poignet [pour les plaies?] par coups de feu a été faite 35 fois par les chirurgiens des Etats-Unis d'Amérique pendant la guerre de la sécession, et a donné 26 guérisons radicales. Si l'on entend par *guérison radicale* l'utilité du membre conservé, les résultats obtenus par les chirurgiens américains sont remarkablement satisfaisants." I used no such expression as *radical cure*, as italicized by M. LEGOUEST. I stated that: "Death took place once from pyæmia and twice from protracted suppuration and irritative fever. Twenty-six cases are reported as recovered. In 2 cases amputation of the forearm became necessary." It is added: "The reports are unsatisfactory in relation to the amount of mobility left in the hand." It would appear sufficiently plain that recovery was not meant to signify *radical cure*, or great utility in the retained limb.

[2] In his admirable article POIGNET (*Opérations*), in the *Dictionnaire de Médicine*, 1842, Vol. XXV, p. 342, VELPEAU says: "I know of but one example of resection of the wrist required by a fracture of the bones of the carpus or forearm from shot injury. It is that of BAGIEU (*Examen de plusieurs parties de la Chirurgie*, 1756, T. II, p. 440, *on* 7): The patient had the lower ends of both bones of the forearm shattered by a ball; numerous splinters were immediately extracted; an inch and a half shortening, at least, occurred, and anchylosis resulted. As the flexibility of the fingers was partly preserved, the patient could finally use the hand to write and draw almost as perfectly as before the injury. It is evident that analogous cases must have often been seen in any service and even in civil practice, and if they have not been detailed it is because surgeons have not thought them worthy of record as individual cases. Moreover, it would be impossible to trace from such observations any rule of therapeutics or of surgical interference."

Excisions at the Wrist in the Confederate Service.—On the register compiled by Dr. Howell L. Thomas, which furnished the valuable data on excisions at the shoulder and elbow in the Confederate service presented in the third and fifth sections of this Chapter, minutes are found of thirteen cases of excisions at the wrist for shot injury.[1] Unhappily the details of the cases are very meagre, and the precise results are almost uniformly left to conjecture. All of the patients are believed to have recovered from the excision without recourse to consecutive amputation; but a fair prospect of a useful hand is indicated in only one of the reports. There were five cases in which the operation consisted of removal of the articular extremity of the radius without interference with the first row of carpals:

Fig. 736.—Professor Esmarch's splint for excision at the wrist. [After MacCormac.]

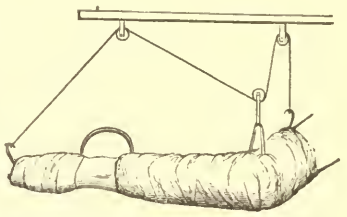

Fig. 737.—The splint applied. [After MacCormac.]

Cases 2032–2036.—Private *W. Boon*, Co. E, 3d Missouri, received, June 20, 1864, a comminuted shot fracture of the lower third of the left radius. Surgeon S. E. Chaille, P. A. C. S., of the Ocmulgee Hospital, Macon, reports that on June 22d the radius was exarticulated at the wrist and about six inches of the bone excised. The wound became gangrenous, and little hope was entertained of a useful hand.——Private *J. Faircloth*, Co. C, 45th Georgia, aged 22 years, was wounded June 22, 1864, at Petersburg. Surgeon J. J. Dement, of Thomas's Brigade, reported that a minié ball passed through the lower end of the radius, opening the joint, and that an inch and a half was excised on the field by Surgeon J. J. Wynne, 45th Georgia, on the same day. The patient was transferred to a general hospital.——Private *A. J. Hawes*, Co. E, 59th Alabama, aged 28 years, was wounded December 14, 1863. Surgeon R. B. Maury, of Greenville, Alabama, reported that a ball entered the left hand at the outer edge of the second metacarpal, passed upward, and traversed the trapezius, trapezoid, and scaphoid, and was arrested against the lower end of the radius, in the space between the tendons of the extensor secundus internodii pollicis and extensor ossis metacarpi pollicis, whence it was removed by a simple incision. Necrosis extending to the radius resulted, and a straight incision was made along the dorsum of the forearm and the lower two-thirds of the radius was excised. The health of the patient was bad; he had been subject to diarrhœa for a year. A full dose of brandy was administered before inducing anæsthesia by a mixture of equal parts of ether and chloroform. The anæsthetic was not well tolerated, the patient being much depressed. He improved greatly after the operation; his diarrhœa was checked, his appetite returned, the suppuration was moderate and laudable, the wound rapidly filled with healthy granulations, and, May 31, 1864, there was a good prospect of speedy recovery.——Private *T. Mull*, Co. G, 17th Mississippi, aged 19 years, received, at Gettysburg, July 2, 1863, a shot fracture of the carpal end of the left radius. Surgeon William A. Davis reported that the articular extremity of the bone was excised on the field.——Private *B. F. Stewart*, Co. F, 40th Mississippi, aged 27 years, was wounded July 20, 1864, a musket ball shattering the lower end of the right radius. Dr. H. R. Christmas, regimental surgeon, reported that the end of the radius was removed at the wrist joint, on the field, the same day, and that on August 27, 1864, the patient was doing well and was allowed to go home on furlough.

In the cases in which the after-treatment is adverted to, it is stated that the limb was placed semi-prone on a padded splint, and ice-water or ice dressings applied, followed by cataplasms when suppuration was established. The form of splint employed is not mentioned. Those of Professor Esmarch[2] (Figs. 736, 737) and of Professor Lister (Figs. 721, 722) are now most approved.

[1] Surgeon J. B. Read, P. A. C. S. (*Report on Wounds of Large Joints, made to the Confederate States Association of Navy and Army Surgeons*, printed in *Southern Med. and Surg. Jour.*, 1866, Vol. XXI, p. 206), treating of excisions at the wrist for shot injury, says: "We have ourselves no experience thus far, and find nothing in the surgical reports bearing on this subject." His further remark, that "cases of gunshot injury of the wrist joint requiring resection are of rare occurrence," is justly inferred from the absence of cases in the records consulted. He proceeds to say that "in the majority of cases the enlargement of the wound for the removal of shattered bone suffices, as for this purpose lateral incisions on the outer side of the bones may be made. Through these incisions the ends of either the radius or ulna may be turned out and cut off with the saw or bone pliers." This statement can only be accepted as hypothetical. On the dead subject it is not feasible to turn out readily the lower extremity of the radius through any reasonably large lateral incision; nor is it an easy task to divide the lower extremity of the radius, in an adult subject, with bone pliers. Surgeon J. J. Chisolm, P. A. C. S. (*Manual of Mil. Surg.*, Columbia, 3d ed., 1864, p. 387), quotes from Dr. H. Baer three successful excisions at the wrist derived from the records of the Confederate Surgeon General's Office, and remarks: "Instances of successful resections are recorded for injuries at the wrist joint, where the spiculated ends of both radius and ulna have been satisfactorily removed; also, instances in which either of these bones have been removed entire, for chronic cstitis and necrosis brought on from gunshot injuries." Although Dr. J. B. Read found nothing in the Confederate surgical reports bearing on this subject, Surgeon F. Sorrel, C. S. A., had published (*Confed. States Med. and Surg. Jour.*, 1864, Vol. I, p. 155) "the results of two successful primary and one successful secondary cases of excisions at the wrist," collected from the reports of the Confederate armies at the close of 1863.

[2] MacCormac (W.), *Notes and Recollections of an Ambulance Surgeon*, 1871, p. 104. Dr. MacCormac remarks that Professor Esmarch has treated resections of the wrist with great success, and that his excellent apparatus is a valuable adjunct in the after-treatment, being similar in principle and application to the American anterior suspensory fracture splints.

In one instance the lower end of the ulna, in another the end of the ulna and nearest carpals, in a third, the ends of both radius and ulna, with the scaphoid, were excised:

Cases 2037–2039.—Private *C. D. Martin*, Co. C, 45th Georgia, was wounded at Spottsylvania, May 12, 1864. Surgeon James J. Wynne, 45th Georgia, reported that a ball passed through the ulnar side of the wrist joint, comminuting the articular surface of the ulna. On the same day an inch and a half of the lower end of the ulna, including the styloid process, was resected through a straight incision on the outer border of the forearm. The patient was forwarded to general hospital on May 14, 1864.——Private *A. Q. McCann*, Co. F, 3d Alabama, was wounded December 13, 1862, at Fredericksburg. Dr. B. M. Terrill reported a gunshot wound in the wrist. A resection was performed the same day, of the lower end of the ulna, and the four contiguous carpal bones were extirpated. The patient was sent to general hospital.——Lieutenant *J. R. Smith*, of the 13th Arkansas, was wounded September 20, 1863, at Chickamauga. Surgeon W. T. Westmoreland, of Atlanta, reported that a ball, striking the hand, passed upward and implicated the wrist, on account of which a resection was performed of the carpal ends of the radius and ulna and the scaphoid bone was extirpated.

Five observations are returned vaguely as resections of the wrist or of the carpus:

Cases 2040–2044.—Private *J. Darley*, Co. H, 47th Georgia, aged 22 years, was wounded at Chickamauga, September 19, 1863, receiving a shot fracture of the lower jaw and a shot comminution of the right carpal joint. Surgeon D. A. Matthews reported that, on September 23d, the joint was resected through a straight dorsal incision four inches long, and that, at last accounts, the patient was doing well.——Private *William Lindy*, Co. I, 52d North Carolina, was wounded, August 21, 1864, by a musket ball penetrating the wrist. Surgeon Frank Foulkes reported that a resection of the wrist, involving chiefly the lower end of the radius, was performed on the day of injury. On September 1, 1864, the patient was doing well.——Private *J. L. Reed*, Co. I, 19th Arkansas, aged 24 years, was wounded, July 22, 1864, by a musket ball in the left wrist joint. Surgeon Frank Hawthorne, of the Academy Hospital, Forsythe, Georgia, reports that a resection of the carpus was done on the same day; that the patient recovered perfectly, and was furloughed in the month of August.——Corporal *A. C. Rhodes*, Co. C, 3d Arkansas, aged 19 years, was wounded, October 7, 1864, by a musket ball which shattered the left wrist. Surgeon D. W. Thomas, of St. Francis de Sales Hospital, reported that on the same day a resection of the wrist joint was done, and that on November 1, 1864, the patient was still under treatment in hospital and doing well.——Private *S. A. Story*, Co. K, 20th Mississippi, received a shot fracture of the wrist, July 28, 1864. Assistant Surgeon John R. Kirkland reported that on the same day a resection of the carpus was performed through a semilunar incision, and that the patient was sent to general hospital.

Eleven of the thirteen excisions were primary, one secondary, and one of undetermined date. Four were on the left, two on the right side, and in seven cases this point is not recorded. This series, added to the ninety-six cases of Table CXLII, which includes nine operations on Confederate soldiers, makes an aggregate of one hundred and nine excisions at the wrist for shot injury reported from the War, twenty-two in Confederate, and eighty-seven in Union soldiers, with a mortality rate of 13.7 per cent.

Concluding Observations on Excisions at the Wrist for Shot Injury.—The weight of evidence seems to indicate that although partial resections of the distal ends of the bones of the forearm injured by shot were practised by Bilguer and Bagieu, and possibly by others, in the middle and latter part of the eighteenth century, the first total excision of the wrist joint was that successfully performed about 1800, by the younger Moreau, in the case of a seamstress Agnes Bouchon. For the next sixty years the operation was repeated at rare intervals. Professors Fergusson, Erichsen, and Butcher brought about a sort of revival of the procedure in cases of caries in young subjects, but reported rather unfavorably as to its utility; and the general verdict of systematic writers was that the results were discouraging,[1] and that the operation[2] should only be performed under exceptional circum-

[1] Longmore (T.) (*Gunshot Wounds*, in *Holmes's System of Surgery*, 2d ed., 1870, Vol. II, p. 221) asserts that: "Gunshot wounds of the wrist joint are usually attended with so much injury to the superficial structures that it seems scarcely possible their treatment by resection can ever, under such circumstances, produce satisfactory results. . . As a secondary operation, after rare exceptional cases of gunshot wounds of the wrist in which the superficial structures have escaped, there is no reason why resection of the wrist should not be attended with the same excellent results that have attended the operation when performed for conditions of disease."

[2] In the Crimean War, Matthew (T. P.) (*Med. and Surg. Hist.*, Vol. II, p. 377) observes that "excisions of the wrist joint was not attempted, nor, indeed, would it seem to be an operation ever likely to be applicable in the majority of wounds seen in field practice. *Portions of the carpus* have, however, been removed with the adjacent parts of the metacarpus, in three cases during the second period of the war—one of these had a fatal termination." No reports of resections at the wrist in the Russian, French, or Sardinian armies have been published. M. Chenu records no examples of excisions at the wrist in the Italian War of 1859. In the reports of the Franco-German War of 1870-71, I have observed the following references: Langenbeck (B v.) (*Über eine von ihm wegen Schussverletzung ausgeführte Resection des Handgelenks*, in *Deutsche Militärärztl. Zeitschrift*, 1873, Jahrg. II, S. 259 and 263): two successful cases of excision at the wrist joint for shot injury, in soldiers of the 32d and 85th regiments. Beck (B.) (*Chir. der Schussverletzungen*, 1872, S. 591) cites two cases of excision at the wrist joint, one in a private of the 113th regiment, the other in a French soldier, and remarks: "Although the wounds have healed, as yet there is no use of the injured hand." Berthold (*Statistik der u. s. w. invalide gewordenen Mannschaften des 10 Armee-Corps*, in *Deutsche Mil.-ärzt. Zeitschr.*, 1872, B. I, S. 517) relates two cases of excision at the wrist joint in two soldiers of the 10th regiment. Both recovered with anchylosed wrists and immovable fingers.

stances. Little else could be expected with the methods of operation then practised. With the large longitudinal radial and ulnar incisions and ⊔-shaped flaps of Moreau (Figs. 720, 728), the dorsal quadrilateral flap of Velpeau, the H-shaped incisions of other operators, such injury was almost necessarily on the tendons, and frequently on the blood-vessels and nerves, as to preclude the possibility of conservation of much functional integrity in the hand. It cannot be claimed that the excisions at the wrist, done during the War by these rough methods, which have been figured here for warning rather than imitation, were to any extent encouraging. It remained for Professor Joseph Lister to devise, in 1864, an operative plan, which is as revolutionary in this branch of conservatism as his celebrated antiseptic method is likely to prove in the entire domain of operative surgery. It is altogether probable that, by strictly following Professor Lister's rules,[1] excisions of the wrist joint may be profitably practised in some cases of shot fractures and perforations of the carpus. The rules are detailed minutely, but without undue minuteness, in the foot-note. The form of splint employed in the after-treatment, and its application, are represented on page 1000 (Figs. 721, 722). The after-dressing is, of course, a matter of the utmost importance. A simple and excellent plan is presented by Professor Esmarch's suspensory splint (Figs. 736, 737). Dr. Hodgen's wire suspension splint (Fig.

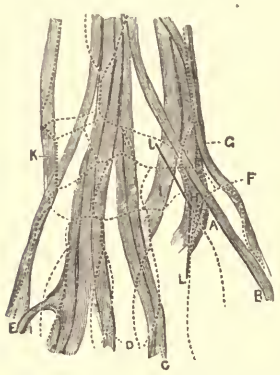

Fig. 738.—Topographical anatomy of the dorsum of the right wrist. [After J. Lister.] The parts are: *K*—ext. carpi ulnaris. *E*—ext. minimi digiti. *D*—extensor communis. *C*—indicator tendon of extensor communis. *I*—ext. carpi radialis brevior. *H*—ext. rad. longior. *B*—ext. secundi internodii pollicis. *G*—ext. ossis metacarpi pollicis. *F*—ext. primi internodii pollicis. *A*—radial artery. The deep line *LL*, indicates the incision.

[1] The directions of Professor Joseph Lister (*The Lancet*, 1865, Vol. I, p. 335) for complete excision of the wrist for *caries* are so excellent, and (as I have assured myself by following them on the cadaver) so applicable to extirpation of the carpus for injury, with or without removal of the ends of the radius, ulna, and proximal ends of the metacarpals, that I take the liberty of transcribing them here: "Chloroform having been administered, a tourniquet is placed upon the limb to prevent the oozing of blood, which would interfere with the careful scrutiny to which the bones must be subjected. . . The radial incision is then made in the situation indicated by the thick line in the accompanying diagram of the anatomy of the back of the hand (Fig. 738). This incision is planned so as to avoid the radial artery, and also the tendons of the extensor secundi internodii pollicis and indicator. It commences above at the middle of the dorsal aspect of the radius, on a level with the styloid process, this being as close to the angle where the tendons meet as it is safe to go. Thence it is at first directed toward the inner side of the metacarpo-phalangeal articulation of the thumb, running parallel in this course to the extensor secundi internodii; but on reaching the line of the radial border of the second metacarpal bone it is carried downward longitudinally for half the length of the bone, the radial artery being thus avoided, as it lies somewhat farther to the outer side of the limb. . . The soft parts of the radial side of the incision are next detached from the bones with the knife, guided by the thumb-nail, so as to divide the tendon of the extensor carpi radialis longior at its insertion into the base of the second metacarpal bone, and raise it along with that of the extensor carpi radialis brevior previously cut across, and the extensor internodii, while the radial artery is thrust somewhat outward. This prepares the way for the next step, which is the separation of the trapezium from the rest of the carpus by means of cutting forceps applied in a line with the longitudinal part of the incision—a procedure which, as experience shows, does not endanger the radial artery. The removal of the trapezium is reserved till the rest of the carpus has been taken away, when it can be dissected out without any considerable difficulty; whereas its intimate relations with the radial artery and its secure connections with neighboring parts would cause a great deal of trouble at an earlier stage of the operation. The soft parts on the ulnar side of the incision are now dissected up from the carpus as far as is convenient, the hand being bent back to relax the extensor tendons of the fingers. The separation of these is, however, best effected from the ulnar incision, which must be made very free. The knife is entered at least two inches above the end of the ulna, immediately anterior to the bone, and is carried downward between it and the flexor carpi ulnaris, and on in a straight line as far as to the middle of the fifth metacarpal bone at its palmar aspect. The dorsal lip of this incision is then raised and the tendon of the extensor carpi ulnaris is cut at its insertion into the fifth metacarpal bone, and is dissected up from its groove in the ulna, care being taken to avoid isolating it from the integuments, which would endanger its vitality. The extensors of the fingers are then readily separated from the carpus, and the dorsal and internal lateral ligaments of the wrist joint are divided; but the connections of the tendons with the radius are purposely left undisturbed. Attention is now directed to the palmar side of the incision. The anterior surface of the ulna is cleared by cutting toward the bone so as to avoid the artery and nerve; the articulation of the pisiform bone is opened, if that has not been already done in making the incision, and the flexor tendons are separated from the carpus, the hand being depressed to relax them. While this is being done the knife is arrested by the process of the uniform bone, which is clipped through at its base with pliers. Care is taken to avoid carrying the knife farther down the hand than the bases of the metacarpal bones; for this, besides inflicting unnecessary injury, would involve risk of cutting the deep palmar arch. . . The anterior ligament of the wrist joint is also divided, after which the junction between the carpus and metacarpus is severed with cutting pliers, and the carpus is extracted by seizing it from the ulnar incision with a serviceable pair of sequestrum forceps, and touching with the knife any ligamentous connections that may remain undivided. The hand being now forcibly everted, the articular ends of the radius and ulna will protrude at the ulnar incision. . . The ulna is divided obliquely with a small saw, . . and the end of the radius is then cleared sufficiently to permit [what is necessary] to be sawn off. . . My earlier cases, as well as some more recent ones to which I have not yet alluded, prove that a useful hand will result in spite of very extensive excision. The metacarpal bones of the fingers are next dealt with on the same principle, each being in its turn closely investigated; the second and third being most readily reached from the radial incision, the fourth and fifth from the ulnar side. If they seem sound the articular surfaces only are clipped off; the little facets by which they articulate with one another being removed by the longitudinal application of the pliers. . . The trapezium is next seized with a strong efficient pair of forceps and dissected out, so as to avoid cutting the tendon of the flexor carpi radialis, which is firmly bound into the groove on its palmar aspect, the knife being also kept close to the bone elsewhere to preserve the radial artery. The thumb being then pushed up longitudinally by an assistant, the articular end of its metacarpal bone is cleared and removed. This may seem a superfluity, as this bone articulates with the trapezium by a separate joint. But besides the possibility of its being affected through its immediate vicinity to the other articulations, the symmetry of the hand is promoted by reducing it to the same level as the other metacarpal bones. Lastly, the articular surface of the pisiform bone is clipped off; the rest of the bone being left, if sound, as it gives insertion to the flexor carpi

652, p. 904) would be equally satisfactory,[1] each of the latter apparatus admitting of the convenient employment of irrigation. With our present experience of excisions at the wrist for injury, it seems probable that recovery unattended by anchylosis is seldom to be anticipated, yet that this result is not disastrous, provided the hand is in good position, and the functions of the fingers are in some degree preserved. In a very few instances, loose, flail-like, pseudo-joints have been noticed, and Dr. Heyfelder has devised an apparatus (Fig. 739) designed to remedy, to some extent, this rare disability.[2] The most frequent deformity is anchylosis at the wrist with the hand in extreme adduction, or slightly deflected to the radial side. This appears to be irremediable by any apparatus, and suggests the propriety of always removing the carpal extremity of the ulna at the same level with the section of the radius whenever it is necessary to excise the distal extremity of the latter.[3] Rigid extension or flexion or else paralysis of the fingers are other frequent deformities resulting from the operation, for which Dr. E. D. Hudson has designed several ingenious forms of apparatus.

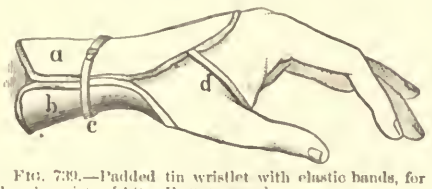

Fig. 739.—Padded tin wristlet with elastic bands, for dangle-wrist. [After Heyfelder.]

Prior to the War there was little experience in civil practice of excisions at the wrist.[4]

ulnaris and affords attachment to the anterior annular ligament, and may serve other useful purposes in the palm. But if there is any suspicion of its unsoundness it must be dissected out completely. The same applies to the process of the uniform. It may be observed that the extensors of the carpus are the only tendons divided; for the flexor carpi radialis is connected with the second metacarpal bone below its base and so escapes. But if it should be cut, there is no doubt that, like the extensors, it would acquire new and secure attachments. The tourniquet being now removed, it will probably be found that either no vessel at all requires ligature, or merely one or two superficial branches. The radial incision is stitched closely throughout, and also the ends of the ulnar incision, as it is desirable that union should take place there, and more especially over the end of the ulna; but the middle of this incision must be kept open by pieces of lint introduced lightly into the wound, to give support to the extensor tendons and to insure a wide opening into the cavity, which may serve for the free exit of the pus which must necessarily be found there. The limb is placed upon a splint (Fig. 721) and dressed with some porous material, arranged so as to avoid pressure upon the lines of incision, in order that it may absorb without obstructing the discharge. To the general reader the above description will, I fear, have proved wearisome; but to anyone about to perform the operation all the details will, I believe, be found well worthy of attention. The procedure consists, in fact, of a series of operations, each one of which must be executed with scrupulous care."

[1] Professor Esmarch, in his *Verbandplatz und Feldlazareth; Vorlesungen für Angehende Militairärzte*, Berlin, 1868, S. 68, figures a modification of his wrist splint, in which the limb, instead of being suspended, is supported on an adjustable inclined plane, covered by a wire cradle, to which the rubber tubes from irrigators can be conveniently attached.

[2] Heyfelder (O.), *Lehrbuch der Resectionen*, Wien, 1863, Fig. V. S. 267.

[3] Loeffler (F.) (*General-Bericht*, u. s. w., 1867, p. 218) records nine cases of shot fractures of the wrist joint, and has a good word to say in behalf of excisions at the wrist: "Without exception conservative expectant treatment was attempted. The results (3 fatal—1 after secondary amputation) bring up the question whether too much concession was not made to conservative ideas, and whether and how far conservative treatment in such cases is susceptible of improvement. Resection, which was such an important resource in shot injuries, was not employed among us in wrist-joint wounds." Langenbeck (B. v.) (*Chir. Beobachtungen*, 1874, S. 199) observes: "From my limited experience I fully agree with Loeffler regarding the severe shot wounds of the wrist. Shot fractures of the epiphyses of the bones of the forearm and of the carpus, or of extensive comminutions of the latter only, especially when the missile is lodged and cannot be removed in any otherwise, certainly indicate primary resection. In simple perforations of the wrist joint or the carpus I would at first proceed on the expectant plan, but would, without hesitation, have recourse to resection as soon as infiltration could not be controlled by incision and threatened to spread to the forearm. Resection during the period of infiltration offers here better chances for success, as the wrist joint is not covered with thick layers of muscles, and as the ichorous effusions can be completely evacuated through the incisions of the operation. Resection should have preference under these circumstances." At the meeting of the society of military surgeons at Orleans, February 8, 1871, Dr. Langenbeck gave the particulars of his cases of excisions at the wrist in the late war. He approved longitudinal incisions on the ulnar and radial sides, saving the arterio princeps pollicis, and regretted the impracticability of saving the extensor pollicis longus. Surgeon Gähde advocated the incision inside the extensor internodii ("through the *tabatière*") to save the long extensors. Langenbeck argued that this incision was liable to involve the nutritive artery of the thumb.

[4] In this country, apart from the operations of the War, excisions at the wrist have been little practised; although, latterly, examples are less infrequent. The following have been noted: Sayre (L. A.) (Blackman's Mott's Velpeau, 1856, Vol. II, p. 449), in December, 1853, is said to have performed a partial exsection of the carpus. Dr. Sayre "proposed to remove both rows of bones, but was dissuaded by the other surgeons of the institution, and to this circumstance he attributes his failure, amputation having been at length required." Toland (H. H.) (*On the Reproduction of the Bones*, in *Pacific Med. and Surg. Jour.*, 1858, Vol. —, p. 8) relates the case of J. Allen, shot through the wrist, in February, 1857; excision December 3, 1857, of the second metacarpal, half of the third, fourth, and fifth metacarpals, the trapezoid, magnum, uniform, and pisiform. At the date of the report "no doubt was entertained of saving the hand and restoring it to usefulness." Tewksbury (S. H.), *Case of Exsection of the Wrist Joint*, in *Trans. of the Am. Med. Assoc.*, 1865, Vol. XVI, p. 405. Cooper (E. S.) (*Case of Successful Removal of all the Carpal and parts of all the Metacarpal Bones*, in *Boston Med. and Surg. Jour.*, 1861, Vol. LXIV, p. 446): Excision for disease, in the case of a Scotchman, aged 30 years; good recovery. "Limb restored to a degree of usefulness almost equal to its condition prior to the disease." Walter (A. G.) (*Excision of the Wrist Joint*, in *Med. and Surg. Reporter*, 1867, Vol. XVI, p. 41): Case of J. Phillis, a boat-builder, aged 50 years; wrist excised for caries; recovery with some motion in hand and fingers. Livingston (A. T.), *Ten Cases of Excision of Joints, involving the Elbow, Wrist, Carpal, Phalangeal of Thumb, Hip, Knee, and Tarsal Articulations*, in *Buffalo Med. and Surg. Jour.*, 1873, Vol. XII, p. 285. Case of Claus von S——, aged 13 years, bones of wrist crushed; Dr. Miner excised the bones—recovery with useful hand. Hodge (H. L.), *Excision of Carpus and articular extremities of the Radius, Ulna, and the second and third Metacarpal Bones*, in *Phila. Med. Times*, 1874, p. 622 [For arthritis in the case of a man of 35]. Richardson (T. G.) (*Resection of the Wrist Joint*, in *New Orleans Med. and Surg. Jour.*, 1874–'75, Vol. II, p. 819): Case of J. H., aged 35 years, chronic disease of left wrist—recovery, but result of operation as to usefulness of hand not stated. Logan (S.) (*Case of Resection of Wrist Joint*, in *New Orleans Med. and Surg. Jour.*, 1875, Vol. III, p. 175): Case of C. E. A., aged 26 years, resection for chronic arthritis—fatal.

In a case of caries following shot perforation of the carpus, Dr. Toland, of San Francisco, in 1857 unsuccessfully attempted a partial excision, being compelled to have recourse to subsequent amputation.[1] There was knowledge of Moreau's and the Crimean cases, and of a few resections of the protruding extremities of the radius and ulna in cases of compound luxation. In their report of Excision of Joints for traumatic cause, these data were

[1] The literature of excisions at the wrist, though for the most part recent, is already quite extensive. Apart from the allusions to the subject in systematic works, the following references may be noted. They are arranged in chronological order: As of historic interest the operation of COOPER, of Bungay, in 1758, mentioned in the *Cases and Practical Remarks in Surgery* of BENJAMIN GOOCH, must be recalled. In a case of compound luxation at the wrist, "*in a young subject*," COOPER sawed off the lower end of the radius, which had perforated and dismally lacerated the tendons at the wrist. In the edition of 1792 of GOOCH'S *Chirurgical Works*, this operation is referred to in Vol. II, at p. 319, and it is stated that the patient recovered "with little or no defect in the strength or motion of the joint." British surgeons commonly refer to this as the earliest approach to excision at the wrist joint; but BAGIEU'S case of the removal of the lower ends of the radius and ulna comminuted by shot, in a soldier aged 25, was published in his *Examen* (T. II, Obs. VII, p. 440) in 1756, and probably antedates the operation of COOPER. The case of removal of three inches of the diseased lower part of the ulna by DANIEL ORRED, of Chester, "in a young man of the name of *Moores*, about sixteen years of age," near the year 1772, is printed in the *Philosophical Transactions of the Royal Society*, 1779, Vol. LXIX, p. 10. PERCIVALL, who communicates the case, remarks that "a callus at a proper time formed in the intermediate space," whence it may be inferred that the excision was in the continuity of the bone. J. N. BILGUER (*Chirurg. Wahrnehmungen*, 1763, S. 445) reports that: "In the case of Kilian, wounded October 28, 1762, the ends of the radius and ulna, of the wrist and metacarpus, were shattered by a howitzer shot. Stabsarzt BEYER extracted numerous large fragments, some at the time of the injury, some later. The patient recovered in four months." Dr. O. HEYFELDER reckons this a case of formal excision; but Dr. F. A. HÖRING, who has written a careful inaugural dissertation on this subject (*Die Resektionen im Handgelenk*, Tübingen, 1861, S. 22), very properly excludes it from such a category. BILGUER adduces, however, another case, which seems to have been little noticed, though more to the point. He states (*op. cit.*, p. 540) that Staff Surgeon BIRNBAUM, in the case of Voigt, a hussar of the regiment Kleist, shot through the wrist joint at Passberg, in 1759, made several incisions and excised (schälte ab) several larger and smaller pieces of bone; and that the patient recovered in eight months. Dr. HODGES states (*The Excision of Joints*, 1861, p. 74) that in July, 1794, the elder MOREAU excised the wrist for acute necrosis, in a man of 71; the case terminated fatally. I have been unable to verify this citation. The library of the Surgeon General's Office does not possess a copy of P. F. MOREAU'S *Observations pratiques relatives à la résection des articulations affectée de carie*, Paris, 1803; but in KRAUSE'S German translation of the work it is stated, at page 116: "Resection may be performed also at the wrist joint; I have performed it a long time ago, for caries of the lower end of the radius. The subject was Agnes Bouchon, a seamstress of Trevay; the result was favorable . . . I am in possession of positive information that she recovered the mobility of the fingers and even the hand, enabling her to resume her former occupation." PERCY and LAURENT, in the article *Résection*, in the *Dict. des Sci. Méd.*, T. LXVII, 1820, p. 550, refer to this case of the younger MOREAU as the "seul example de résection sur cette articulation" known to them. CHAMPION (*De la résect.*, etc., *op. cit.*, 1815, p. 56) mentions that he witnessed this operation. See also JEFFRAY'S PARK and MOREAU, 1806, p. 157. Two excisions of the lower ends of the radius and ulna, in cases of compound luxation, by SAINT-HILAIRE and HUBLIER, have been quoted as excisions at the wrist. I have cited them in a note on page 934, as probably operations in the continuity. Later references may be briefly noted: VERBEECK (*Bull. de l'acad. roy. de méd. de Belg.*, 1844, T. III, No. 1, p. 29) resected, about 1823, the lower end of the radius, in a boy of 14, who recovered, and entered military service. JAEGER (M. F. RIED, *Die Resectionen der Knochen*, Nürnberg, 1860, S. 353), in 1834, resected 2 inches of the ulna for shot injury, in a man aged 48; amputation 10 days later—fatal. ROUX (P. J.) (*Lancette Francaise*, 1830, No. 58), in the case of widow Bonnal, aged 42, with caries, resected, May 29, 1830, the lower ends of the radius and ulna. In a second case (GERDY, *De la résect. des ext. art. des os*, 1839, p. 43), ROUX resected the lower end of the radius, but the patient died. RICORD (*Gaz. Méd. de Paris*, 1842, p. 603), [The lower end of the radius resected in a laborer, aged 23 years. Recovery with slight inclination to radial side.] ADELMANN (*Decapitation der Ulna und des Radius am Handgelenke*, in *Arch. für physiol. Heilkunde*, Stuttgart, 1846, p. 416) cites 18 cases of excision at the wrist. ROEDER, *Ueber die Resectionen am Knochengerüste der Hand*, Würzburg, 1847. HESS (W.), *Ueber die Resection der Handgelenke*, Würzburg, 1849. MUELLER (E. T.), *De resectione ossium carpi et metacarpi*, Misniæ, 1852. MAISONNEUVE, *Résection du poignet*, in *Gaz. des Hôp.*, Paris, 1853, p. 280. BOUSTEDT (A.), *De resectione articuli manus*, Dorpat, 1854. ERICHSEN (J. E.) (*Excision of the Wrist Joint*, in *Lancet*, 1854, Vol. I, p. 63), case of Ann M., aged 28 years; caries of right wrist; first row of carpals removed; and (*Med. Times and Gaz.*, 1860, Vol. I, p. 366) case of ———, aged 34 years; removal of lower ends of radius and ulna, carpal bones, and carpal ends of metacarpals. FERGUSSON (W.) (*Excision of the Wrist*, in *Lancet*, 1842–'43, Vol. II, p. 856), in 1842, successfully excised the lower end of the ulna in a patient aged 23 years, for caries; he repeated the operation in 1851 and 1853 (*Lancet*, 1854, I, p. 99), cases of G. G., aged 22 years, complete excision; and George M., aged 28 years, removal of greater number of carpals; also in 1857 (*Med. Times and Gaz.*, 1857, I, p. 140), woman, aged 31 years, caries; several carpal bones removed; not promising. SIMON (J.) (*Excision of the Wrist Joint*, in *Lancet*, 1854, I, p. 100), case of John L——, aged 19 years; all bones of carpus except pisiform and trapezium; result not encouraging. STANLEY (E.) (*Lancet*, March 17, 1855, p. 288), boy, aged 13 years; removal of carpals save the trapezium. BUTCHER (R. G. H.) (*On Excision of Joints*, in the *Dublin Quart. Jour.*, November 1, 1855, Vol. XX, p. 268), case of E. R., aged 58 years; excision of carpals save the trapezium. FEARN (*Excision of Joints*, in *Med. Times and Gaz.*, 1857, I, p. 288), woman, aged 28 years; excision of extremity of the ulna and four carpals for caries. HÖRING (C. F. A.) (*Die Resection in Handgelenk*, Tübingen, 1861), on page 38 of his very careful bibliographical summary, cites a case of excision of the entire wrist joint, by Prof. v. BRUNS, performed in 1860, for disease—patient recovered. CHASSAIGNAC (E.) (*Traité clin. et prat. des op. chirurg.*, 1861, p. 631), [blundering as usual, declares: "En fait de résection réelle de la totalité du poignet, il n'existe qu'un exemple de cette opération, etc."]. SIEBOLD (F.), *De resectione articuli manus*, Berolini, 1862. DANZEL, *Zur Resection des Handgelenkes*, in *Archiv für Klin. Chir.*, Berlin, 1862, B. II, S. 512 [details the various modes of operating, etc.]. ROTH (F. R.), *Ueber die totale Resection des Handgelenkes*, Jena, 1863. Wochenschrift*, 1874, p. 87.

considered by the surgical advisory committee of the Sanitary Commission to afford "precedents sufficient, perhaps, to authorize renewed trials in cases not accompanied by too great laceration of the soft parts" by shot projectiles. The trials have been made; but the question whether the wrist joint, from its complexity, is altogether unfitted for the favorable performance of excision for injury, is still not fully elucidated.

AMPUTATIONS AT THE WRIST FOR SHOT INJURY.—Sixty-eight of these operations were reported as practised on sixty-seven patients. One patient had both hands disarticulated at the wrist. Of the sixty-six patients whose ulterior histories were traced, seven died, or 10.6 per cent.

TABLE CXLIII.

Summary of Sixty-eight Amputations at the Wrist Joint for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Allison, J. F., Serg't, H, 15th Ill., age 23.	Oct. 5, 5, '62.	Left; flap; by A. A. Surg. J. Van Valsey. To V. R. C.; pensioned.
2	Ancona, J. D., Pt., I, 6th N. Y. Battery.	Oct. 19, 19, '64.	Right. To V. R. C.; pensioned March 31, 1865.
3	Brennan, F. H., Serg't, B, 185th N. Y., age 30.	Mar. 29, 29, '65.	Right; April, amp. forearm. Pensioned June 27, '65. Died April 14, 1871, typhoid pneumonia.
4	Buck, J., Pt., E, 70th N. Y., age 20.	May 5, 5, '62.	Right. Disch'd July 3, 1862; pensioned; good stump.
5	Burke, R., Pt., G, 8th C. T., age 30.	Sept. 29, 29, '64.	Right; flap; by Surg. C. P. Heichbold. Pens'd June 4, '65.
6	Busher, J., Pt., D, 1st Ohio, age 22.	Nov. 25, 25, '63.	Right; flap; by A. Surg. R. G. Stevenson. Pens'd Sept. 20, 64.
7	Butterworth, J., Pt., F, 1st R. I. Art., age 21.	Dec. 16, 16, '62.	Left; circular; amp. forearm. Pens'd Sept. 17, '64. *Spec.* 1329.
8	Campbell, J., Pt., I, 21st Indiana, age 19.	Aug. 17, 17, '61.	Left; flap; by A. Surg. W. R. Ramsey. Pens'd Nov. 1, 1861.
9	Crawford, J. L., Serg't, G, 85th Ind., age 19.	Oct. 18, 18, '62.	Left; by Surg. J. S. Elliott, 86th Ind. Pens'd January 29, 1863.
10	Daily, H. A., Pt., B, 8th Wisconsin, age 31.	June 6, 6, '64.	Right; by Surg. E. Murta, 8th Wis. Disch'd June 9, '65; pens'd.
11	Donaldson, S., Corp'l, G, 10th Ill., age 31.	June 28, 28, '64.	Left; flap; by Surg. H. R. Payne, 10th Ill. Pens'd Oct. 20, 1864.
12	Dunn, J. C., Pt., A, 1st Me. H. Art., age 20.	June 28, 28, '64.	Right; flap. To V. R. C. Nov. 20, 1864. Not a pensioner.
13	Foster, E. R., Pt., L, 9th Ill. Cavalry, age 24.	Jan. 2, 2, '63.	Left; flap; by Surg. J. W. Brackett. Pensioned Feb. 21, 1863.
14	Gaus, G., Serg't, D, 36th Wisconsin, age 23.	June 18, 18, '64.	Right; flap; by Surg. N. Hayward. Dis'd June 17, '65; pens'd.
15	George, J., Pt., C, 6th Maine, age 39.	May 10, 10, '64.	Right; by Surg. W. Morrison. 14th N. C. Pens'd Nov 23, 1864.
16	Gross, J., Pt., D, 11th Missouri, age 22.	Mar. 27, 27, '65.	Left; by Surg. V. B. Kennedy (removal of part of scapula). Pensioned June 29, 1865.
17	*Hanberry, J.*, Pt., I, 5th South Carolina.	May 24, 26, '64.	Left; circular; by Surg. C. B. Gibson, C. S. A. Recovery.
18	Hatch, J. O., Pt., G, 6th Wisconsin, age 26.	Aug. 4, 4, '61.	Right; ant.-post flap; by Surg. H. McKennan. Pensioned. Died June 28, 1869.
19	Hudson, J., Pt., I, 130th Indiana, age 21.	June 15, 15, '64.	Left. Discharged Jan. 10, 1865. Dropped from Pension Rolls.
20	Hutchins, M. F., Serg't, I, 12th N. H., age 25.	Nov. 7, 7, '62.	Left; flap; by Surg. H. B. Fowler, 12th N. H. Pen'd Dec. 10, '62.
21	Keefer, D., Pt., C, 7th Pa. Res., age 31.	Sept. 17, 19, '62.	Right; circular. Discharged Oct. 30, 1862; pensioned.
22	King, E. F., Pt., C, 10th Connecticut, age 18.	Dec. 14, 14, '62	Right; circ.; by Surg. I. F. Gallaupe. Pens'd Dec. 31, 1864.
23	Kipping, W., Pt., E, 3d Artillery.	July 18, 18, '63.	Right; by Surg. J. L. Mulford. Pens'd August 27, 1863. Died Aug. 18, 1869.
24	McDonald, J., Pt., G, 85th Pa., age 29.	July 29, 29, '63.	Left; circ.; amp. right arm; Surg. S. A. Green. Pen'd Mar. 7, '64.
25	McGrane, H. J., Pt., D, 164th N. Y., age 23.	May 19, 19, '64.	Left; flap; by Surg. M. Rizer. Pensioned Nov. 28, 1864.
26	McKinney, G., Corp'l, B, 128th Pa.	Sept. 17, 17, '62.	Right; circ.; poor stump. Pens'd Nov. 20, '62. Died Sept. 30, '68.
27	Magoonaugh, B., Pt., Ord. Corps, age 23.	May 4, 4, '65.	Left; amp. right forearm; by A. A. Surg. E. S. Snow. Pensioned March 17, 1868.
28	Mann, W. H., Pt., C, 118th Ohio, age 31.	July 22, 22, '64.	Left; Surg. A. M. Wilder; hæm.; ligation. Pens'd April 8, 1865.
29	Matthewson, C. B., Pt., K, 21st N. Y.	Oct. 10, 10, '61.	Left; flap. Disch'd Nov. 11, '61; pens'd. Died March 28, 1868.
30	Maxfield, J. T., Pt., B, 65th Indiana, age 24.	Dec. 28, 28, '62.	Right; circular. Disch'd Sept. 9, 1863; pensioned.
31	Mayans, J., Pt., I, 37th Mass., age 30.	May 9, 9, '64.	Left; flap. Discharged Dec. 7, 1861; pensioned.
32	Miller, C. W., Pt., F, 9th Pa. Res., age 22.	June 27, 27, '62.	Left; by Surg. J. A. Phillips, 9th Pa. Res. Pens'd Sept. 6, 1862.
33	Moody, W., Pt., I, 121st Pa., age 25.	Dec. 13, 13, '62.	Right; circ.; by Surg. C. Bower, 6th Pa. Res. Pens'd May 19, '63.
34	Moran, E., Pt., D, 67th New York, age 21.	Sept. 27, 29, '61.	Left; flap; by A. Surg. J. R. Smith. Pens'd March 6, 1862.
35	Moses, H. F., Pt., B, 39th Mass., age 19.	May 10, 10, '64.	Left; double flap; by Surg. W. Thorndike; amp. forearm Jan. 7, '65; pen'd Mar. 19, '65. *Spec.* 4197.
36	Mosher, V. B., Pt., F, 57th N. Y., age 21.	May 10, 10, '64.	Left; circular; by Surg. W. B. Chambers. Pens'd Jan. 10, 1865.
37	Peck, C. S., Pt., D, 64th N. Y., age 19.	April 7, 7, '65.	Right; circ.; Surg. M. C. Rowland. Pens'd June 8, 1865.
38	Randall, H., Pt., C, 8th Connecticut, age 20.	May 16, 16, '64.	Right; flap. Discharged March 30, 1865; pensioned.
39	Reedy, S., Pt., F, 93d Indiana, age 25.	Dec. 16, 16, '64.	Right; flap. Discharged April 17, 1865; pensioned.
40	*Revels, T.*, Pt., F, 23d South Carolina, age 19.	July 15, 16, '64.	Left; circular. Discharged February 20, 1865.
41	Schook, J., Pt., K, 15th Indiana, age 22.	Dec. 31. 31, '62	Left; flap. Discharged April 7, 1865; pensioned.
42	Seivers, H., Pt., A, 14th Iowa, age 26.	May 11, 12, '63.	Left; circ; by Surg. G. M. Staples. Pensioned July 13, 1863.
43	Skelly, E., Pt., F, 2d N. Y. H. A., age 28.	June 22, 22, '64.	Left; circular; by Surg. G. L. Potter. Pensioned Jan. 24, '65.
44	*Stroup, D.*, Pt., H, 18th Georgia, age 19.	Aug. 30, —, '62.	Right. Furloughed October 4, 1862."
45	Thompson, T. M., Pt., 1st Me. Bat., age 43.	Jan. 14, 14, '63.	Right; amp. left forearm; Surg. M. D. Benedict. Pen. May 12, '63.
46	Thorne, E. M., Pt., C, 2d Conn. H. A., age 20.	Oct. 19, 20, '64.	Right; circular. Discharged June 5, 1865; pensioned.
47	Tucker, S., Mus'n, K, 87th Illinois, age 19.	May 21, 21, '63.	Left; by Surg. E. L. Stewart. Disch'd June 19, 1861; pens'd.
48	Warren, M. C., Mus., A, 26th Me., age 17.	May 5, 5, '63.	Both. Discharged Jan. 26, 1865; pens'd. Died Feb. 3, 1875.
49			
50	Wood, M. T., Pt., K, 130th Ind., age 18.	June 17, 17, '64.	Left; circ.; by Surg. C. D. Moore. Pens'd Jan. 3, 1865; amp arm.
51	Blasland, G. B., Pt., D, 1st Mass., age 30.	Aug 29, Se 25, '62.	Left; flap; by A. A. Surg. J. W. Digby. Pens'd Feb. 25, 1863.
52	Day, H. H., Pt., D, 96th N. Y., age 24.	Oct. 29, No. 9, '64.	Right; Nov. 14th, hæm.; amp. arm. Pens'd July 25, 1865.
53	Dye, S., Pt., C, 58th Indiana, age 23.	De. 31, '62 Ja. 10, '63.	Left; by Surg. T. Seymour, U. S. V. Disch'd April 8, '63; pensioned.
54	Hammel, H., Pt., C, 10th Indiana, age 26.	Jan. 19, 26, '62.	Left; Surg. S. L. Burdett (amp. fingers). Pens'd Feb. 21, 1862.
55	Harrington, T., Pt., B, 34th Wis., age 31.	Feb. 18, 28, '63.	Left; flap; by Surg. J. E. Weinem. Pensioned May 20, 1863.
56	Ketchum, D. F., Pt., A, 23d Michigan, age 43.	Sept. 20, Oct. 5, '63.	Right; flap. Disch'd Dec. 16, 1863; pens'd. Died Apr. 17, '71.
57	Tousher, J., Pt., A, 72d N. Y., age 34.	July 1, Se. 10, '62.	Right; A. A. Surg. W. F. Atlee (amp. thumb). Pen. Dec. 15 '62.
58	Thoma, C., Pt., G, 3d Infantry, age 29.	Jul. 21, '61 Sept. '64.	Left; flap. Pensioned October 20, 1861.
59	Tyler, H. R., Pt., C, 60th Illinois, age 27.	May 15, Oc. 10, '64.	Right; by Surg. M. Goldsmith. Disch'd Feb. 10, 1865; pens'd.
60	Verrille, J., Pt., C, 3d N. H., age 45.	May 13, June 16, 1864.	Right; flap; by A. A. Surg. W. P. Moon (erysipelas). Pens'd Sept. 27, 1864. *Spec.* 3622.
61	Heyman, H., Pt., D, 53d Pa., age 20.	June 16, 16, '64.	Right; by Surg. P. E. Hubon, 28th Mass. Died June 25, 1864.
62	Macathin, J., Pt., I, 12th C. T., age 20.	Dec. 16, 16, '64.	Left; by A. A. Surg. J. S. Giltner. Died Dec. 19, '64, tetanus.
63	Osborne, W., Corp'l, H, 54th Ohio.	July 22, 22, 64.	Right; by Surg I. N. Barnes, 116th Ill. Died Aug. 28, 1864.
64	*Pippin, R. R.*, Pt., K, 47th Ala., age 25.	Aug. 16, 17, '64.	Right. Died August 19, 1864.
65	Stanford, V. B., Pt., A, 1st Ohio L't Art.	May 15, 15, '64.	Left (amp. right arm); Surg. E. B. Glick, 40th Ind. Died June 4, '64.
66	Henderson, J. H., Pt., D, 14th Connecticut.	Sept. 17, 28, '62.	Left; circular. Died September 30, 1862, tetanus. *Spec.* 135.
67	Thompson, J. C., Pt., B, 17th Pa. Cav., age 43.	June 12, Jul. 15, '64	Left; by A. A. Surg. M. K. Knorr; Sept. 20, re-amp arm. Died Oct. 17, 1864, pyæmia. *Spec.* 3674.
68	*Thompson, T.*, Pt., I, 6th Georgia.	Sept. 17, 1862.	Right.

Fifty-five of the foregoing operations were primary disarticulations at the wrist, performed on fifty-four patients, with five deaths, or 9.2 per cent. Seven cases with one death, or 14.3 per cent., were intermediary disarticulations. The fatal result was due to tetanus. Five operations, of which one proved fatal, were secondary. One case was undetermined as to the period of the operation, or the result. Thirty-two of the amputations were on the right, and thirty-six on the left side. Of the seven fatal cases, four were on the left and three on the right side. Consecutive amputation in the continuity was resorted to in five instances, twice successfully in the forearm, thrice, with one fatal result, in the upper arm. A few further remarks on shot fractures,[1, 2] excisions,[3, 4] and amputations[5, 6] at the wrist are adduced in the notes.[7]

[1] H. L. LEDRAN, ever inclined to conservatism, taught (*Traité ou Reflexions tirées de la Pratique sur les Playes d'Armes à feu*, 1737, p. 213) that: "Shot wounds at the wrist are ordinarily attended by fracture—that is, one of the bones forming the articulation, or many of them, may be splintered, crushed, or even carried away, and that cannot take place without the ligaments and aponeuroses that bind them together being much injured, and the tendons passing over them divided and torn. . . . By incisions and counter-openings, by regimen, blood-letting, and topical applications, we may prevent the ligaments and capsules that unite the wrist with the forearm participating in the inflammation, breaking down, and disorganization of the lacerated tendinous parts. With these precautions we commonly see such wounds heal quite readily."

[2] Dr. T. P. MATTHEW (*Hist. of Wounds and Injuries*, Part II of *Med. and Surg. History of the British Army which served . . . in the Crimea*, 1858, p. 351) states that: "Wounds of the wrist joint have been returned under the head of injury to the carpus," a statement copied, of course, by Dr. G. H. B. MCLEOD (*Notes, etc.*, 1858, p. 430); but both editors seem to have overlooked the fact that the only return of injuries to the wrist joint made confounds the penetrating and perforating wounds of the carpus and metacarpus, so that it is impossible to distinguish what proportion involved the wrist. As there was but one death in 113 cases, it is probable that most of the injuries were confined to the metacarpis without involving the proximal articular ends. On pp. 372–3, Dr. MATTHEW mentions one wrist joint amputation in the Crimea, and three at the hospitals on the Bosphorus, all four operations resulting successfully. Dr. GEORGE WILLIAMSON (*Mil. Surg.*, 1863, p. 131) remarks that the number of men invalided for wounds of the carpus and metacarpus in the British army "is usually great, which shows their severity."

[3] HAMILTON (F. H.) (*The Principles and Practice of Surgery*, 1872, p. 888) remarks: "Excisions of the lower end of the radius alone, when not accompanied with a fracture and shortening of the ulna, invariably result in more or less deflection of the hand to the radial side. I have seen it turned in this direction to nearly a right angle. If, therefore, excision of the lower end of the radius is practised, and the ulna is not broken and overlapped, it will be advisable to remove at the same time an equal portion of the lower end of the ulna. In the single case in which I have adopted this practice, the subsequent inflammation and suppuration were moderate, the hand was restored, occupying its normal position, with good motion at the wrist joint and a useful amount of motion in the fingers. The great value of a thorough excision of both bones in this class of cases, as a means of insuring complete relaxation of the muscles and of preventing subsequent inflammation, will be found fully explained and illustrated by cases in my treatise on *Fractures and Dislocations*, in the chapter entitled '*Compound Dislocations of the Long Bones*.'"

[4] ESMARCH (F.) (*Ueber Resectionen*, 1851, S. 37): "If the attendant circumstances are favorable, injuries of the wrist and ankle joints heal under proper treatment, though after long suffering, and with anchylosis. Amputation of the limb appears to be indicated only by extensive comminution of bone. We did not, however, perform resection at the wrist, because, on the one hand, on account of the numerous tendons, vessels, and nerves around the parts, and, on the other hand, because they scarcely promise a better result than is attainable by free well-directed openings of the joint capsules."

[5] Sir CHARLES BELL (*A System of Operative Surgery*, 1814, Vol. II. p. 492) remarks: "I have seen the arm amputated for a ball through the wrist joint; but so I have for a ball through the small head of the ulna, and in both instances the operation was altogether improper. The excess of fungus which is thrown out from such wounds, with shattered bones, betrayed the surgeon into a belief that the hand should be amputated."

[6] In European surgical annals for the last half century, the following references to amputations at the wrist for shot injury may be found: LARREY (H.) (*Hist. chir. siège de la citadelle d'Anvers*, 1833, p. 304) reports two cases of amputations at the wrist: one proved fatal. STROMEYER (L.) (*Maximen*, u. s. w., S. 756) reports two cases of exarticulation of the wrist; one was fatal. MATTHEW (T. P.) (*Hist. of Wounds and Inj.*, Part II. *Med. and Surg. History of the British Army*. . . . in the Crimea, 1858, p. 372–3) tabulates three successful amputations at the wrist joint. CHENU (J. C.) (*Rapport*, etc., *pendant la campagne d'Orient*, 1865, p. 655) tabulates sixty-eight amputations at the wrist, with twenty-seven deaths. CHENU (J. C.) (*Statistique*, etc., *de la campagne d'Italie*, 1869, T. II, p. 641) gives thirteen amputations at the wrist, with six deaths. DEMME (H.) (*Mil. Chir. Studien*, 1861, B. II, S. 241) tabulates twelve cases of enucleation of the hand; five proved fatal. LŒFFLER (F.) (*General-Bericht*, 1867, S. 301) tabulates one successful case of exarticulation at the wrist. BIEFEL (R.) (*Im Reserve-Lazareth Kriegschir. Aphorismen von* 1866, in LANGENBECK'S *Archiv.*, 1869, B. XI, S. 475) tabulates three successful exarticulations at the wrist. BÉRENGER FÉRAUD (*Étude sur les blessures du poignet traitées dans la deuxième division des blessés du Val-de-Grâce*, in *Bulletin gén. de Thérapeut. méd. et chir.*, 1872, T. 82, p. 302) cites one successful case of exarticulation at the wrist joint. ARNAUD (GRELLOIS E.) (*Hist. méd. du blocus de Metz*, 1872, S. 353) tabulates three successful cases of amputations at the wrist joint. CHENU (J. C.) (*Aperçu*, etc., *pendant* la guerre de 1870–1871, T. I, p. 492) tabulates one hundred and one exarticulations at the wrist, of which sixty-nine, or 68.32 per cent., were fatal. BECK (B.) (*Chirurgie der Schussverletzungen*, 1872, S. 842) gives two cases of exarticulation at the wrist joint: one patient recovered, one died. MACCORMAC (WM.) (*Notes and Recollections of an Ambulance Surgeon*, London, 1871, p. 130) tabulates two successful exarticulations at the wrist. Apart from references in systematic surgical treatises, the following writings may be consulted on amputations at the wrist: BRASDOR (*Ess. sur les amputations dans les artic.*, in *Mém. de l'Acad. de Chir.*, 1774, Vol. V, p. 789) observes: "Les fonctions de la main exigeant des mouvemens variés, l'articulation du poignet à une structure relative. Les surfaces articulaires sont presque planes, leur connexion est lâche; aussi l'amputation dans cet article est elle facile à exécuter," and describes the manner of operating. BONA (C. A.), *Extirpation der Hand im Gelenke*, in *Jour. für Chir. und Augenheilkunde*, Berlin, 1825, B. VIII. p. 88. URE, *Amputation at the wrist with the cartilaginous surfaces left intact*, in *The Lancet*, 1855, Vol. I, p. 155. WARD (N.), *Amputation at the wrist joint*, in *The Lancet*, 1859, Vol. I, p. 504. *Amputation at the Wrist Joint. State of the stump sixteen years afterward*, in *Med. Times and Gaz.*, London, 1860, p. 211. BARELLA (L.), *Désarticulation radio-carpienne par la méthode oblique, de* M. SOUPART, in *Arch. Bel. de Méd. Mil.*, 1862, T. XXX, p. 430. KLEMM (N. G.), *Exarticulatio carpo-radialis*, in *Upsala Läkareförens Förhandl.*, 1874–75, p. 141. POUPART (J. D.), *Nouveaux modes et procédés pour l'amputation des membres*, Bruxelles, 1847. PETIT (J. L.), *Remarques sur les amputations que l'on fait aux articulations*, in *Œuvres complettes posthumes*, 1844, p. 846.

[7] MOSSAKOWSKY (P.) (*Statistischer Bericht über* 1415 *Französische Invaliden des Deutsch-Französischen Krieges*, in *Deutsche Zeitschrift für Chir.*, 1872, B. I, S. 337) records 22 cases of shot fracture of the wrist joint among the French invalids that passed through the International agency at Basel. In 19 cases, amputation had been performed—1 in the arm, 18 in the forearm. In the 3 conservatively treated cases anchylosis supervened—in 1 instance with extreme palmar contraction. BERTHOLD (*Statistik der . . . invalide ge[illegible]enen Manuschaften des* 10 *Armee-Corps*, in *Deutsche Mil. ärztl. Zeitschrift*, 1872, B. I, S. 517) gives an account of 21 invalids of the 10th Army Corps [illegible] had received shot fractures of the wrist joint. 17 had been conservatively treated: twice amputation in the forearm had been performed, and twice resection; all were unable to support themselves by manual labor.

Section VIII.

WOUNDS AND OPERATIONS IN THE HAND.

The wounds of the hand[1] that will be considered in this Section, for the most part in the shape of numerical statements, are shot fractures of the metacarpal bones and the phalanges, the various disarticulations, amputations, and excisions necessitated by these injuries, and the complications to which they gave rise.[2]

Table CXLIV.

Numerical Statement of Eleven Thousand Three Hundred and Sixty-nine Fractures of the Bones of the Hand for Shot Injury.

Mode of Treatment	Cases.	Bones of the hand injured.																Mortality of determined cases.

Though generally regarded as trivial accidents, shot wounds of the hand are extremely painful and troublesome of management.[3] The traditional impression that they are particularly liable to induce tetanus is not confirmed but rather disproved by the reports, since this complication supervened in only twenty-four instances in the large series of over

[1] The Hand, from *Gothic*, handus; *Gr.*, ΧΕΙΡ, the hand, or rather arm and hand, hence ἄκρα χείρ, for the hand; *Dutch, Ger., Sw.*, hand; *Dan.* haand; *Icel.*, hond; *Lat.*, manus; *Fr.*, main; *Ital.*, mano.

[2] Ravaton (*Chirurgie d'Armée*, 1768) devotes the twenty-sixth chapter of his excellent work to shot wounds of the hand, and adduces several remarkable cases. He thinks, notwithstanding the infinite variety of their injuries, they may be subdivided into those in which the missile perforates the hand by the shortest route and those in which it traverses obliquely the longest passage. He strongly advocates conservative measures, but admits that there are injuries hopelessly incurable, and observes that the closest attention and best anatomical knowledge are requisite in order to discriminate the several varieties of injury, and that the conditions should be most carefully ascertained before any decided step is taken.

[3] Cole (J. J.) (*Military Surgery, or Experience of Field Practice in India*, 1852, p. 157) remarks of shot injuries of the hand: "These wounds are extremely painful and slow to heal; they are, moreover, somewhat dangerous, and difficult to manage." Guthrie (G. J.) (*A Treatise on Gunshot Wounds*, 3d ed., 1827, p. 541) observes: "Gunshot wounds of the hand are particularly disagreeable, in consequence of the tendency they have to bring on trismus or locked jaw, and to avoid this, in many instances the hand has been removed when it might otherwise have been in part saved."

eleven thousand wounds of this description,[1] a very small proportion, as will appear in the comparative statement in the article on Tetanus, in the *Third Surgical Volume*.

Shot Wounds of the Hand treated by Expectation.—While the strictest conservatism has always been enjoined in the treatment of shot injuries of the hand, yet, as over two-thirds of the cases in this series were wounds of the fingers with irreparable disorganization of structure, for the most part demanding amputation, operative interference was avoided in but about a fourth of the cases. A large proportion of these were perforations of the hand with fracture of the metacarpals.[2] An illustration will be given:

CASE 2045.—Private C. J. Chappel, Co. I, 86th New York, aged 26 years, was wounded at Beverly Ford, Virginia, June 9, 1863, and was taken to the Cavalry Corps Hospital. A musket ball had entered the palm of the right hand and emerged on the dorsum, shattering the third and fourth metacarpals. Cold-water dressings were applied, and the patient was sent to Washington. Surgeon G. S. Palmer, N. Y. Vols., records his admission to Lincoln Hospital June 10th, and transfer to Satterlee Hospital, Philadelphia, June 22d. Soon after his arrival at Lincoln, Surgeon John H. Brinton, U. S. V., recognizing the case as a typical example of palmar-dorsal shot perforations of the hand, had prepared by Mr. Stauch, of the Army Medical Museum, a water-color drawing, which is copied in the upper part of the chromo-lithograph (PLATE LII) opposite. At Satterlee Hospital Acting Assistant Surgeon J. Hampden Porter reported that: "The hand was much tumefied and very painful, and the discharge sanious. The hand was placed on a cushioned splint and treated with ice dressings. A saline cathartic was exhibited, and the patient was allowed full diet. In twenty-four hours the appearance of the wound changed for the better. The character of the discharge altered, and the tumefaction decreased. The patient had no relapse or untoward complication of any kind, either locally or in his general health. The necrosed splinters that detached themselves were removed without trouble or pain, and the wound rapidly healed, and, on September 9th, the man was transferred to Second Battalion of the Invalid Corps. When I examined him, on October 18, 1863, he had some deformity of the hand, with a tumor on the palmar surface, and loss of movement in the medius, and partial loss of power in the ring finger. The rest of the member was serviceable." The man's name does not appear on the Pension List.

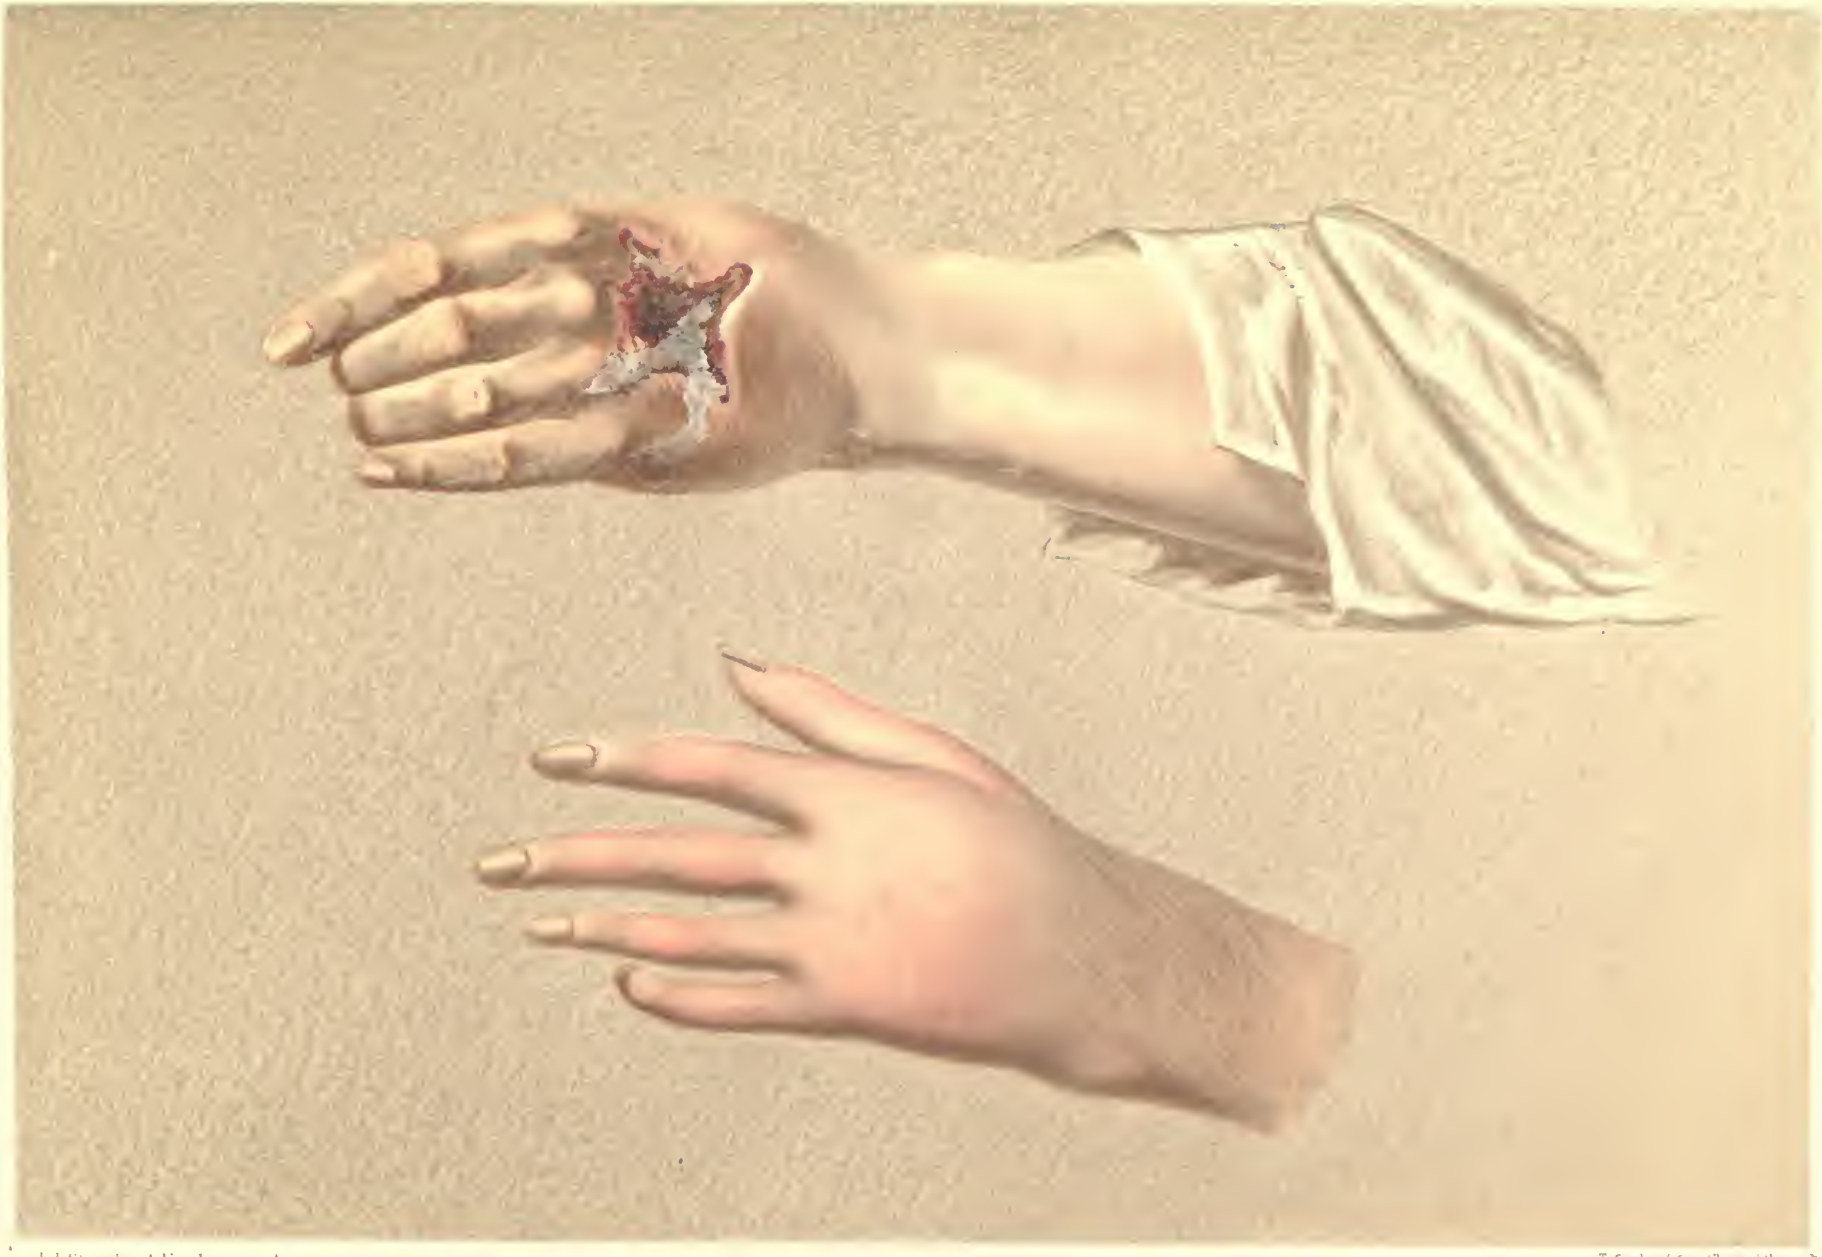
I would here call attention, by a remarkable example, to the paralysis and deformities of the hand incident to shot lesions of nerves in proximal portions of the upper extremity:

CASE 2046.—The case of Private George I. Grothers, Co. H, 22d N. Y. Cavalry, aged 21 years, has been briefly adverted to at page 465 of this Chapter as CASE 1369, under the head of shot flesh wounds of the upper arm, implicating large nervous trunks. It may be reverted to as an interesting example of the effect of such shot injuries upon the nutrition and functions of the hand. The patient was sent to Washington, and entered Stanton Hospital, where Acting Assistant Surgeon D. W. Prentiss prepared the following notes of the case: "This interesting example of reflex nervous action occurred in the person of Private G. I. Grothers, 22d N. Y. Cavalry, wounded October 1, 1864, in action south of Petersburg, while holding up his left arm in reining in his restive horse. A musket ball entered the inner anterior aspect of the upper arm, and passing under the tendon of the biceps emerged two inches posteriorly, above the external condyle. The brachial artery was probably severed, the median nerve undoubtedly wounded. The patient lost much blood, and fainted on the field from the combined effect of haemorrhage and shock. After reviving, much pain was persistently felt in the hand alone, except on the fourth and fifth days, when there was slight pain at the seat of injury. The pain in the hand was of a very sharp, burning, stinging character, and was very severe for the first few weeks; it did not appear immediately after consciousness was restored, but some hours after. Cold-water applications gave some relief to the pain. The immediate effect of the wound was a strong contraction of the flexors of the hand, causing it to clutch so strongly that the fingers could only be extended by the aid of the other hand. Stiffness and swelling of the digital joints followed, very like rheumatism. The elbow was flexed at an angle of 90°, but gradually became extended, until January 8, 1865, the limb was extended at about 135°. Perhaps the most interesting circumstance connected with the case was the reflex nervous action from the opposite hand. Whenever anything of a dry, rustling character, such as a newspaper, was taken into the right hand, pain was caused, and motion in the left index especially, and the whole of the hand, the pain being most acute in the second metacarpo-phalangeal joint. This effect was most marked when the index finger of the right hand was touched, but was shown in less degree when other fingers were tried. Pain was produced at the same points, but not motion, by pressing on the median nerve. This condition has been gradually improving under treatment by electricity and topical anodyne applications to the *hand*,—for they are not borne at the seat of wound. Acetate of lead and opium with volatile liniment were found to be the most effective local applications. Mr. Keeler, the head nurse of Ward 3, at Stanton Hospital, made a drawing of the hand, which faithfully represents its altered appearance." [The drawing is reproduced in the lower of the two figures in PLATE LII.]

In the expectant treatment of shot wounds directly involving the hand, the necessity of removing all detached splinters of bone as well as all foreign bodies, as part of the primary dressing, was generally recognized and obeyed. The utility of free incisions

[1] Among the 11,339 cases of shot injuries of the hand, but 24 cases of tetanus were reported, viz: 9 fatal cases after shot fractures of the metacarpus treated by expectation; 14 cases with 4 recoveries, after amputation of the fingers for shot injury; 1 fatal case after disarticulation at the wrist.

[2] Of 3,092 shot injuries of the hand treated by expectation, 1,967 were fractures of the metacarpals, 119 perforations of the metacarpo-phalangeal articulations, 162 injuries of the phalanges, 544 shot wounds of the hand of unspecified position. The mortality of the entire series was a little over 2 per cent.



Ed. Stauch et Keeler, pinxt.

PLATE LII. EFFECTS OF DIVISION OF ULNAR NERVE AND OF SHOT PERFORATION OF HAND.

through the aponeurotic layers, and of thus preventing accumulations of matter under fasciæ and tendons, or relieving tension caused by such collections, was also appreciated, although an unreasonable dread of wounding the arteries of the palm was sometimes indulged. Hæmorrhage uncontrollable by pressure was very rare. The usual treatment was to lay the hand upon a padded palmar splint, and to employ cold-water dressings until suppuration was established and warm fomentations became more agreeable to the patient. In the comparatively infrequent attempts to preserve mangled fingers, careful coaptation of the parts on a digital splint became necessary. While some of the surgeons shared Guthrie's exaggerated aversion to poultices, others pronounced them very useful in lacerations of the hand, and thought, with Stromeyer, that they were earlier indicated and might be longer employed than in most other regions. The excellent resource of local tepid baths, of ready applicability in these injuries, was seldom used.

Shot Wounds of the Hand treated by Excision.—A hundred and sixteen excisions of the metacarpal bones without removal of the corresponding fingers were serious operations, ten cases proving fatal.[1] In nine, including two fatal cases, resort was had to amputation in the forearm.[2] In short, the histories of this series confirm the precept of Dr. Stromeyer, that operative interference should be unthought of in such cases. Excisions of parts or extirpation of one or more metacarpals conjointly with their corresponding fingers were not infrequent; but such ablations, which are often imperative, are usually classified as amputations or disarticulations rather than resections.[3] Six or seven instances were reported of alleged excisions of the articulation between the proximal and middle phalanges, and several examples of extraction of splinters or exfoliations, or extraction of carious terminal phalanges, were returned under the imposing title of excisions.

Shot Wounds of the Hand treated by Amputation.—Seventy-nine hundred and two cases of shot wounds of the hand were treated by partial or complete ablation of one or more fingers, with or without the ends or entire shafts of the corresponding metacarpals,[4] and two hundred and fifty-nine cases by amputation at the wrist or higher up in the extremity. All of the latter group have been detailed in previous Sections; they furnished a mortality of 19 per cent. In the former group, were sixty instances of re-amputation, either at the wrist or above, with a fatality of 31.6; while the fatal cases in the remainder of the series amounted to only 2.6 per cent. Imperfectness in the reports precludes the possibility of a complete classification of the operations according to the date at which they were performed; but a scrutiny of several large series of cases of amputations of fingers determined with precision,

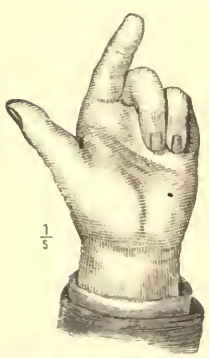

FIG. 740.—Hand six months after amputation of medius for shot injury. *Spec.* 2954.

FIG. 741.—Hand three months after amputation of the index, medius, and ring fingers. *Spec.* 4027.

[1] Of the 116 excisions, 104 resulted favorably, 10 fatally; the results in two instances are unknown. There were 64 primary excisions, with 6 deaths, one fatal case being associated with an amputation of the thigh for shot fracture—the case of Pt. C. H. Maddock, 1st Maine Art., to be noticed hereafter, and 2 with intermediary amputation in the forearm—the cases of Pt. Cummings, 20th Mass., and Pt. Rowell, 19th Maine, recorded in TABLE CXXXVI, pp. 986–7, as Nos. 11 and 66. The 2 intermediary, 2 of uncertain date, and 6 primary fatal cases succumbed from pyæmia.

[2] The two cases that resulted fatally after consecutive amputation in the forearm have just been noted. Of the 7 cases of recovery, 4 were intermediary amputations in the forearm, and are recorded in TABLE CXXXV, p. 981, as Nos. 123, 120, 280, and 285; 3 were secondary operations, and appear in TABLE CXXXVII, p. 988, as Nos. 32, 57, and 131.

[3] Several instances of removal of fingers and metacarpals together with parts of the carpus and even of the distal ends of the bones of the forearm, have been cited in the preceding Section—*e. g.*: CASE 2000, p. 1005 (Hobbs), CASE 2022, p. 1009 (Massey) CASE 2031, p. 1010 (Burns).

[4] TROCCON (*Mém. sur l'amput. du poignet*, Paris, 1827) is reported to have first proposed in 1816, resection in the continuity of the metacarpals, and ROUX to have earliest practised the operation, in 1821.

shows that nearly three-fourths were primary, with a mortality of 1.4 per cent.; somewhat over one-fourth, with a mortality of 3.7 per cent., intermediary; and less than 2 per per cent. secondary, no fatal cases being returned in the last category.

FIG. 742.—Cast of right hand after amputation of the index, middle, and ring fingers for shot injury. *Spec.* 4380.

Sixty-eight hundred and seventy cases of ablation of the digits only, gave a mortality of 2 per cent.; four hundred and thirteen cases in which the metacarpo-phalangeal articulations were interested, and ends of metacarpal bones removed, a mortality of 3.2 per cent.; six hundred and nineteen cases in which corresponding metacarpals were removed with fingers, a mortality of 7.6 per cent. An analysis of the determined cases shows that the index was the digit most frequently amputated, next the medius, next the ring finger, next the thumb, and lastly the little finger. Then followed in analogous order the amputation of two or more digits.[1] There was a slight preponderance of operations on the left side, and the amputations on this side show slightly less favorable results than on the right.[2] The results of many of these varieties of amputation are illustrated by drawings or casts in the Museum. A stump of the medius, after removal of the two distal phalanges, is represented by FIGURE 559, on page 788.[3] The appearance of a hand after amputation of the middle finger[3] with the end of the third metacarpal is shown in FIGURE 740. Ablation through the proximal phalanges of the index, medius, and ring fingers[4] is illustrated by FIGURE 741. A palmar view of the results of an amputation of the same digits with the ends of the corresponding metacarpals[5] is presented in FIGURE 742. FIGURE 743 shows ablation of the ring and little fingers;[6] and the results of primary amputation of the ring finger, with removal of half of the fourth metacarpal,[7] is shown in FIGURES 744 and 745. On page 1007 may be found an illustration (FIG. 730) of a hand in which the three outer fingers with their metacarpals were removed, the thumb, index, and wrist remaining perfectly flexible and useful. Such examples offer great encouragement to the conservative practitioner. Besides these examples of grave mutilations of the hand, the Museum

FIG. 743.—Cast of right hand after ablation of the ring and little fingers with their metacarpals. *Spec.* 591.

FIG. 744.—Cast after removal of fourth left metacarpal and ring finger. *Spec.* 4362.

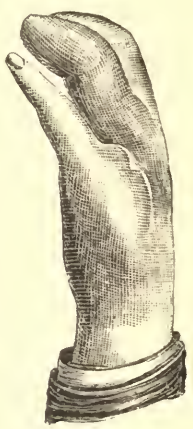

FIG. 745.—Another view of the same specimen. The cast taken six months after operation.

[1] The distribution of amputations of the fingers per thousand was as follows: Index, 294; medius, 258; ring finger, 122; thumb, 110; little finger, 82. The multiple amputations run: Index and medius, 42; medius and ring fingers, 26; ring and little fingers, 16; thumb and index, 12; index, medius, and ring fingers, 14; medius, ring, and little fingers, 8; thumb, index, and medius, 4; four outer digits, 2; all five digits, 4.

[2] The proportions as ascertained from cases in which the side operated on was determined were: Amputations on the right side, 46.7 per cent., with a mortality rate of 2.3 per cent.; amputations on the left side, 53.3 per cent., with a fatality of 3.7 per cent., which closely agrees with the mean fatality of 2.9 per cent., given in TABLE CXLIV, as deduced from all the cases, whether the side operated on was specified or not.

[3] Case of Private H. Sanford, 44th New York, Wilderness, May 5, 1864. The regimental surgeon, Dr. M. W. TOWNSEND, amputated the middle finger and head of the metacarpal on the field. Assistant Surgeon J. H. ARMSBY, U. S. V., contributed a cast (FIG. 740) of the hand, six months after operation. This soldier was pensioned, and was paid December 4, 1875. It is stated that the ring and little fingers were rigidly contracted.

[4] Case of Private E. Southard, 119th New York, Lost Mountain, June 16, 1864. Primary amputation of three fingers on the field. Assistant Surgeon J. W. S. GOULEY, U. S. A., contributed the cast of the hand (FIG. 741).

[5] Case of Private P. Canavan, 88th New York, Spottsylvania, May 12, 1864. Shell laceration, followed by primary amputation. Acting Assistant Surgeon G. F. SHRADY contributed the cast (FIG. 742). This soldier was pensioned, and died of phthisis August 24, 1874.

[6] Case of Private W. H. Reynolds, 115th New York, near Richmond, October 27, 1864: shot fracture and removal on field of ring and little fingers, with half of the fourth and the whole of the fifth metacarpals. Professor ARMSBY contributed the specimen (FIG. 743).

[7] Case of Private Crans, 187th New York, Chancellorsville, May 3, 1863; amputation on field. Acting Assistant Surgeon G. F. SHRADY presented the cast (FIGS. 744, 745). Pensioner paid December 1, 1875.

possesses many illustrations of very perfect results after amputations of the fingers. In some instances of removal of the medius or ring finger, with the head of the corresponding metacarpal, the deformity is but slightly apparent.

Thirty-one instances were reported of alleged self-inflicted shot mutilations of the fingers. Conscripts seeking to evade service by self-mutilation, commonly attempt to destroy the terminal phalanx of the right index alone, and to inflict as little additional injury as practicable. In analyzing these thirty-one cases, I find more wounds on the left than on the right side, and the thumb and three outer digits together were interested more frequently than the index.[1]

The very important subject of wounds of the palmar arches[2] has been quite fully

[1] This accusation is frequently brought against conscripts or drafted men. This was especially the case after Bautzen and Leipzig, where the frequency of such accidents among the young French recruits excited suspicion. Baron LARREY on these occasions, after careful enquiries, completely vindicated the soldiers. The same accusation has been renewed in the War of 1870–71, by M. SABATIER (See CHENU, *Aperçu Hist.*, 1874, T. I. p. 419): "*Les mutilations volontaires des doigts ont été nombreuses dans les rangs de la garde mobile mais c'est surtout à l'armée de l'Est qu'on en a constaté le plus grand nombre.*" Such allegations commonly come from inexperienced surgeons or sensational correspondents, but, after Sedan, so cool and discreet an observer as Dr. W. MACCORMAC was "astonished at the number of soldiers who had got the end of the forefinger shot off. I suppose there were nearly two dozen. Mostly it was the forefinger of the left hand." (*Notes*, etc., *op. cit.*, p. 10.)

FIG. 746.—Surgical anatomy of the palmar aspect of forearm and hand. [After BOUGERY.]

FIG. 747.—Surgical anatomy of the dorsal aspect of the forearm and hand. [After BOUGERY.]

discussed at page 437, in the first Section of this Chapter. I cite here other observations and monographs on the subject, and the excellent drawings (FIGS. 746, 747) of the surgical topography of the hand and forearm of M. Bougery. Bleeding from the palmar arches is very uncommon after shot laceration, the vessels behaving as if treated by torsion. If direct compression, unaided by styptics, does not suffice, the bleeding point should be exposed and double ligatures applied. Experience is adverse to treatment by compression or by ligation of the radial, ulnar, or brachial arteries.

Of the frequency of shot wounds of the hand in battle, it may be observed that in the series of casualty lists that have been selected as most exact, including 105,786 cases of shot wounds reported during the last year of the war, 775 of the number, or 0.7 per cent., were of the wrist; 5,708, or 5.3 per cent., of the metacarpus; 5,287, or 4.9 per cent., of the phalanges or fingers.

The advantage of one or two fingers, or the thumb and a single finger, or even of the index alone, is so great, that much should be hazarded to save them. This doctrine, confirmed by the experience of the War, has been taught by experienced military surgeons from early times. The precept of Ravaton, quoted at the beginning of this Chapter, only re-echoes the teachings of Belloste[1] and LeDran,[2] his predecessors. The pension reports, and the examinations of invalids abroad,[3] with rare exceptions,[4] attest the soundness of these views. Sometimes a medius or a ring finger, powerless or rigidly contracted in the palm, may interfere with prehension and be decidedly an encumbrance; but usually the most deformed digit is found preferable to none.

It is a grateful reflection that while this volume has treated largely of the various modes of operative interference often indispensable in the surgery of war, the general teaching deduced from the multitude of facts tends, not only in regard to the hand, but in relation to every region, to justify and encourage an enlightened conservatism.

[1] BELLOSTE, a military surgeon, who saw much service after Blenheim, Ramilies, Malplaquet, and the other great battles of his time, states (*Le Chirurgien d'Hôpital*, Paris, 2ème éd., 1716, p. 202) that: "From the commencement of the war I have dressed a vast number of hands, perforated, lacerated, or half torn away by missiles that struck them. These accidents are not uncommon in armies. I have also dressed many others simply penetrated by balls or injured by cutting weapons, of which I need not treat particularly. I will only say, that of all the hands I have dressed in these later times, I have always preserved what remained of the part, without the necessity of removing many splinters or losing phalanges, although there might be great laceration and injury of these organs. It is true that in wounds of this sort, as in others, I have avoided frequent dressings, and the use of maturatives, and I avow that spirits of wine has always been my favorite remedy in wounds of the extremities, and those especially of aponeurotic or nervous parts. I know that many of the ancients hold that wounds of the nerves and tendons should be kept open, to allow, as they say, to the issue of matters that might alter the substance of those tissues, but my experience is that it is more salutary for the wounded men to prevent suppuration rather than to promote it, etc."

[2] LEDRAN (HENRI FRANÇOISE) teaches, in his *Traité ou Reflexions tirées de la Pratique sur les Playes d'Armes à feu*, 1787, p. 214, that: "Shot wounds of the metacarpus are susceptible of many complications, both because of the number of bones that may be fractured and on account of the numerous tendons that pass to govern the movements of the fingers. These tendons when lacerated inflame, and their inflammation is usually propagated to the muscles of the forearm, when more or less considerable swelling occurs, and often interstitial abscesses. This seldom supervenes without the annular ligament, similar in structure to the tendon at the wrist, swelling also more or less." He adds that early free incisions are indispensable—and free drainage; but that it is desirable not to divide the annular ligament save under very urgent circumstances. Of shot wounds of the fingers he remarks (*op. cit.*, p. 216): "It is rarely that a shot injury of one of the fingers fails to carry away the finger wholly or in part. These wounds are often accompanied by inflammation and abscesses extending to the hand and also to the forearm. The fingers are so necessary to man that every effort for their conservation should be made; and supposing a fracture with wound, we should act as if it were an arm or thigh, the bones of which are seldom clearly fractured. Nevertheless, it is sometimes necessary to amputate the fingers, either at the articulation with the phalanges, or in the middle of a proximal phalanx above the wound."

[3] PIROGOFF (N.) (*Grundzüge der Allgemeinen Kriegschirurgie*, Leipzig, 1864, S. 808): "Clean perforations of the metacarpus we rarely observed; generally the wounded arrived at the field hospitals with hands mutilated in a variety of ways by shell. And yet these injuries, although frequently accompanied by large loss of substance and frightful in appearance, do not offer a worse prognosis than the injuries from small shot, as, for instance, a clean perforance of the hand by a bullet. Numerous examples of conservation of one-third of the hand with only two or even one finger only prove this. . . Even though the preserved fingers are ever so stiff and inflexible, and resembling little sticks more than fingers, they nevertheless prove themselves afterward very serviceable little sticks."

[4] BERTHOLD (*Stat. der durch den Feldzung* 1870–71, *Invalide gewordenen Mannschaften des* 10 *Armee-Corps*, in *Deutsche Mil.-ärztl. Zeitschrift*, 1872, B. I. S. 518) gives an account of 198 invalids for shot injuries of the hand: in 9 instances amputation, and in 13 exarticulation of the fingers and phalanges had been performed. Dr. BERTHOLD observes: "From the certificates it is apparent that a large number of invalids were pensioned on account of a single stiff and flexed finger being bent upon the palm of the hand. Such abnormal positions of single fingers, generally the results of unimportant injuries, hinder necessarily the use of the hand, and prejudice the handling of weapons and the performance of manual labor seriously, while a disarticulation performed at the proper time would have left the hand undoubtedly useful. It is to the interest of the wounded, as well as of the Government, that the exarticulation of single phalanges or fingers be made more frequently."

LIST OF PLATES.

1. PLATE I, facing p. 23. RUPTURE OF THE JEJUNUM BY THE KICK OF A HORSE. Case of Frank R——, page 23, Spec. 6188. (Woodburytype or Photo Relief Print.)

2. PLATE II, facing p. 72. ENTEROGRAPHY FOR A SHOT WOUND OF THE ILEUM. Specimen 4390, case of W. W——, p. 72. (Woodburytype.)

3. PLATE IV, facing p. 77. FÆCAL FISTULA AFTER SHOT PERFORATION OF THE ASCENDING COLON. Case of Harsh, p. 77. (Chromolithograph.)

4. PLATE V, facing p. 81. CICATRICES AFTER SHOT PERFORATIONS OF THE ABDOMEN. *Two figures.* FIG. 1, case of Morell, p. 80. FIG. 2, case of Corson, p. 213. (Lithograph.)

5. PLATE III, facing p. 113. SHOT WOUND OF THE ILEUM CLOSED BY THE CONTINUED SUTURE. Specimen 4389, case of W. W——, p. 72. (Woodburytype.)

6. PLATE VI, facing p. 133. METASTATIC FOCI IN THE LIVER. Case of Fole; to be related in the *Third Surgical Volume.* (Chromolithograph.)

7. PLATE X, facing p. 181. HERNIA OF THE JEJUNUM THROUGH A SHOT PERFORATION. Spec. 1604, case of F——, p. 184. (Woodburytype.)

8. PLATE XI, facing p. 205. RUPTURE OF THE ILEUM BY THE KICK OF A MULE. Spec. 6269, case of S——, p. 205. (Woodburytype.)

9. PLATE XXXVI, facing p. 212. SHOT PERFORATION OF THE RIGHT ILIUM. Specimen 2869. (Woodburytype.)

10. PLATE XXXIV, facing p. 221. CARIOUS SHOT FRACTURE OF THE RIGHT ILIUM. Specimen 3900, case of I——, p. 220. (Woodburytype.)

11. PLATE XXXV, facing p. 223. FRACTURE OF THE LEFT OS INNOMINATUM BY A SHELL FRAGMENT. Specimen 4130, case of E——, p. 223. (Woodburytype.)

12. PLATE XXXVII, facing p. 225. CARIES AND NECROSIS AFTER A SHOT PERFORATION OF THE LEFT ILIUM, WITH A BALL-FRAGMENT SUSPENDED IN THE SHOT CANAL, AND A FISSURE EXTENDING INTO THE COTYLOID CAVITY. (Woodburytype.)

13. PLATE XLI, facing p. 256. INSTRUMENTS FOR RESECTION. (Chromolithograph.)

14. PLATE VII, facing p. 272. VESICAL CALCULI FORMED UPON PROJECTILES. *Seven figures.* FIG. 1, Spec. 5520, case of Cockroft, p. 273. FIG. 2, Spec. 88, case of Lotes, p. 272. FIG. 3, Spec. 4394, case of Palmer, p. 270. FIG. 4, Spec. 5019, case of *Shrimp*, p. 274. FIG. 5, case of McIntosh, p. 273. FIG. 6, Spec. 6203, case of Ely, p. 275. FIG. 7, Spec. 5931, case of Satamore, p. 276. (Lithograph.)

15. PLATE VIII, facing p. 280. VESICAL CALCULI REMOVED AFTER SHOT WOUNDS. *Five figures.* FIG. 1, Spec. 2567, case of M——, p. 294. FIG. 2, Spec. 5041, case of H——, p. 278. FIG. 3, Spec. 4712, case of *Moore*, p. 279. FIG. 4, Spec. 1687, case of Perry, p. 280. FIG. 5, Spec. 6211, case of *P*——, p. 291. (Lithograph.)

16. PLATE XII, facing p. 395. URETHRAL INSTRUMENTS. *Nine figures.* (Lithograph.)

17. PLATE IX, facing p. 430. LACERATION OF THE BUTTOCKS BY A SHELL FRAGMENT. Case of Tucker, p. 430. (Chromolithograph.)

18. PLATE XLV, facing p. 488. COMMINUTED SHOT FRACTURE OF LEFT SCAPULA. Specimen 3585, case of S——, p. 488. (Woodburytype.)

19. PLATE XIII, facing p. 520. RESULTS OF EXCISIONS OF THE HEAD OF THE HUMERUS. *Four figures.* FIG. 1, case of Kelly, p. 590. FIG. 2, case of Jones, p. 521. FIG. 3, case of Yukey, p. 548. FIG. 4, case of Clarke, p. 575. (Lithograph.)

20. PLATE XIV, facing p. 529. RESULTS OF EXCISIONS OF THE HEAD OF THE HUMERUS. *Four figures.* FIG. 1, case of Jacobs, p. 553. FIG. 2, case of Henderson, p. 529. FIG. 3, case of Reardon, p. 552. FIG. 4, case of Rand, p. 529. (Lithograph.)

21. PLATE XVII, facing p. 536. RESULTS OF EXCISIONS OF THE HEAD OF THE HUMERUS. *Four figures.* FIG. 1, case of Quindlen, p. 552. FIG. 2, case of Nicholson, p. 574. FIG. 3, case of Pratt, p. 552. FIG. 4, case of Ewing, p. 550. (Lithograph.)

22. PLATE XVIII, facing p. 544. RESULTS OF EXCISIONS OF THE HEAD OF THE HUMERUS. *Four figures.* FIG. 1, case of Morrison, p. 550. FIG. 2, case of Winser, p. 529. FIG. 3, case of Singleton, p. 574. FIG. 4, case of Ross, p. 538. (Lithograph.)

23. PLATE XLVI, facing p. 640. SHOT COMMINUTIONS OF THE HUMERUS. Specimens 2822 and 1234. *Two figures.* Left-hand figure, case of Sewell, p. 640. Right-hand figure, case of *Doggett*, p. 616. (Woodburytype.)

24. PLATE L, facing p. 668. SHOT CONTUSIONS OF THE SHAFT OF THE HUMERUS. *Two figures.* FIG. 1, Spec. 6309, referred to at pp. 667–8. FIG. 2, Spec. 6312, case of Eaton, pp. 468 and 688. (Woodburytype.)

25. PLATE XXII, facing p. 736. *Two figures.* 1. OSTEOMYELITIS OF HUMERUS, case of L——, p. 736. 2. LIGATION OF POPLITEAL, case of Aseltyne; to be described in the *Third Surgical Volume.* (Chromolithograph.)

26. PLATE XV, facing p. 739. HOSPITAL GANGRENE OF AN ARM STUMP. Case of Wallen, p. 739. (Chromolithograph.)

27. PLATE XLVII, facing p. 762. TUBULAR SEQUESTRA FROM AMPUTATIONS OF THE HUMERUS. *Four figures.* Upper left-hand figure, Spec. 142, case of Millett, pp. 470, 785. Upper right-hand figure, Spec. 1266, case of Harvey, p. 770. Lower left-hand figure, Spec. 4333, case of McKnight, p. 740. Lower right-hand figure, Spec. 2209, case of *Anderson*, p. 761. (Woodburytype.)

28. PLATE XLVIII, facing p. 782. INVOLUCRA OF BONES OF THE FOREARM AND SEQUESTRUM FROM HUMERUS. Specimens 3686 and 3727, case of Strain, p. 782. (Woodburytype.)

29. PLATE XLIV, facing p. 788. NECROSIS OF THE RIGHT RADIUS AND ULNA. Specimen 4170, case of Martz, p. 788. (Woodburytype.)

30. PLATE XIX, facing p. 842. NECROSIS OF THE HUMERUS AFTER SHOT INJURY. Specimen 2749, case of W——, p. 842. (Woodburytype.)

31. PLATE LIII, facing p. 850. RESULTS OF EXCISIONS OF THE ELBOW JOINT FOR SHOT INJURY. *Two figures.* FIG. 1, case of Tracy, p. 850. FIG. 2, case of Riley, p. 869. (Lithograph.)

32. PLATE LI, facing p. 872. BONES OF ELBOW EXCISED FOR SHOT INJURY. *Six figures.* FIG. 1, Spec. 15, case of Campbell, p. 872. FIG. 2, Spec. 1365, case of Dempsey, p. 886. FIG. 3, Spec. 3466, case of Perkins, p. 891. FIG. 4, Spec. 998, case of Lewis, p. 888. FIG. 5, Spec. 925, case of Douglas, p. 870. FIG. 6, Spec. 1309, case of Sehe, pp. 791, 873. (Heliotype.)

33. PLATE LIV, facing p. 908. RESULTS OF RESECTIONS AT THE ELBOW FOR SHOT INJURY. *Two figures.* FIG. 1, case of Hertzog, p. 876. FIG. 2, case of Keller, p. 889. (Lithograph.)

34. PLATE XVI, facing p. 928. HOSPITAL GANGRENE. Case of Keables, p. 928. (Chromolithograph.)

35. PLATE LII, facing p. 1020. EFFECTS OF DIVISION OF ULNAR NERVE AND OF SHOT PERFORATION OF THE HAND. *Two figures.* Upper figure, case of Chappel, p. 1020. Lower figure, case of Grothers, pp. 465 and 1020. (Chromolithograph.)

CORRIGENDA.

Page 9, thirty-first line, for New Orleans, read *Greenville.*
Page 12, forty-second line, for 1864, read "1863."
Page 13, twenty-third line, for section, read *volume;* and forty-first line, for Keene, read *Keen.*
Page 16, third line, for J. S. Meleher, read *S.* S. Melcher; and fifteenth line, for F. Mecham, read F. *Meacham;* and eighteenth line, for Army read *Armory;* and nineteenth line, for V. H. B. Lung, read V. H. B. *Lang.*
Page 25, Note 1, third line, for mesentery, read *mesenteric.*
Page 33, twenty-eighth line, for C. K. Irvin, read *C. K. Irwine;* and fourth line of Note 1, for J. P. Cleary, read *P. J. A.* Cleary.
Page 37, twentieth and twenty-sixth lines, for Thomaine, read *Thomain;* and Note 1, second line, for 1868, read "1863."
Page 43, seventy-first line of note, for Literature, read *Litterature.*
Page 46, forty-third line, for C. Hard, read *A.* Hard.
Page 49, thirty-first line, for Redfern Sharpe, read *Redford Sharp.*
Page 51, seventeenth and thirty-fifth lines, for A. Chappell, read A. *Chapel.*
Page 54, twenty-third line, for stomacal, read *stomachal.*
Page 59, Note 1, tenth line, for Kluyskem, read *Kluyskens;* and for 389 read "289."
Page 63, Note, for 1852, read "1832."
Page 68, Note 1, first line, dele the word *on.*
Page 69, thirty-sixth line, for A. E. Caruthers, read A. E. *Carothers.*
Page 74, Note 1, ninth line, for Racoux, read *Raucoux.*
Page 75, twentieth line, for naval, read *navel.*
Page 75, Note 1, ninth line, for Tuplius, read *Tulpius.*
Page 76, sixth line, for 1862, read "1861."
Page 76, thirty-first line, for July 26, read July "6."
Page 77, ninth line, for symptoms of treatment, read symptoms *or* treatment.
Page 81, sixty-third line, for Seaman, read *Leaman.*
Page 83, fiftieth line, for A. L. Lovell, read *A. L. Lowell.*
Page 84, fifth line, for Know, read *Knorr.*
Page 84, nineteenth line, for 1363, read "1863."
Page 87, fifty-third line, dele "Assistant."
Page 88, sixteenth line, dele "Acting Assistant," and read *Surgeon* John Neill, U. S. V.
Page 92, fifth line, read *Assistant Surgeon.*
Page 93, twenty-second line, for Orton, read *Osborne.*
Page 102, sixteenth line, for D. Bache, read *T. H.* Bache.
Page 105, case 308, ninth line, for Acting Assistant Surgeon J. B. Sturdevant, read *Assistant Surgeon S.* B. Sturdevant, 139*th Pennsylvania.*
Page 106, tenth line, for U. S. V., read 9*th New York Cavalry.*
Page 112, note 2, second line, for annoyance, read *occurrence.*
Page 117, thirty-eighth line, for Schmidt, read *Schmid.*
Page 119, twenty-first line, insert after the word "it" the word *is.*
Page 126, Note 3, eighth line, for microcosms, read *micrococcus.*
Page 131, Note 2, first line, for 1857, read "1867."
Page 132, Cases 408–481, fifteenth line, for 2d U. S., read "3d" U. S.
Page 132, Note 2, first line, for Vol. I, read Vol. *L.*
Page 133, Case 440, sixth line, for ænemic, read *anæmic.*
Page 136, Case 424, seventh line, should read *Assistant* Surgeon.
Page 137, third line, and first line Note 2, for PAROISSE, read "PARROISSE."
Page 139, Case 470, twenty-first line, before Surgeon, insert *Assistant.*
Page 139, Case 436, third line, for Small, read *Smull.*
Page 140, Case 316, first line, for Squires, read *Squire.*
Page 141, Case 319, second line, for Brennerman, read *Breneman.*
Page 143, Case 371, first line, for 29th, read "39th."
Page 144, Case 376, sixth line, dele *Assistant.*
Page 145, Cases 386–390, second line, for Byles, read *Byers.*
Page 145, Cases 391–395, fourth line, for Owego, read *Oswego.*
Page 146, Cases 391–395, twenty-sixth line, for Justin, read *Justice.*
Page 147, Case 402, sixth line, for Helsly, read *Helsby.*
Page 148, Case 403, second line, for Cammack, read *Camac.*
Page 156, Case 500, fifth line, for 1805, read "1865."
Page 156, Case 501, third line, should read William *P. McCullough.*
Page 165, Case 514, fifteenth line, for sanuious, read *sanious.*
Page 174, Case 563, third line, for 25th, read "26th."
Page 175, thirty-third line, for seems, read *serves.*
Page 182, Case 573, second line, for prenetrated, read *penetrated.*
Page 186, Case 595, third line, read *C. T.* Reber.
Page 188, Case 603, third line, for B. E. Frayer, read B. E. *Fryer.*
Page 192, Case 611, second line, for 1865, read "1864."
Page 192, thirty-first line, should read *G.* P. Hachenburg.
Page 200, Note 4, second line, for peritonis, read *peritonitis.*
Page 204, eighth line, for catagory, read *category.*
Page 211, thirteenth line, for religated, read *relegated.*
Page 213, Case 618, ninth line, for impossible, read *possible.*
Page 214, Case 623, third line, for Herbert, read *Herbst.*
Page 215, Case 626, first line, read *Assistant* Surgeon George M. Sternberg, U. S. A.
Page 220, Case 641, twenty-second line, for p. 28, read p. "228."
Page 220, Case 644, third line, insert after the word Assistant the word *Surgeon.*
Page 222, Case 648, third line, for and, read *was.*
Page 223, Case 650, fifth line, for James, read *Janes.*
Page 228, Case 664, first line, for 87th, read "57th."
Page 229, Case 672, first line, for May, read *February.*
Page 232, Case 678, tenth line, read J. *H.* Brinton.
Page 232, Case 679, seventh and ninth lines, for Assistant Surgeon J. T. Calhoun, U. S. A., read *Acting* Assistant Surgeon *A. W. Colburn.*
Page 240, thirty-eighth line, for E. W. McDonnell, read *E.* McDonnell.
Page 241, Note 1, ninth line, for Beitäge, read *Beiträge.*
Page 241, Note 1, fourteenth line, for Tract, read *Fract.*
Page 243, Case 705, eighth line, for John F. Hodgen, read John *T.* Hodgen.
Page 249, Case 729, fifth line, for N. Y. V., read *U. S.* V.
Page 251, Case 735, first line, for 1863, read "1862."
Page 258, Case 759, fourth line, for November, read *April.*
Page 260, Case 767, fourth line, dele the word "Cavalry."
Page 264, twenty-ninth line, should read Robert *B.* Potter.
Page 265, Case 784, third line, for Ray, read *Way.*
Page 266, Case 785, second line, for J. Studley, read J. *M. Study.*
Page 267, Case 794, ninth line, for 1863, read "1873;" and dele last line, after the word "urine."
Page 269, Note 4, fourteenth line, for p. 46, read p. "246."
Page 271, Fig. 221, first line, for Cylindroconical, read *Cylindro-conical.*
Page 271, Case 797, third line, for Assistant Surgeon, read *Surgeon.*
Page 271, Case 797, thirteenth line, for Thomas S. Christ, read *Theodore* S. Christ.
Page 274, thirteenth, twenty-first, and twenty-sixth lines, for S. W., read J. W. Hamilton.
Page 276, Case 804, first line, for Sitamore, read *Satamore.*
Page 280, Note 4, eighth line, for Lect., read *Sect.*
Page 282, TABLE VIII, Case 9, for S. W., read J. W. Hamilton.
Page 288, Case 825, second line, for Surgeon O. Evarts, U. S. V., read Surgeon O. *Everts,* 20*th Indiana.*
Page 288, Case 828, fourth line, dele the word "General."
Page 290, Case 846, fourteenth line, for Michigan, read *Maine.*
Page 291, Case 850, first line, for 1863, read "1862."
Page 293, Case 852, third line, for July, read *June* 19*th.*
Page 294, Case 857, fourth line, for R. N. Pease, read R. *W.* Pease.
Page 296, Case 862, second line, for U. S. V., read U. S. *A.*
Page 296, Case 863, first line, for D. Bagley, read D. *Baguley.*
Page 301, fifth line, for pathognomic, read *pathognomonic.*
Page 302, thirtieth line, for therepeutic, read *therapeutic.*
Page 304, Case 868, fifteenth line, for Assistant Surgeon E. M. Powers, U. S. V., read *Surgeon* E. M. Powers, 7*th Missouri.*
Page 306, Case 870, second line, for A. J. Wood, read A. J. *Ward.*
Page 307, Case 877, first line, for June, read *July.*
Page 313, Case 902, third line, for Lowry, read *Leary.*
Page 324, Case 932, eleventh line, for 1863, read "1864."
Page 324, Case 933, first line, for Tennessee, read *Pennsylvania;* also second line, for 1875, read "1865."
Page 328, Case 957, third line, for U. S. V., read U. S. *A.*
Page 328, Case 960, seventh line, for 1862, read "1863."
Page 330, Case 964, first and fourteenth lines, for 1864, read "1865."
Page 332, Case 972, fifteenth line, for anotomical, read *anatomical.*
Page 336, Case 978, sixth line, for U. S. V., read U. S. *A.*; also twenty-second line, for October 31, read *September* 30; also twenty-sixth line, for Surgeon G. Taylor read *Assistant* Surgeon *J. T. Calhoun,* and omit the word "still."

Page 352, Note 1, third line, for ill, read *il.*
Page 353, Case 1015, second line, for B Bache, read *D.* Bache.
Page 360, seventeenth line, for rectal-urinary, read *recto*-urinary.
Page 361, second case, sixth line, for Hinson, read *Hixon.*
Page 362, third case, fifth line, for C. H. Bates, read C. *C.* Bates.
Page 362, third case, ninth line, for S. F. Sherman, read *B.* F. Sherman.
Page 362, fifth case, fourth line, for J. O. Stearns, read J. *Q.* Stearns.
Page 363, second case, third line, for M. N. Townsend, read M. *W.* Townsend.
Page 363, second case, sixteenth line, for O. Mitchell, read *A.* Mitchell.
Page 363, third case, second line, for Clay, read *Cony.*
Page 364, second case, third line, for Reed, read *Read.*
Page 364, third case, fourth line, for Whitehall, read *Whitehill.*
Page 365, third case, second line, omit the word "Assistant."
Page 366, Case 1065, fourth line, for C. Peters, read *D.* C. Peters; and twelfth line, for McDermott, read *McDermont.*
Page 369, Note 1, for 228, read "288."
Page 371, Case 1074, second line, for C. V. Fowler, read C. *N.* Fowler.
Page 371, Case 1074, ninth and tenth lines, for J. W. Fally, read J. W. *Fatley.*
Page 371, Case 1076, thirty-sixth line, for T. Sherwood, read T. *H.* Sherwood.
Page 373, Case 1083, second line, for J. K. Hasbrouck, read J. *W.* Hasbrouck.
Page 374, Case 1084, fifth line, for J. D. Knight, read *I.* D. Knight.
Page 376, thirty-first line, for anti, read *ante.*
Page 379, fifth and forty-second lines, for U. S. V., read 10*th Ohio.*
Page 379, forty-fifth line, for J. T. Finley, read J. *F.* Finley.
Page 401, first line, for observations, read *observation.*
Page 402, Note 4, for Grippat, read *Gripat;* for vésica, read *vesicæ;* for 1874, read "1873."
Page 403, fourteenth line, for outer, read *inner.*
Page 406, Case 1105, second line, for P. A. Cleary, read P. *J.* A. Cleary.
Page 407, Case 1108, third line, for Thorn, read *Thorne.*
Page 407, Case 1110, sixth line, for testicles, read *testicle.*
Page 408, twenty-fourth line, for J. McCook, read *G.* McCook.
Page 408, forty-third line, for 1863, read "1864."
Page 409, fourteenth line, for T. S. Harper, read T. *J.* Harper.
Page 409, Case 1133, second line, for Acting Assistant Surgeon, read *Assistant Surgeon, U. S. A.*
Page 420, forty-fifth line, for 1854, read "1864."
Page 421, Case 1225, for Surgeon R. F. Weir, U. S. A., read *Assistant* Surgeon R. F. Weir, U. S. A.
Page 422, Case 1227, third line, for F. Sadler, read F. *Salter.*
Page 424, Case A[11], second line, strike out the words "endeavoring to rally," and insert *leading;* also strike out the words "after the mine explosion, June 30, 1864," and insert "April 2, 1865."
Page 437, Note 1, sixth line, for CHEVERS, read *Cheever.*
Page 448, Case 9 of TABLE XIII, for Randolph, read *Bradford.*
Page 448, Case 19 of TABLE XIII, for W. Notson, read W. *M.* Notson.
Page 471, third line of third pica paragraph, after the words "the injuries of the," insert the words "soft parts of the."
Page 475, Case 1417, omit the words "Acting Assistant.
Page 487, Case 1442, second line, for May, read *March.*
Page 489, third line, for patients, read *patient.*
Page 497, the dates of injury and operation, in Case 3 of TABLE XX, should read "June 24, 1864," and the date of death "July 26, 1864."
Page 508, Case 1480, fourteenth line, for H. Heger, read *A.* Heger.
Page 509, Case 1482, tenth line, for Marshall, read *Marshal.*
Page 529, first and second lines, for two hundred and seventy-three, read *one hundred and twenty-five.*
Page 542, seventh line of pica, for interior, read *anterior.*
Page 607, eighth pica line, insert after "are" the word "partially."
PLATE XLVIII, facing page 782, second line of title, for Humerous, read *Humerus.*
Page 783, ninth line from bottom, for Gourley read *Gouley.*
Page 902, second line of pica, for methods, read *method.*
Page 918, Case 1843, second line, for U. S. A., read U. S *V.*
